It was a good while before we reached home, and I expected to find all the squirrels ready for a taxidermist, but on opening the handkerchief they were apparently all right. Then came the problem of how to feed them. We took a glass fountain-pen filler and fed them warm milk, and by their third meal they had learned to stretch out their little paws, clutch the glass and hold on until their hunger was satisfied.

They grew very fast, but did not get their full growth until we had had them about eight months. We fed them on acorns, nuts and yellow corn, and they always drank milk, refusing water on all but very rare occasions, when they let their desire for it be known by chirping loudly and persistently until we gave it to them.

We tried all sorts of foods on them, and found them very fastidious. They would eat a little sweet apple with great relish, but always refused any sour ones. They were fond of parsley, but that was about the only green thing they cared for, with the exception of pansy flowers and apple-tree twigs. The latter they would devour with great avidity, bark, leaves and everything but the inside wood, which they left as clean and white as a toothpick.

In their wild state they must consume a great deal of animal food. This is a fact which the natural histories tell us. We tried various things, and found that they had a distinct choice in meats as well as in vegetables. They liked nearly all moths, although the few which are unfortunate enough to emit an unpleasant odor they sniffed

FLYING SQUIRRELS.

at and left. They would make a lightning-like spring at a moth, seize him so the dust from the wings would not trouble their breathing apparatus, and then bite off the head; then the body followed, and soon only the wings and a few legs remained.

They refused crickets, but delighted in grasshoppers, preferring the kind "with a plentiful supply of molasses," as Mr. Gibson speaks of them. They were very careful to hold these dainties so that the long legs would not kick, and the head was eaten first, as in the case of moths. Occasionally they would catch and decapitate a fly, but it never seemed that they wanted to eat it. Flies simply exasperated them, and they killed them as we would—to get rid of them. They like sugar, and crunch it like children. Chestnuts they only eat when starved to it, and while they eat a few walnuts, they like better than anything else besides acorns, filberts and pecans.

There were three males and one female. The latter was the largest and best developed of the four, and by far the handsomest.

As it neared spring, we wondered if the little lady would reward us by adding to our stock of squirrels, but everybody said it was unheard of for flying squirrels to breed in captivity, so my surprise can be imagined when, on March 25, 1898, I found in the cage the little lady cuddling three little pink things, for all the world like baby mice. We did not dare leave them in the cage at the mercy of the other three, so she and her family were moved into a large box and placed in the house. We tried to coax her to eat, trying all sorts of delicacies on her, which had never before failed to please; but her pride in those red mites was funny.

Suddenly she got up and came to us as usual, and let us pet her, and then began a funny sight. All the four had shown a great fondness for a closet in which hung some of my old clothes, and she took up the little things, one at a time, patting them and folding them up into little parcels, and moved them into the pocket of a pair of trousers. We gave her cotton, of which she made a bed, and she seemed quite contented there. The little fellows did not get their eyes open until they were twenty-five days old, and were not fully covered with fur until even later. When the weather became warmer we made her a small cage, and placed it on the piazza beside the large cage. She had shown uneasiness for some time, and seemed to crave something she could not get, and one morning we discovered that she had gnawed a small hole

in her cage and was gone. She had stopped on the piazza to eat half a nut and to pick and partly eat some pansy flowers, of which she was always fond. We waited as long as we dared for her to come, for we thought she would return to her babies, and then we began to feed them as we had the older ones.

In several days we found her remains some distance from the house, where a neighbor's cat had killed her. The little ones grew very fast, and did not seem to miss the mother.

We had considered the others tame, but these were as tame as little kittens would have been under the circumstances. In early June we took the older ones into the woods and left them where we had found them the year before, thinking the younger ones all we could manage. We had neglected to pet the big ones in our care of the little ones, and expected they would be glad of their liberty, but found that, on the contrary, they were quite loath to go. The little ones we took with us to the seashore in June and kept them there until October, and they seemed none the worse for their summer outing. They were not quite as large as the older ones were, but perfectly developed and much handsomer. They are also better tempered, and while we keep them generally in their cage, we occasionally give them the run of the house. Of course, they have comparatively little opportunity to use their so-called wings in the house, the highest jump they can manage being from the top of a door. They sail out into the middle of the room and light with a little thud. Their persistence when once an idea gets into their little heads is funny, and their bump of locality is wonderful. I have seen them try to go through a curtained doorway, and finding the curtain carefully pinned, jump down and run around through three rooms to reach the opposite side of that curtain. If they see anything they want, no matter how many times we take them down, they climb up again and again until they reach the desired article. A vase of carnations furnishes them unending delight, and unless we shut the vase away from them they pick the flowers from the stem as neatly as if cut with a pair of scissors, and pull them in pieces to get the honey at the base of the petals.

I have repeatedly seen them jump perpendicularly from the floor to a door knob, and sit there with hardly an

effort to keep their balance. No article of furniture is too smooth for their feet. They can climb anything that is round, no matter how highly polished. They show their wild nature by collecting all the nuts—bits of toast even—and corn they can find, and hiding them in different places. They dig in the fringe of rugs as if in pine needles and tuck in their food, patting it down in a very cunning way. The other day I took several volumes of the Encyclopedia from the bookcase, and found ranged behind the books in neat little rows about a dozen small, black acorns, and a large piece of toast which one of the little rogues had stolen from the breakfast table. When we are at meals they come and taste all of our food, and if we have any cereal with cream they eat quite a quantity. Their curiosity is very strong, and sometimes they suffer for it.

One day one burned his paws on the coffee pot, and another singed her whiskers over a lamp, the shade of which she persisted in climbing. On the whole, however, they have been very free from accidents, and they have certainly been the most satisfactory pets we ever had. It is difficult to say whether they are affectionate to human beings or not. I have had all of them remain on my person just as long as I would maintain an upright position, either walking about or standing still, and they seemed fond of me; but when I sat down they would scatter, running back occasionally, but not stopping long, although they can almost surely be induced to return by one's "squeaking" with the lips in imitation of their sound, or scratching one's clothing. They never bite unless very much angered, but their claws, however small and innocent looking, are capable of inflicting quite a painful scratch. However, they do not scratch intentionally; but in jumping from some object to one's person are not always particular whether they light in his face or on his clothing. I have always kept them in a wire cage about 3ft. long and 2ft. wide by 2ft. high, made of wire netting of about the 8in. mesh. This is always kept out of doors, regardless of the weather, although during storms of rain or snow it is always well covered. Sometimes they have taken up their abode in a long gingham bag, partly full of cotton batting, which they always shred up into small balls. We had often to clean out the bag, for in a few days, from being partly full, it would be so full that heads and tails hung out at the top and at the bottom too, where they had made an opening to serve as another door, for they carried nuts and acorns to bed

and slucked them there, mixing the shells with their cotton. We would never have thought of giving them a bag for a bed if they had not appropriated a large duck bag which I needed for my soiled collars and cuffs. They refused to leave it unless compelled, and seemed to think the starched linen comfortable enough. That bag would be the first place they sought when they were allowed in the house, and if left to themselves they were soon asleep in it.

Some of the collar corners did not present so good an appearance after their sojourn there, for they will nibble a little, although they do much less damage than might be expected.

They had much sport with a dry, yellow birch stub, dry and rotten to the core, which I put into their cage last winter. This was soon burrowed into, making little cavities on all sides, which they now began to occupy singly, although they had always slept together before. By spring there was nothing left of the stump but a mere shell, as they had tunneled it in all directions, and when we attempted to remove it from the cage it fell in pieces. This year they are occupying an old Fedora hat, which lies flat on the cage floor and is full of cotton.

Their mode of ingress and egress is through the top, in which they have gnawed several large holes. As is probably well known, these animals are by habit nocturnal, consequently unless a special effort is made it is hard to arouse one during the day, while during the evening they are so lively that we always leave them in the cage, unless we are quite sure no stranger will come in. Even when we are alone they are a good deal of care after dark, and we consider the cage safest for them. I believe they remain awake about all night, as they can be heard gnawing nuts at almost any hour.

While the little fellows are very timid, and the slightest motion of the hand or a sudden noise will startle them for a second, they have become so accustomed to the noises about the house that practically the only one which causes them more than a second's fear is the broom.

That they do hate cordially, as did the older ones before them. In this litter are two females and one male, and we are looking forward with interest to the rearing of two rival families in the spring. This time we hope the little ladies may not shirk their duties, for we must have lost the most interesting part of their babyhood in not seeing the mother teach them to jump, and do the thousand and one pretty things which they had to learn by themselves. I have given our experience, which has proved a great pleasure to us, and I would dearly like to know if some one else has not studied flying squirrels too, so that we could compare notes. C. C. H.

Birds in London.

We are accustomed to think of great cities as wholly given over to the arts of civilization, and as quite lacking in anything pertaining to untouched nature. Nothing can be more artificial than the conventionally shaped beds of bright flowers which adorn our parks, and even the grass and the trees are trimmed and tended until they become quite unlike the real thing. Of all cities on the globe London is the vastest, and yet now a book has been written on wild "Birds in London," and a most interesting volume it is. Mr. W. H. Hudson is the author, and his volume of more than 300 pages is beautifully brought out by the Longmans.

Mr. Hudson is a naturalist, who sees what goes on about him, and better yet, who is able to tell his readers, in common language, "understood of the people," what it is that he sees. We might imagine that a horde of sparrows would be the only feathered inhabitants of this great city, but the truth is very different. To say nothing of the smaller creatures that require a little space to live their lives, we find existing in London the carrion crow, a bird closely allied to our own common crow; rooks, wood pigeons, blackbirds, thrushes and English robins, with herons and many other species. Then in the parks there are the dabchick, a sort of grebe; the moor hen, a gallinule, and gulls, besides many varieties of domestic and introduced birds. Even wild geese have been seen in winter. Besides these, during the migration, there are many birds in London that the common eye never sees. "At this mutable season a person who elects to spend his nights on the roof, with rugs and an umbrella to keep out cold and wet, may be rewarded by hearing far-off shrill delicate noises of straggling sandpipers or other shore birds on passage, or the mysterious cry of the lapwing 'wailing his way from cloud to cloud.' All these rare sights and sounds are for the various patient watchers and listeners; nevertheless they are the only 'authentic tidings' the Londoner receives of that great and wonderful wave of life which travels southward over half the globe in advance of winter."

Many most interesting facts are set forth by Mr. Hudson in his interesting volume. For example, he tells us that the carrion crow is in the balance in London, neither increasing nor decreasing. While many of them feed along the shores of the Thames at low water, picking up food left by the tide, many others feed on scraps of food which are the waste of London tables. In the southwest district of London crows may be seen sitting like domestic doves on the roofs and chimneys of the tall houses. But little seems to be known in England concerning the extraordinary intelligence of the crow in captivity, a subject which is familiar enough on this side of the water.

One of the birds which has recently invaded London is the wood pigeon, or ring dove. "Twenty years ago," says Mr. Hudson, "the wood pigeon was almost unknown in London, the very few birds that existed being confined to the woods on the borders of the metropolis and to some of the old private parks. * * * But from 1883, when a single pair nested in Buckingham Palace Gardens, wood pigeons have increased and spread from year to year, until the present time, when there is not any park with large old trees or with trees of a moderate size where these birds are not annual breeders. As the park trees no longer afford them sufficient accommodation, they have gone to other smaller areas, and to many squares and gardens, private and public. Thus in Soho Square no fewer than six pairs had nests last summer. It was very pleasant, a friend told me, to look out of his window on an April morning, and see two milk-white eggs, bright as gems, in the sunlight lying in the frail nest in a plane tree not many yards away." Not only this, but the wood pigeons have spread through the heart of the

busiest districts of London, where they build their nests and rear their young in the large trees. Here they perch on the chimneys and on the statues, and walk about on the pavements looking for food.

Besides his remarks on the birds occurring in London and on their ways of life and the particular sections that certain species inhabit, Mr. Hudson treats also of protection of birds in the London parks. For he declares this to be a book with a purpose—the pointing out among other things of the extreme pleasure that the city dweller takes in seeing and hearing wild birds, and the consequent value of bird life. He notices that many species commonly resident throughout the year in London have quite died out, enumerating among the larger kinds the raven, magpie, peregrine, falcon and kestrel, as have also a number of smaller species, and that some birds still residing there are reduced in numbers and confined to one or to very few spots; that while many other resident species have greatly decreased in numbers, two small birds, the sparrow and the starling, have increased, while some species have recently come into London from the outside. Also during the migrating season many birds temporarily get into London; some of these, which are summer visitors, having regularly bred there up to within a few years. Thus the bird population of London is

WOOD PIGEON ON THE SHAKESPEARE STATUE.

constantly undergoing changes, many species decreasing, while some are increasing. Mr. Hudson urges that wild birds should be encouraged to make their homes in the parks, that they should be protected from injury by any sort of enemies, and that, so far as the birds are concerned, the cat is a tremendous nuisance. The author estimates by his own observation that the entire cat population of London does not fall far short of three-quarters of a million. All of these cats are by nature hunters, perhaps one hundred thousand of them are starving as well. It is not extraordinary then that these animals are a tremendous check on any increase in bird population.

Much more might be said of this extremely interesting book, which shows so well how much of nature is to be seen even in the most unlikely places, provided only the observer has eyes to see those things which are hidden from so many others.

The book is illustrated with seventeen full page plates, and almost as many illustrations in the text, which add much to its interest. In all that pertains to its manufacture it is worthy of the firm who are its publishers.

Of the species which have established colonies in London during recent years, the wood pigeon, or ring dove, is the most important, being the largest in size and the most numerous; and it is also remarkable on account of its beauty, melody, and tameness. Indeed, the presence of this bird and its abundance is a compensation for some of our losses suffered in recent years. It has for many of us, albeit in a less degree than the carrion crow, somewhat of glamor, producing in such a place as Kensington Gardens an illusion of wild nature; and watching it suddenly spring aloft, with loud flap of wings, to soar circling on high and descend in a graceful curve to its tree again, and listening to the beautiful sound of its human-like plaint, which may be heard not only in summer, but on any mild day in winter, one is apt to lose sight of the increasingly artificial aspect of things; to forget the havoc that has been wrought, until the surviving trees—the decayed giant about whose roots the cruel, hungry, glittering axe ever flits and plays like a hawk-moth in the summer twilight—no longer seem conscious of their doom.

Twenty years ago the wood pigeon was almost unknown in London, the very few birds that existed being confined to woods on the borders of the metropolis and to some of the old private parks except two or three pairs that bred in the group of fir trees on the north side of Kensington Gardens, and one pair in St. James' Park. Tree-felling caused these birds to abandon the parks some time during the seventies. But from 1883, when a single pair nested in Buckingham Palace Gardens, wood pigeons have increased and spread from year to year until the present time, when there is not any park with large old trees, or with trees of a moderate size, where these birds are not annual breeders. As the park trees no

longer afford them sufficient accommodation, they have gone to the other smaller areas, and to many squares and gardens, private and public.

Even in the heart of the smoky, roaring city they build their nests and rear their young on any large tree. To other spaces, where there are no suitable trees, they are daily visitors; and lately I have been amused to see them come in small flocks to the coal deposits of the Great Western Railway at Westbourne Park. What attraction this busy black place, vexed with rumbling, puffing and shrieking noises, can have for them I cannot guess. These doves, when disturbed, invariably fly to a terrace of houses close by and perch on the chimney-pots, a newly acquired habit. In Leicester Square I have seen as many as a dozen to twenty birds at a time, leisurely moving about on the asphalted walk in search of crumbs of bread. It is not unusual to see one bird perched in a pretty attitude on the head of Shakespeare's statue in the middle of the square, the most commanding position. I never admired that marble until I thus saw it occupied by the pretty dove-colored quest, with white collar, iridescent neck and orange bill; since then I have thought highly of it, and am grateful to Baron Albert Grant for his gift to London. I heartily wish that the birds would make use in the same way of many other statues with which our public places are furnished, if not adorned.

So numerous are the wood pigeons at the end of summer in their favorite parks that it is easy for any person, by throwing a few handfuls of grain, to attract as many as twenty or thirty of them to his feet. Their tameness is wonderful, and they are delightful to look at, although so stout of figure. Considering their enormous appetites, their portliness seems only natural. But a full habit does not detract from their beauty; they remind us of some of our dearest lady friends, who in spite of their two score or more summers, and largeness where the maiden is slim, have somehow retained loveliness and grace. We have seen that the London wood pigeon, like the London crow, occasionally alights on buildings. One bird comes to a ledge of a house front opposite my window, and walks up and down there. We may expect that other changes in the birds' habits will come about in time, if the present rate of increase should continue.

The Passenger Pigeon.

NEW YORK, Feb. 9.—*Editor Forest and Stream:* In your issue of the 11th, under the head of "Snap Shots," you speak of the passenger pigeon, and surmise that the name may have come from the irregularity of its migrations. These statements are so at variance with my own experience that I venture to write you.

When a boy, in the late forties, I spent most of the time on my grandfather's country seat at Manhattanville, on the North River. I spent all my leisure in fishing and shooting. There was good bass and weak fishing in the river, and many quail and woodcock on the hills along the North and Harlem rivers.

The wild pigeon, known only by that name, flew south on both sides of the North River by the thousands in the fall, and in lesser number flew north in the spring.

These migrations occurred with the utmost regularity. The first easterly storm after Sept. 1, clearing up with a strong northwest wind, was as surely followed by a flight of wild pigeons as the sun was to rise. During such storms I have passed many a sleepless night watching to catch the first change of wind, and when it veered northwest daybreak found me on the river bank watching for the flight that never failed. Ah! how my heart jumped as flock after flock of wild pigeons came flying over Fort Washington like small clouds. I have shot a great many of them, but alas, like the buffalo, they are almost exterminated. F. N. LAWRENCE.

KALAMAZOO, Mich., Feb. 3.—*Editor Forest and Stream:* Your article "The Wild Pigeon" reminds me I can throw some light on them by an incident happening to me four years ago, when out for turkeys in a large swamp twenty miles west of this city.

This piece of inaccessible swamp is nearly thirty miles long by one to five wide, wooded in parts heavily, on high spots, and thick with undergrowth.

I was in a fence corner adjoining a cornfield before daylight; my companion was in a corn shank. At just daylight, as we were expectantly looking for the turkeys that didn't come, a pair of bluerock pigeons flew from the swamp. The cock lighted on a shrub, and the dove on the ground within 10 ft. of me. I would not have shot this beautiful bird for any price, and was most fearful my companion might not have the sentiment I had; but he did not shoot. As they cooed to each other, this beautiful pair of an almost lost race, how sweet the sound. Over me swept memories of my boyhood days when they nested near here, and the great clouds that passed morning and night to and from their Ohio feeding grounds. The old musket I so fondly cherished in those days, the best shooter in Michigan, about 12 lbs. weight, more or less, was again before me. How inferior the pleasure I got with my 12-bore hammerless. Those days—care free, plenty of game, poor gun. These days—no game, good gun, too busy to hunt. Shoot those birds? I would as soon have shot my companion. They were a ray of sunshine through the leaden clouds.

Well, I'll put up my topsail and say what I started to say, that I recently heard direct from Venezuela, S. A., that the wild pigeons in great quantities were in the heavy forests of that country. G. H. W.

Field Columbian Museum.

THE annual report of the Director to the Board of Trustees for the year ending Sept. 30, 1898, contains much that is interesting. The story told is one of continual progress, of steady and systematic scientific work, of increasing collections, and a larger exhibition of material to the public view than ever before. The lecture course carried on from October to April covered a whole field of interesting subjects.

The year has been bountiful in accessions to the treasures of the museum by purchase, by collection and by gifts. The expeditions made by the different curators have covered a wide territory, that of Mr. Elliot to the Olympian Mountains, and of Mr. Dorsey to the North-

west and Southwest, having yielded results of great interest.

The Field Columbian Museum is doing a great work, the importance of which is continually increasing. This handsome and beautifully illustrated report gives an interesting account of it.

A Rabbit Frightened to Death.

Editor Forest and Stream:

In Mr. Fred Mather's article of last week he mentions the fact of rabbits dying from fright. My period of experience has been but a drop in a bucket as compared with Mr. Mather's. However, upon two occasions I have known rabbits to die of fright. And while walking through the fields with a friend, armed with an old musket, he had shot at a hawk and was reloading as we walked along. I had in my pocket a paper bag of shot. The powder was rammed home, and while fishing for the shot to expedite matters he fitted on the cap. At that moment a rabbit started out of a patch of high grass and briers in front of us. Jack raised the old musket, and not waiting for the shot, which I held in my hand, took a snap shot at about 20yds., and the rabbit rolled over. We thought, of course, the wadding had been aimed, balled and struck the rabbit in the back of the neck. That was not possible, for we found the pieces of newspaper which comprised the wadding laying about near where we stood.

CHAS. G. BLANDFORD.

A Big Snake Killed in Manila.

From the Manila American Soldier.

In posting his relief the other morning, Corp. Walker came upon a large snake of the constrictor species in front of the officers' quarters on Calle de Palacio. Surprise was mutual. No command was given, but the relief squad was instantaneously deployed as skirmishers and then scarcely in time to avoid the vicious strokes of Br'er Snake, who would strike at a distance of 6 and 8 ft. However, these islands are ours, and the enemy went where the good snakes go. On being measured, the snake was found to be 9 ft. 7 in. long and 10 in. around in the largest part, with fangs like a panther.

Game Bag and Gun.

Red Letter Days.

II.—Grouse Shooting.

"It's the unexpected that happens!"

Who can adequately describe that queen of sport, to be got in the mountain wilds and healthy moor of the British Isles—grouse shooting? It is at the disposal of the favored few, those who have inherited this not common kind of territory from their forefathers, or those who can rent such lands from the poor, and not proud, landlords from well filled purses. The more therefore do you appreciate, when you get it, the autumnal shoot, commencing the 20th of August on the grouse moor.

The party, limited in numbers, consists of none but keen and skilled sportsmen, able to rough it in mountain hut, or on mountain side or moor.

Red, Irish or Gordon setters (pointers are not suitable) must be carefully selected, for strength and training, able, if possible, to beat the mountain from morn till eve. Failing which a waiting batch of setters have, as a rule, to be produced at midday to relieve those unfitted for a whole day's work.

How refreshing the morning bath in cool mountain stream! How enjoyable the early breakfast, and the chat with the keeper, as to the prospects of sport, the number of birds and their strength in the different packs, and as to the modus operandi of the day. Then the start. You climb the mountain with springy step, without the aid of Alpine stock, or without that hideous modern invention—the funicular. How clear the air—the sanitation is perfect. How picturesque the view from each succeeding vantage point the higher you climb—if not fit and fresh in physical training the longer you pause, "merely to admire the view," the higher you climb. Beneath, at your feet, lies a vast belt of green, seen through clefts in rain clouds, spreading low along the pasture lands, above and around lies a broad waste of purple heather, interspersed with yellow gorse. At last the highest point of highest mount is reached.

At this point we divide our force, two guns and two keepers, with batch of setters in each party. From this point each party takes the route previously decided upon, each gun, right or left, as decided. Onwards we move in solemn silence. It is a picture to watch the setters "quartering" the ground, brushing the dewdrops from the heather as they move cautiously to "get the wind" of the ground in front. At first they may be somewhat wild, but soon they settle down to steady work. A whistle sounds to attract their attention, and a wave of the hand points to the required direction of the beat. A perfect picture, too, to watch them in their approach to game. One setter backing the other, as, with extended head and neck, the least scent is floated toward them over the thick heather. How cautiously they move, step by step! It is a study of animal life! The gunners, too, eagerly follow every move. Suddenly up goes nose and head of the leading setter. Something is at fault. A cast is made by both dogs without wave of hand or sound of mouth. This is evidently a running single bird, an old cock grouse—not a settled down pack. Soon fresh scent is found, succeeded by the careful following up, with quickened pace, by dogs and men, and soon there is the well-known sound of the old cock as he rises from ambush, almost out of shot. No. 12 choke-bore, No. 5 shot, "normal powder," the gun held straight and the work is done. The first grouse of the season. The finest specimen of game that flies comes down with a "thud," and is picked up by the keeper. No noise or excitement on the part of men or dogs, the latter remaining at the "down charge," waiting the order for the forward movement.

This goes on, varied by the coming upon a pack of grouse instead of a single bird, from time to time, until

the general meet for lunch at the spot previously decided on, near cool spring, or on bank of mountain stream. Here a delightful half-hour for refreshment is spent, with the comparing of notes as to the extent of the bag, etc. The afternoon shoot, with perhaps a change of setters, is similar to that of the forenoon.

The general gathering in the evening is a happy event. Landlord and tenants meet, as they should, on the best of terms. Host and guests meet for the evening meal and to talk over the doings of the day. Every detail of the day's sport is a topic of conversation. Plans for to-morrow are made before turning in to sleep the sleep of the weary.

It was my good fortune in my early youth to be one of the party at the yearly shoot on a certain mountain property in the south of Ireland, rejoicing in the poetic name Tourinegrana. My education, therefore, in the knowledge and practice of gunning had not been quite neglected. Duty, however, that stern disciplinarian, required my presence in distant lands; grouse and grouse shooting therefore were to me things of the past, out of sight, though not out of mind, till the whirligig of time, with many a change and chance, brought me back to scenes of my youth. Again I had a "bid" to form one of the party of four on the ancestral property, with grouse in prospect. The 20th of August the time. Again there was the preparation for the start. The usual drive on Irish car to the distant mountain, far from the busy haunts of men; again there was the usual forecast of the total bag, as well as of the result of the skill of each individual of the party.

All save myself being skilled gunners, each with an enviable record of his own in making a bag, I alone remained silent. I was quite "out of the betting." I had no record except of big game in forest or on prairie to boast of. My hand had surely "lost its cunning" in small game shooting.

However, "here we are"! This is the old familiar mountain! Here are the old familiar faces of keepers and tenants! This man marked where fell my first—wounded—grouse. That man had shown me where to find my first woodcock. Another had taught me how to slip greyhounds on the wild mountain hares.

All welcome their old master, returned from distant lands. All look upon me with sympathy, as having lost so much sport owing to absence from the yearly shoot, and in consequence as being an individual who "could not hit a haystack."

Next morning there were the usual preparations for the start. Then the mountain climb. How pure the air. It is nectar! How delightful the feeling of freedom! There to shake off the cares of life in this work-a-day world! Here to feel once more "at home"! Yet not quite "at home" with these new surroundings. Irish setters, Irish keepers, with a keen and skilled gunner at one's elbow, ready, even without any jealous shooting, to "wipe your eye" on your even "miss." But, "what's this"? The setters at a steady set! It's surely an old cock grouse, not a running bird. He gets up within range with notes of alarm, to warn his comrades far and near, and quite sufficient to alarm and upset the nervous system of any novice. How well he flew round to my side; no doubt as to whose bird; I cut him down, to my surprise, with an inward feeling of "that's not too bad," and an outward feeling, amongst all, "The foreigner has been keeping his eye in somewhere." "This, however, may be a fluke."

We move on. Soon there's another steady set, then the usual working up to the supreme moment of the "rise and fall" of grouse. This time we're in a pack of grouse. Again I'm in luck, the birds fly round to my side. I account for "right and left" shots. My "pal" gets but one bird. So far there is a "balance credit" to my account. This success—or luck—goes on till lunch, when we compare notes with all gunners. To my joy, I, the "dark horse," the "wanderer from the fold," top the score; I am congratulated on all sides.

This, however, is but a temporary success. After lunch we move on. This sort of thing cannot long continue. All are now "on their metal." My "balance credit" must be cut down, and yet we had not gone far before I observe a bit of ground, which, in my feeble judgment, the dogs had not quartered. I walk it up, when, lo! an outlying old cock grouse tries to "sneak off" without any warning notes. I quickly cut short his concern; he falls to the ground with a "thud"; I reload, with a look of serene indifference, but with indescribable joy at heart. This is followed by a series of successes, with the result that, at the evening gathering and comparing of notes, I "take the palm," and am looked upon as "the hero of the hour." I may add that on the following day my hand and eye are again "in"—fortune again smiles—and on the return to "the settlements"—to the house and home of the landlord—I, "the alien," "the foreigner," have "scored," and have thus unexpectedly and unaccountably added to my stock of "red letter days."

Truly, "'Tis the unexpected that happens."

FREDERICTON.

Another Remarkable Shot.

Editor Forest and Stream:

Mr. Peter Flint's story, "Shots that Happened So," in Feb. 4 number reminded me of a remarkable shot, which probably never happened with any other person. Two days before I started on my hunt with Gen. Brooke, described a few weeks ago in these columns, I went out on a good tracking snow to replenish the larder. I started up Beaver Creek early in the morning, where I was generally sure of finding deer on the early tracking snows. After going about three miles, I found the trail of eight deer, made the day before. Following rapidly for an hour, I found where they had taken up their abode for some time along the side of the mountain, judging from their beds in the snow, and the territory over which they had pawed the snow for feed. Circling around their feeding ground, I soon found their trail, which had been made that morning, leading toward the creek. I kept on at a good gait, until I found the trail getting fresh, then slowed up and followed cautiously where they had been feeding.

The trail finally led across the creek, where I found I was only a very few minutes behind them.

Moving but a few steps up the creek, I saw a part of

one body through some alder bushes. The next report was that of the .45-90. I could see the deer make one jump, and it was out of sight. They knew not where the disturbance came from; one came dashing out past me and stopped at short range. I shot, and it was out of sight after making a few jumps. By this time another one, which had run away some distance, came back straight toward me, and stopped at a good distance, with its breast directly toward me. I fired at it and it never moved. I fired again, and it just did the same thing as before. I "pumped" for the third cartridge, and it wasn't there; the magazine was empty. Taking a cartridge out of my belt I shoved it into the barrel just as the deer disappeared in the woods. Just let me pause here to say that such moments as that when the hunter stands alone in the wild evergreen woods with no one nearer than several miles, the ground well covered with snow and the beautiful gray-coated deer scurrying here and there over the white surface, now in sight and then gone into the friendly shelter of the woods, are moments of supreme delight, which linger long and fondly in the memory, and are pleasant to recall.

Finding they had all deserted me, I went first where I had shot at the first one, and found it a few yards from where I had shot it. I dressed it and went after the one I had shot at short range, and found it near by. Then I went where the last one had stood while I shot at it. There I found great quantities of hair on the snow, which suggested to me that I had shot close enough to shave the hair off without doing it any injury, since it had not moved when I shot. I started on its trail and followed but a short distance till the tracks of another one joined it. The two traveled together for half a mile, then separated. There was no way of distinguishing between the tracks of the two deer. One went directly toward home, and, of course, I followed it, for it was getting well along in the evening. Finding it going into a dense growth of spruce along the edge of some old beaver dams, and winding about in an aimless sort of way, I kept a sharp lookout and saw it standing about 75yds. away, where it had been lying down. I took a quick shot, believing it had seen me, and saw it run, then stagger and fall. On coming to it I found my shot had gone through its heart.

Then it was that I discovered the remarkable shot—the shot that "happened" so.

It was the deer I had been shooting at. The hide was cut open on the back from the top of the shoulders to the rump, fully 2 ft. in length, as clean as could have been done with a knife; not a shred of the hide remaining uncut, and the flesh had not a scratch, and there was no blood drawn. The skin had spread open fully 6 in. on the back, leaving that much of it bare of skin. Of course I felt grateful at being thus fortunate in finding and killing it after learning of its condition. This was the queerest shot of my experience, and what seems so strange to me is that it stood still while getting such a "ripping up the back."

EMERSON CARNEY.

MORGANTOWN, W. VA.

The Lacey Game Bird Bill.

Editor Forest and Stream:

It occurs to me that gentlemen who believe game birds cannot be propagated under human supervision, and therefore that measures like the Lacey bill, now before Congress, are useless, would do well to study a little the history of other parts of the world beside their own miserable little corner.

In everything pertaining to bird-shooting for purely sporting purposes, the people of the United States, however much they may think they know, are comparatively in their infancy. Splendid sport with the birds is entirely consistent with the highest state of cultivation and quite dense population, if the thing is considered worth while. The farming regions of New England and New York, where there is a very high per cent. of the acreage under cultivation, might yield birds in thousands where there now are scarcely any. If you ride from Washington in any direction into Maryland or Virginia, in the spring, you are amazed to see the countless thousands of young domestic poultry. They crowd the mother instinct of the hen very hard in this region, and often give one broad-breasted old clucker thirty-five or forty chickens to hover and rear. I believe it would be easy, in time, to have the country swarm with game birds to nearly the same degree. People do not shoot the chickens they see on a country road. If there was anything like a similar common consent about partridges and quail (the "pheasants" and "partridges" of Virginia), the first great point would be secured.

But the thing I started to say was that in England, where they have forgotten more about game birds than we shall know for a hundred years yet, as well as about how to live your life and have some fun in it, the restocking of covers with birds is a recognized, common, perfectly successful industry. If you will pick up at random a copy of the London Field, or any English sporting paper, you will find column after column of advertisements like these:

THE PLAS CLOUGH GAME FARM, NEAR Denbigh, North Wales, Proprietor, Alfred Jones.—Pheasant eggs booked, fresh and fertile, guaranteed 90 per cent., but not only to guarantee the fertility, but produce strong, healthy, and easy to rear chicks. I have excellent stock of fine healthy birds, and every bird fresh; no old stock. Thirty-five years' experience in breeding and rearing thousands of birds. The old dark ringless breed, 100 pens; a new cross, 150 pens. 100 cocks of cross for sale for pens, and some hens; also wild duck eggs.

PHEASANTS FOR SHOOTING! PHEASANTS for stock!—Large quantity of this and last season's pheasants for sale, cheap, supplied in large or small quantities.—Darvill, The Game Farm, Chartridge, near Chesham, Bucks.

10,000 BRACE HUNGARIAN PARTRIDGES, from October to March; 1,000 Elliott versicolor, reeves, pheasants and foreign waterfowl.—William Jamrach, Stoke Newington, London.

PHEASANTS' EGGS.—ORDERS NOW BOOKED for the coming season. Warranted fresh laid from the

pheasantries; lowest prices on application.—Mansel Lewis, Stradey Castle, Llanelly, Carmarthenshire.

THE "MARKOVER" GAME FARM, STONEY Green Hall, Great Missenden, Bucks.—Capt. A. E. Williams has six hundred very fine one-year-old hen pheasants (first cross with black-necked Hungarians) to sell for stock.—Telegrams "Markover," Great Missenden.

PHEASANTS' EGGS (ORDERS NOW booked).—Capt. Freeman, Manor House, Beckford Tewkesbury, continues to guarantee eggs from his patent pens, which are moved twice weekly. Not only 90 per cent. fertile, but to produce as easily reared poults as the best wild eggs do; highest testimonials on application. Full-wing pheasants for sale.

Those who think that because we have never done the thing we never can do it will doubtless oppose the Lacey bill, and all similar attempts to make our silent covers thrill with whirring wings. Many people, for generations to come, will doubtless look upon anything connected with sport as tomfoolery, unworthy the consideration of grown men. Such people do not read FOREST AND STREAM, and what is therein said will have no direct effect upon them. But to any one who knows aught of game and shooting in other lands than our own the argument that game birds cannot be artificially introduced, on the same general principle as fish are introduced, will have no weight. There are plenty of French-Canadians in Quebec who curse the Government fish hatcheries, and who believe they are the cause of the diminished fish supply. An old man in Tadousac once said to me: "W'en I was leetle boy, de feesh hatchery was no here. De saumons was plenty more as dey is now. Den we all net, we all spear, we all sweep de pools ind de seine. Plenty saumons! Now we can no net, no spear, no sweep de pool. De dam hatchery come and spoil all de feeshin'."

It is on such logical grounds as these that some people would oppose the fostering of game birds.

FREDERIC IRLAND.

CHICAGO AND THE WEST.

A Question of Survival.

My mail to-day brings me a letter from "J. F." of Beloit, Wis., who brings up in course of his comments on an article published in another paper the question of the survival of the sports with rod and gun. That is to say, the writer whom he criticises seems to think that such a question exists, though in reality there is no question at all as to the survival of these sports. They will endure so long as the wind blows, and the water runs, and the sky is blue and inviting, and so long as man is man. A good many fellows try to make us think sometimes that human nature is not human nature, but none the less old human nature keeps right on doing business. The correspondent in question goes on to remark:

"In looking over an old 'Advance,' a Congregational paper, of the date of Aug. 27, 1896, I find an article entitled 'A Word for Vacation.' The writer, a W. G. Gannett, says: 'Fishing and shooting for fun will be among the total abstinences of the twentieth century.' Again he says: 'Think what latent barbarism lies implied in the careless question: "Do you enjoy fishing?"' Meanwhile, in this vacation, as you take the struggling trout from the brook or the dog lays the wounded bird at your feet, let the question drift in: 'Am I enjoying myself?'"

"Is Mr. Gannett a pot hunter? He does not go fishing for sport. Does he go fishing to get a big string or doesn't he go at all? Does Mr. Gannett think that we, who go hunting and fishing, go simply because we desire to spill blood; because we are brutes? Long live the sport of fishing and hunting, and last, but by no means least, the FOREST AND STREAM. And let me ask if Mr. Gannett ever took a 2½ or 3lb. black bass on a 9oz. rod, with 75 or 80ft. of line out?"

Singing Mouse No. 8.

Mr. J. L. Davison, of Lockport, N. Y., has discovered yet another singing mouse, to be added to the FOREST AND STREAM gallery. Under date of Jan. 28 he writes me, "I presume you are an authority on the singing mouse subject. I have just read your note about mouse No. 7 in this week's issue. It would have been No. 8 had I not been delayed in reporting the following incident:

"Recently, while visiting my son in Buffalo, he told me of a singing mouse he heard in the Delaware Avenue Methodist Church one evening during the summer. He was sitting opposite a heat radiator in the floor of the aisle, from which came the singing, and it could be heard all through the services, excepting when the organ was being played and choir singing. His wife was one of the choir, and when he told her that he had never heard such singing as he had that evening, she supposed that he was complimenting her, little thinking that it could be construed to a different meaning, and still less, that the singing was of that dreadful thing, a mouse."

Singing Mouse No. 9.

Mr. B. E. King, of Saginaw, Mich., is still later with a singing mouse story. Under date of Feb. 1 he writes me as below regarding the ninth and tenth instances of a singing mouse which has come to my personal knowledge. When I wrote my book, "The Singing Mouse Stories," I had known of but two instances of this quaint little animal, and I did not know there were so many in the world as we have been hearing about since that time. FOREST AND STREAM is a great developer in the fields of natural history. Mr. King goes on to say:

"Something over a year ago I had occasion to make some purchases one evening at a small corner grocery near my residence, and while being waited upon I was attracted by singing similar to that of a canary, that seemed to come from back of the goods on one of the shelves. On closer inspection we discovered it was produced inside the wall, between the studdings. The young man tending the store and I listened to it for some ten or fifteen minutes, when it stopped. I waited and listened quite a while longer, hoping to hear more, but was disappointed."

"I have inquired a number of times since at the store,

GREEN AND WICKS ARCHTS

but they tell me they never heard anything like it before or since. The tones were very clear, soft and sweet, and most pleasing to hear."

Singing Mouse No. 10.

"On going home that evening," continues Mr. King, "I mentioned having heard a singing mouse to my wife, and she told me of one her mother often spoke about that used to come out sometimes evenings and sing on one of the dressers in a bedroom at her old home in Utica, N. Y."

"This was a very small, little mouse, and he would sit up on his hindquarters and sing very sweetly after eating his fill of dainties placed there for him; but he soon disappeared, no doubt a victim to the enterprise of the family cat."

Footwear and Mackinaw Clothes.

I have been relating something of the trials of my friend, Mr. McChesney, in trying to get himself and friends a few pairs of leather-topped rubbers for snowshoeing. I sent him a letter from a gentleman out in Eau Claire, Wis., who said the leather top was an Eau Claire invention, and could be obtained there. I have yet another letter on this same head from Dr. W. M. Waterman, of Chicago, who writes: "The best rubber shoe with leather laced top, with roll edges, etc., I have obtained from Phelps, Dodge & Palmer, a wholesale house in Chicago. These are lighter than the Gold Seal rubbers. I must call and relate my trip after deer and moose in Minnesota."

Meantime I continue to hear wails from Mr. McChesney, who says that he has sent to St. Paul for his rubber shoes. He has seen some other rubber shoes which he thinks will fill the bill, and is out after duplicates of that pattern. More than this, Mr. McChesney is in trouble about some Mackinaw clothes. He writes me very feelingly as below:

"There is another item of woods rig that I wish you would get for me, or put me in the way of getting, and that is a Mackinaw suit, jacket and trousers. You know the rig well enough, but we cannot get them here. Last year I had quite a correspondence with the Peerless Manufacturing Company, of Detroit. They sent samples of goods, but none were suitable for a hunting rig, as I had no desire to put on mourning, neither did it seem proper to dress as the bounding zebra or wear colors that outdo the rainbow. A couple of years ago a friend secured for himself in Alpena, Mich., a jacket of light snuff color. It did have some red spots, but they were not large or bright enough to spoil it as a shooting coat. You know as well as anyone what colors in brown or gray would be suitable, and if you can have a suit of proper shade sent me, I will wear it in memory of you. Coat 40 breast measure; pantaloons not less than 33 waist and about 33 leg, inseam, or over. This you may guess is not

my normal size, but is an estimate of growth caused by sufficient layers of shirts. My ordinary old clothes are all right in ordinary weather, but sometimes, as you know, one wants many layers of non-conducting substance over him, and a jacket over all. I want to try the Mackinaw if proper colors can be had. Jack Monroe had a good gray color last spring. I nearly said good suit, but it had really passed its prime."

In regard to wool clothing for winter wear, it is good advice to get it big and get it with a belt. I shall never forget the trouble experienced by Mr. McChesney out in the Blackfoot country. He had brought along an old pair of trousers, which he thought would serve his purpose admirably, but which he found so small that he could only get two or three of his heavy shirts inside of them. His other shirts he had to wear hanging down outside his trousers. I have some very interesting photographs of him so clad, of which I will sell copies at reasonable rates. We had to send out to Kalispell, Mont., to get Mr. McChesney the Mackinaw suit he wanted. I could not find the right color here in Chicago, and I do not wish to offend my friend's aesthetic taste. But now, is it not strange that some of our sporting goods dealers do not take hold of and handle these very two articles over which we have been having so much discussion, Mackinaw clothing and snowshoe rubbers? These are goods sold mostly in the pine woods and mountain countries. I fancy a dealer might do some trade through the advertising columns of FOREST AND STREAM if he should offer these very useful articles for winter outdoor wear. If Mr. McChesney does not get outfitted by next Fourth of July in these particulars, I shall be very much troubled, but will keep on trying.

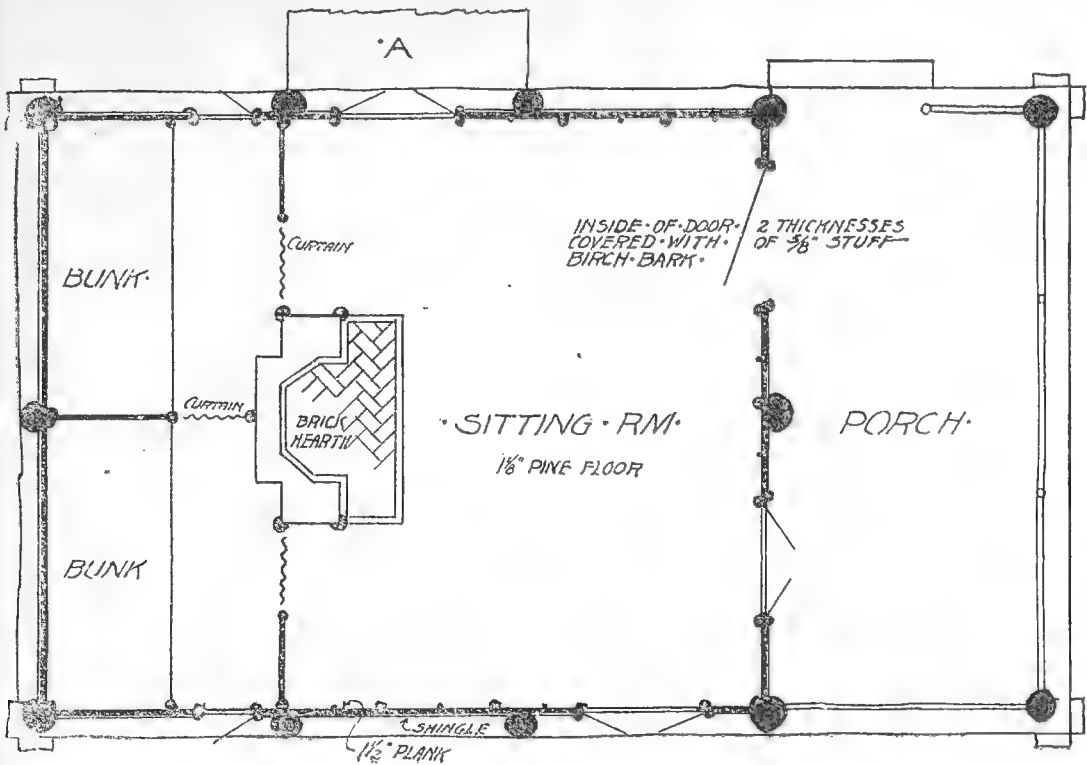

E. HOUGH.

A Woods Sleeping Cabin.

This structure is one of a group of three similar ones erected in the Adirondack Mountains, and forming a summer camp. The central building is used for dining room and kitchen. The wing buildings, similar to the drawing shown, are placed at either end and separated each from the other a small distance. The outer buildings may be easily joined to the dining room building by a small connecting passage. The dining room and kitchen building we will illustrate in later editions of our journal.

The building here shown may be used as an independent lodge or connection with some club house. If not large enough the bunk space and sitting room space may be proportionately increased in length.

The frame is made of logs, put together in the usual simple fashion, the spaces between the logs filled in with 1½ in. thick planks. The planks are toe-nailed to the sill or plate pieces, or other timbers, and covered with

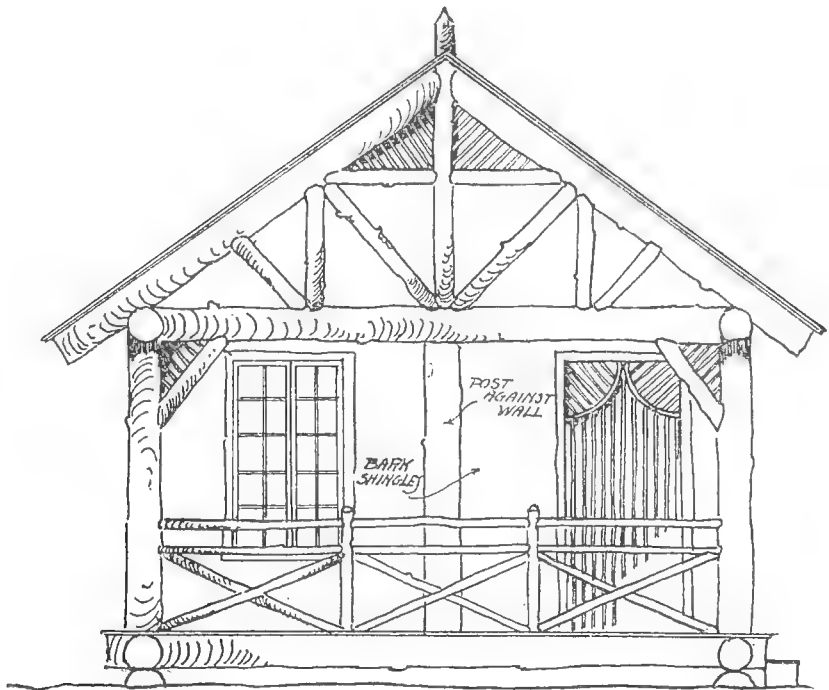

•PLAN•

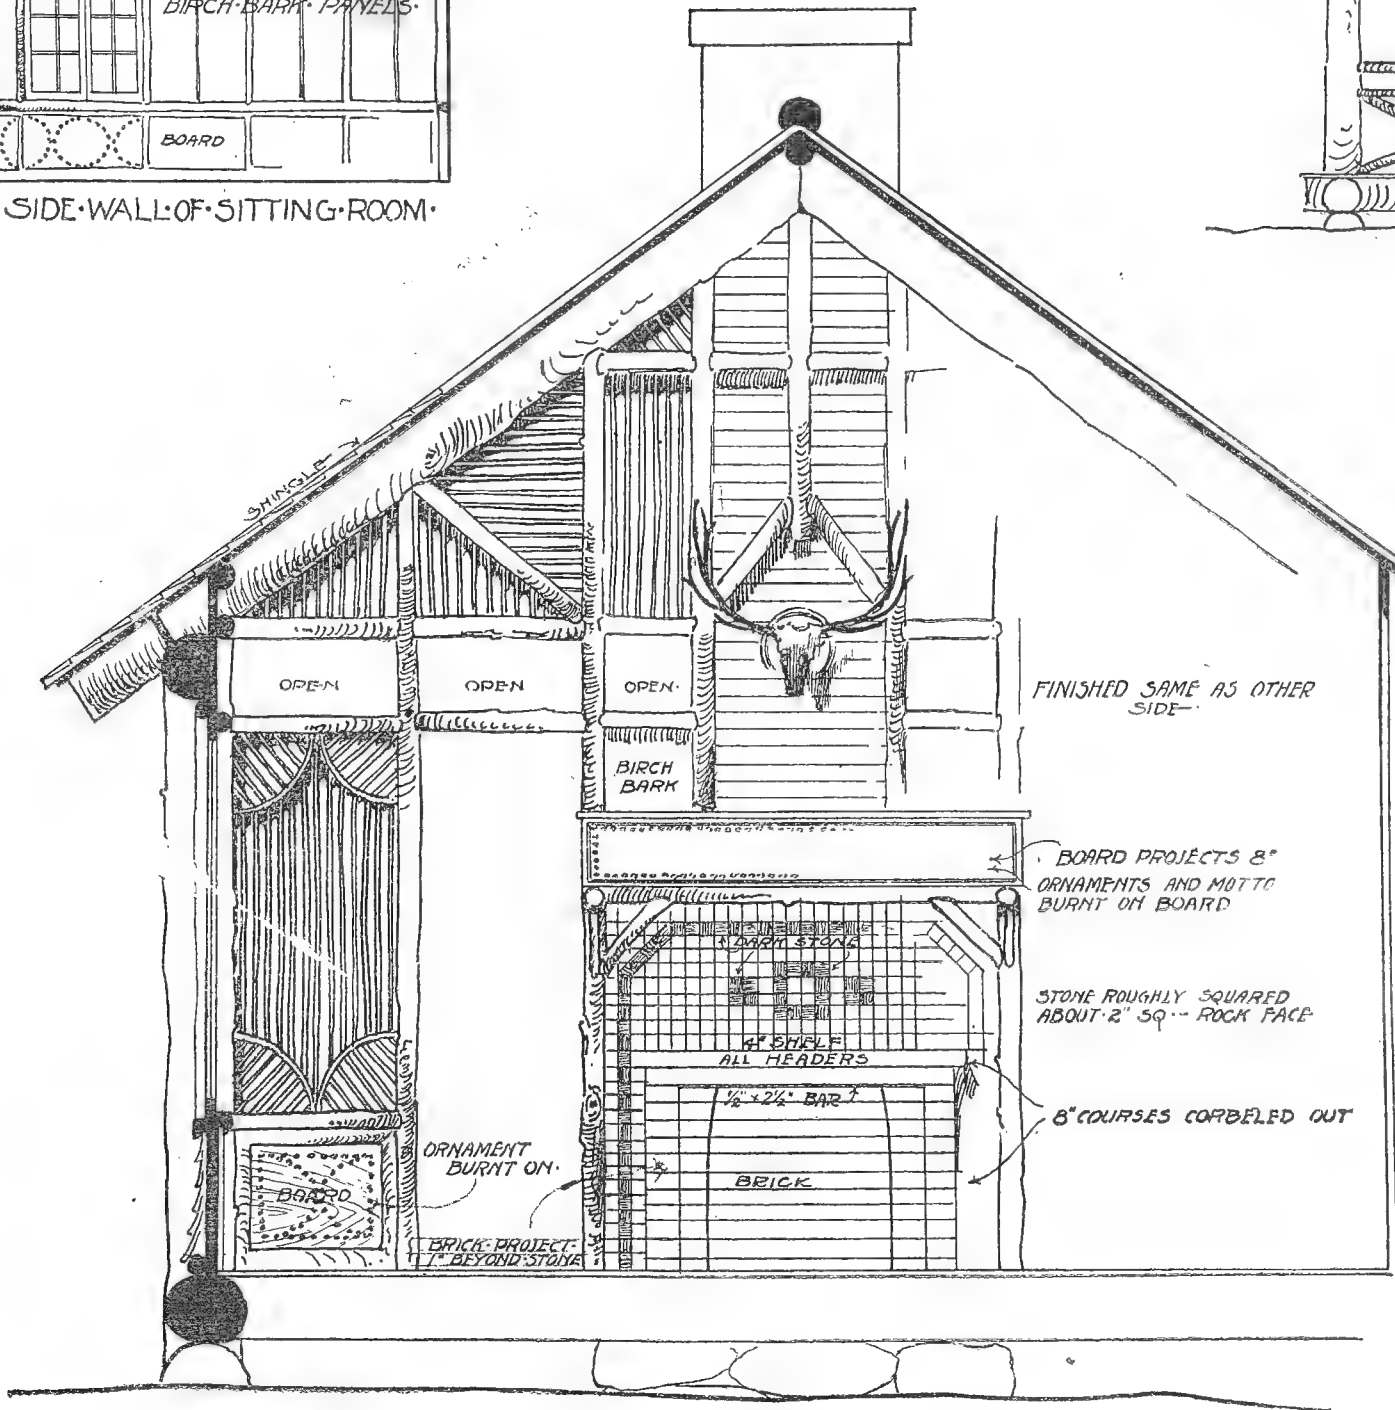

•SIDE ELEVATION•

•SIDE WALL OF SITTING ROOM•

•END ELEVATION•

•SECTION•

•SIDE OF MANTEL•

bark shingles taken from spruce trees. Shaved shingles, however, may take the place of the bark shingles, and are much more lasting. The bark, however, gives the camp a much more rustic appearance.

The rafters and floor timbers are made of small logs. the floor is laid of any 7/8 in. matched stuff. The roof boards are 7/8 in. thick and 4 in. wide, spaced to match the shingles, the shingles being laid 5 in. to the weather.

The window frames are fitted with a swinging variety of sash, hinged and held closed with hooks and staples, and open with a wooden bar.

The interior has the plank walls, covered with white birch bark, put on in panels, with rustic work over the joints. The base to the room is made of a wide inch board, with burnt or charred ornaments, made with a wood-burning instrument recently devised for this purpose. This ornament perhaps will be omitted by the usual woodsman.

The fireplace is made of common brick. If a stove is used it may be connected to the chimney above the fire opening. The rustic screen at each side of the fireplace, and the rustic work forming panels, make good work and amusement for rainy days.

The timber showing on the outside of the cabin, such as sills, posts, plates and porch work, is left with the bark on, while the rustic work on the interior is peeled.

The sleeping spaces back of the fireplace may be fitted with beds or bunks. In this case the bunks are made of small saplings placed lengthwise of the bunk and covered with layers of hemlock boughs, put on in such a manner that the butt ends come next to the saplings; thus they do not stick into the sleeper's back, but make a soft, springy bed.

Such a camp as this, well fitted out, will be found to contain a vast amount of comfort. The boughs on the bunks, a kit of tin dishes, cooking pans, etc., any

camper knows about—and the comforts too; they are many; no one appreciates them as does a lover of nature.

The material for such a camp need not cost more than \$75; the work probably \$125 more. The ideal way to construct such a lodge is for the campers to do it themselves; but if they are not so disposed a couple of carpenters will be able to put it together for the sum stated. The fireplace too may be laid up by the carpenters, although a mason might do it a little more quickly, and a trifle better. The camp illustrated was built entirely by the owners, and they report great sport in carrying out the work. The first season they built the sleeping cabin; the second season the dining and cooking cabin, and next season they are to construct a duplicate sleeping cabin. They state they never found so much interest before in any project undertaken.

WM. S. WICKS.

BUFFALO N. Y.

Sea and River Fishing.

Proprietors of fishing and hunting resorts will find it profitable to advertise them in **FOREST AND STREAM**.

Winter Fishing near New York City.

BY FRED MATHER.

WE were crossing Fulton Ferry to that part of New York City which for the past year has been officially known as "The Borough of Brooklyn," although before the consolidation it prided itself on being a city in its own right, the second in size in the State, and the fourth in the United States, with an area of some thirty-two square miles and a water front of nine miles. This is mentioned because there are thousands of "New Yorkers" who have heard of Brooklyn and know that across the East River there is a place of that name where people actually live, and a place where New Yorkers may have to be buried at some future time, for the great metropolis no longer permits interments on Manhattan Island. Perhaps some such somber thoughts were chasing each other under my scalp lock, or there might have been a speculation as to the length of time which the great bridge overhead would stand before the disintegrating forces which are present in the rocks and mountains, as well as the little works of man, find the weakest link in that great chain, and—

"Good evening, Colonel, been fishing lately?" And there was a break in all speculations as to the capacities of the great Brooklyn cemeteries, aided by the Fresh Pond crematory, and the possible life of the great "Brooklyn Bridge," as it is called. It took a moment to get from the realms of imagination to actual life on a ferryboat, just as one awakens from a dream and has to pull his wits together to fit into the new conditions. After a fraction of a second, of more or less duration, the questioner was recognized as an enthusiastic reader of **FOREST AND STREAM**, whose acquaintance I made when some years ago I offered my first vote in Brooklyn, when, as an "inspector," he took my name and wanted to know if I ever wrote for **FOREST AND STREAM**, and we were friends from that time. He lived on the same street in Brooklyn, and in that city neighbors are neighbors. When his card said, "P. C. Macevoy, 139 Linden street," and he told me that he had read "our paper" for years there was a bond of friendship formed at once.

The year had grown old and had but a few weeks of life left, as we met on the ferry, and I replied: "No; have not wet a line since August, when the trout season closed."

"Do you never fish for salt-water fish in the winter?"

"No; during the summer I take in a little bluefishing, either trolling or, better yet, chumming for them with rod and reel, and perhaps a day or two with the weakfish, or 'squeteague,' as they are known to the eastward; but tell me what fishing can be had now?"

Mr. Macevoy looked at the bridge for inspiration, then down at the Statue of Liberty for information, and slowly answered: "There is more good winter fishing for workingmen, like myself, who can't spend weeks in the wilds of the Adirondacks, or in Maine, about New York Harbor than can be found anywhere north of Cape Hatteras. Of course, you know that such summer visitors to our shores as the weakfish, porgy, sheepshead, and some others, go south before winter sets in, but we have other fishes which never appear in our bays and harbors until cold weather comes, and so there is good fishing near New York the year round, when the weather allows a fisherman to live on the bays."

"Now that you speak of it, I remember to have seen fishermen coming and going to the Long Island trains with short rods and that peculiar square hand-basket about 16 in. long, with a partition in the middle and covers hinged to the partition. The city salt-water angler may be known by this peculiar basket, which he often paints green. Is there any written or unwritten law which compels the salt-water angler to carry that particular form of basket, or to paint it green, if he uses paint upon it?"

Mr. Macevoy glanced at the ice in the ferry slip and at the deck-hand who came to attend to the gates, but seemed to find no inspiration in either. The question was in the nature of a conundrum. As we stepped ashore to take our different surface cars, for one reaches his home nearer than mine, he replied: "Perhaps it's a matter of fashion; I've never given thought to the subject before. I own such a basket, and it is painted green; no doubt it was a more or less following of a fashion. You know that there are fashions in costumes for bicycling, golf-playing and other sports; why not for fishing?"

Here was another conundrum; it was solved by saying: "What you say is true regarding costumes for various sports, but the salt-water angler has no distinctive costume; he merely carries a distinctive basket, and that's what worries me."

As Macevoy dodged off the ferry bridge I heard some disjointed remarks, broken by the roar of trucks and elevated trains, about trout-fishers wearing corduroy and carrying a creel suspended from a shoulder, and we parted.

Then came memories of tomcods taken along the docks and of the "flounder trains" which run up the Harlem Railroad every winter and carry hundreds of men up the East River and Long Island Sound every morning, especially on Sundays, when the workingman has his only chance to fish without loss of time. The fact that the codfish which seeks deep water in summer comes to our harbors in winter loomed up next, and it did seem as if an ardent angler who was not hopelessly addicted to fly-fishing might find a modified kind of sport near New York City in winter.

The fact that steamers went down to the "fishing banks," some miles outside of Sandy Hook, was well known, but nothing would tempt me to go on one of them because of a stomach which abhors the rolling of a ship and expresses that abhorrence in a painful manner. I had seen boys taking tomcods from the wharves on Long Island harbors and from the docks of New York City with clam bait, but never thought of com-

peting with them for the prizes, and as I had not engaged in flounder fishing before that very much compressed fish, whose name is a synonym for flatness, goes into its annual winter mud, I had given no thought to winter fishing, although I knew in a feeble way that some fishing was going on, without taking interest enough in it to investigate what it amounted to either for sport or food. Perhaps it was regarded merely as a way of getting food which to me was more easily got in Fulton Market.

All this was a year old and partly forgotten, or at least laid on memory's shelf for back numbers, where we rarely dust off the cobwebs and look on what is below, when in came Dr. Grover, young, handsome and fresh, not too fresh, but just fresh enough. Said he: "This will be a mild night for December, there is a gentle south wind, and a party of us propose to go to the iron pier at Coney Island and fish for codfish, and you will go with us."

"But, Doctor, I have no suitable tackle, hook, line nor sinker, not to mention bait, and am unprepared."

The Doctor merely said: "You have placed yourself in my hands for treatment, and I prescribe a moonlight trip to Coney's Isle to-night in my company, and all the ingredients of a codfishing outfit will be found at the pier. You may order your trolley car at 7 P. M."

What I don't like about doctors is their autocratic way of telling you what you must eat and drink, beside swallowing such drugs as it may suit their fancy to order you to swallow, whether you relish 'em or not; yet we have got into such a habit of obeying them that when my street car came to the door I stepped into it as meek as a lamb, without protest. There had been no order about chest protectors, heavy coats and "Arctic" overshoes, but they went with the outfit.

There was the Judge, a jolly young fellow about my age, with a fund of anecdote and a flavor of Madeira about him which was emphasized by one large shoe where the gout had pinched. The Senator was slim and disposed to argument, while the Merchant was jolly and laughed at everything, but ten minutes later could not tell what the joke was. That was the party—which the Judge, in a paraphrase of some old prayer, said when we ate our midnight lunch:

"Here's to us, the four of us,
Thank the Lord, there's no more of us."

The man at the pier was a kind soul; he furnished us with tackle for two hours' use and charged no more than Mills or Conroy would have done if we had bought it outright, and as for clams, he generously let us have them at the small price per clam that daylight dealers had the audacity to charge for a dozen, and we were happy.

A soft south wind and a rising moon, rippling waves sobbing against the piers and the lights of the ocean steamers coming and going, as well as the moonlight on the sails of coasting vessels to the westward of us, made a picture to be remembered. It was one of those beauty pictures which we of the woods and waters retain on memory's tintype after the years have fled. The plunks of the prosaic sinkers and the baiting of hook with the unpoetic clam are forgotten, but the memory of that beautiful night remains indelibly imprinted on the super-sensitive film of memory and will remain there while that memory is a living thing.

The tide was coming in, and the lines were all out. The stout Merchant pulled in and shouted: "I've got a fish!" He landed it on the pier, but, alas! it was a toadfish, known to the scientific duffers as *Batrachus tau*, and it flopped around regardless of the efforts of its lawful owner, the Merchant, to take his hardware from its mouth. In fact, it closed its jaws on his finger, causing him to say things which were utterly irrelevant, until we wondered what he was declaiming about.

The Senator moved that a resolution be adopted whereby all toadfish should be forbidden to bite the fingers of gentlemen who were fishing for codfish and were not in any way encouraging the attentions of toadfish or interfering with their business. This was carried unanimously.

The Doctor urged the amputation of the finger and the liberation of the fish, but finally yielded to my suggestion to amputate the fish and liberate the finger. A clamshell in the Doctor's hand opened the jaw of the fish and then the Merchant opened his. He said: "Meine freunde; we are hier gesebled dieses nacht to catch the codfish which is hier, aber nit, and only the needless toadfish comt hereon. I move dat de box of beer be obened."

Then the Senator landed a codfish of full 3 lbs. weight and declared that it had fought well. My line had been out without an intimation of a bite for nearly half an hour. Of course, the crabs had skinned it, but I was so interested in a story that the Judge was telling that I forgot the fishing.

Said he: Some winters ago I was fishing for tomcods off the pier at Far Rockaway, where few people go in winter, although crowds fish there for snappers, as young bluefish are called, in the fall, when I had a vigorous bite, and of course expected a big fish of the kind, for I knew that 2 lbs. was the limit of the tomcod; but you know how the heart of an angler increases its beats when he believes that he has a big fish on which may prove to be bigger than any of its kind that has been caught. I reeled in slowly, for the rod was bending to nearly its limit, although there was but little struggle at the end of the line. Everybody stopped fishing and gathered to see the prize or to give advice. Gradually the reel took in the line, until we saw a dark body near the surface—a moment more and a big boot full of mud—

"Ha! ha! Dot vas ein goot fish, Chudge; und vot dit you do mit dot poot?"

"Well," said the Judge, "I landed it fairly, and do you know I fished faithfully at that place for two weeks and never caught the mate to that boot, so I left it there, thinking it might be of use to some one-legged man."

As the tide began to turn, the fish were well on the feed, and we made some good catches of cod of 3 to 4 lbs. weight. It was past midnight when we neared home, and after leaving the cars the Merchant and I walked on together, and when we parted he remarked: "It's besser ven I haf elefen oder nine pounds codfish caught dan ven der Chudge ein olt boot hat gefangen. Wot you tink?"

"Yes, I think so too; good night."

District of Columbia Association.

From the Washington Evening Star, Feb. 7.

THE annual meeting of the Game and Fish Protective Association took place last evening in the officers' quarters at the Washington Light Infantry Armory, and was largely attended. Captain Robley D. Evans, president of the association, was in the chair.

After the regular routine had been disposed of the chair called for reports from committees. Game Warden Sylvester presented his annual report. He spoke of the good work accomplished in the past by the association, and referred to its excellent reputation. From a local standpoint, the said, the new fish law had been generally respected, and the game laws have been enforced, except where evidence has been carried in cold storage, which is not accessible under existing circumstances. He referred at length to the improved conditions in the fishing, which were largely due to the efforts of the association. He dealt with the efforts and success of the association in preventing the sale of game killed out of season. Warden Sylvester thought the association should inaugurate an interchange of information with the authorities of neighboring States, to the end of preventing the illegal shooting of game. He thought it inconsistent that the reed bird, the pest of the rice fields of the South, should receive such great protection, while the ducks were neglected. He said a policy of education by giving information had been pursued in securing respect for our game and fish laws. Protection of the game, he said, is as important to the dealer as it is to the hunter and consumer. If game must be had at all times the time will come when it will be exhausted.

Pollution of Potomac.

Chairman Henry Talbot, of the Committee on Pollution of the Potomac River, read an interesting paper covering recent investigations. Selfishness, he said, had polluted the rivers, and it is only by an appeal to selfishness that the harm may be remedied. When New Hampshire awoke to the fact that summer visitors to the State brought from \$5,000,000 to \$8,000,000, and each one wanted to catch at least one trout, the pollution was stopped, more stringent fish and game laws were enacted, and all over the State fish hatcheries were established.

"Where ignorance is bliss," Chairman Talbot said, "the polluter may well ask, 'what's the use of telling him?' The answer is easy. The use of a smallpox placard on an infected house. We go about our daily routine, and if somebody says 'typhoid' it is with rather a feeling of pride that we point to statistics to show that Washington is well up at the head of the list of cities in the United States in its cases of typhoid and kindred diseases. Only half a dozen towns are ahead of the capital city."

"And when our scientific experts trace the source of these diseases directly to the pollution of the Potomac, it is always asked, 'Why don't you filter?' It never seems to occur to any one to ask the more rational question, 'Why don't you stop polluting?' The poisons which do the greater hurt are organic, or result from their decomposition. These wastes, whether of the field or domestic establishments, pulp mill or tannery, are all not only valuable, but indispensable for the renewal of exhausted soils, and their waste alone is in the nature of the crime of prodigality, without taking into account the trespass, indeed the outrage, upon the rights of those upon whom they turn this refuse."

"This might be dried, drowned and filtered, buried, burned or scattered on the fields, and be harmless. Thrown in the water the sin is hidden, but it is a threat against the health and lives of thousands of fellow citizens, to say nothing of the fish."

He said the year had shown progress everywhere in the matter of pollution. It was of interest to the association to know that the big pulp mill at Cumberland would shortly be removed.

The Incomparable Potomac.

"There is no stream in the world to compare with the Potomac as a home for bass," he said. "With romantic scenery, surpassed by none for beauty, a climate exactly suited to this noblest of game fish, a volume of water that assures him against extermination, out of reach of the lamprey or other enemy, save man. Keep but his habitat pure and supply him with food, and anglers will come from every direction to cast a line for Potomac bass, which, with Potomac shad, will stand always for the best."

"The amount of money expended by anglers is usually underestimated, but a little inquiry among our own members demonstrates the fact that for those who love the sport few spend less than \$50 a year, and from that to \$300, to fish nowhere save in the Potomac."

"Make the river what it should be, and revenue from a few pulp mills to the residents will be a trifle to the moneys which wandering anglers will scatter up and down its banks."

Mr. Talbot devoted some time to a discussion of the bills pending in Congress relative to filtration. If filtration is to be the remedy, he argued that it would be well to provide at public expense a filter for every community and every hamlet along its banks below the sources of danger.

Chairman Hunter's Report.

Mr. Joseph H. Hunter, chairman of the Committee on Fish, presented a verbal report. He rehearsed what the association did last year in seining the canal, and pointed out the excellent fishing which prevailed up the river last spring. It was his opinion the seining of the canal yearly did a great amount of good. This year, because of lack of funds, seining was omitted. He hoped next year it would not be. In reply to a question, he said it cost in the neighborhood of \$300 to do the work.

Dr. Theodore S. Palmer, Assistant Chief of the Biological Survey, Department of Agriculture, upon invitation, delivered an address. He took for his theme wild ducks, and spoke at length of the merciless slaughter that was going on, which was rapidly exterminating them. There were sixty-two species of wildfowl, he said, forty-one of which were wild ducks, sixteen geese and five swan. Thirty-one of these were to be found in the waters of the District, twenty-seven being wild ducks, three geese and

one swan. He exhibited maps showing the closed and open seasons for game in the different States. The danger to ducks is that the laws only protect them in those States where they breed. Our open season in the District, he said, is too long. The markets here are open to the gunners of other States when the law in those States is up and the season closed. The spring shooting about Washington, at least, should be curtailed.

The secretary and treasurer having referred to the depleted condition of the treasury, a motion was made after the regular reports had been read to increase the dues. Such a motion had been made at a previous meeting, and came up as unfinished business. There was not a dissenting vote against the motion, and the dues of the association hereafter will be \$2 per annum. The wish was expressed during the discussion that every member of the association promptly remit his dues. There is considerable work on hand and funds are needed.

The nominating committee presented the nominations for the officers of the association during the year, and, having been presented, these were voted upon, with the following result:

Robley D. Evans, President; James F. Hood, Vice-President; Dr. W. P. Young, Secretary-Treasurer, and Richard Sylvester, Warden, together with an Executive Committee consisting of Walter S. Harban, Chairman; Frank B. Curtis, Jas. M. Green, Joseph H. Hunter, Charles H. Laird, Harrison Dingman, Jesse Middleton, Frederick B. McGuire, Rudolph Kauffmann, George L. Nicholson, Isaac W. Sharpe, Henry Talbot, Gabriel Edmonston, Dr. Charles H. Miller and Col. Wright Rives.

CHICAGO AND THE WEST

Japanese Fly-Fishing.

CHICAGO, Ill., Feb. 2.—In the issue of *FOREST AND STREAM* for May 24, 1898, I printed what I have always thought the most interesting piece of sporting news I ever came across in my work for the *FOREST AND STREAM*. This was a description of the unique fly-fishing method practiced by a Chicago man by the name of Edward Taylor, with whom I fished on the Prairie River of Wisconsin. This method was so utterly at variance with all the centuries-old canons of fly-fishing, albeit so extremely successful, that it seemed like absolute heresy to offer it. Perhaps some of the readers of the paper considered the matter sensational or unauthentic. It was neither, but far inside the facts. Rather to my surprise, the story was passed by without much comment, possibly because readers did not like to change so suddenly their cherished traditions on fly-fishing. The method mentioned was not the old doctrine of "long and light," but the absurd one of "short and heavy" fishing with the fly. By this means Mr. Taylor always takes more large fish than the best practitioners of the old ways of fishing, as I was well satisfied to say after what I saw of his work. A few persons since then have written me asking for fuller information about the matter, which I have tried to give from time to time, as I thought the matter a most curious discovery.

The *FOREST AND STREAM* story, oddly enough, found its most interested readers far to the west of here, across the Pacific Ocean in the Land of the Chrysanthemum, as perhaps I indicated in my mention last week of the visit of Mr. J. O. Averill, an American gentleman living at Yokohama, Japan, and now in this country on a visit. At the time of his call at this office, Mr. Averill (I trust he will forgive me for making known his name openly in this way; I do it for sake of the *FOREST AND STREAM* readers, who will want to know him) promised to write me an account of the Japanese way of fishing, which he found very similar to that which he had seen described in the story in *FOREST AND STREAM* last May. True to his word, Mr. Averill has been so kind as to do this, and I shall offer below, with his permission, the text of what I consider one of the most remarkable communications on novel sporting methods that it has ever been my fortune to see. I am sure that the *FOREST AND STREAM* family will see, this time, that the news from Wisconsin was authentic and accurate, as well as singular, and I know they will be surprised and delighted as much as I am myself at noting this curious and interesting confirmation which comes for it all the way from the far-off Island of Japan. The theory which Mr. Averill advances as to the appearance of the insect while in motion is one so simple and probable that it is odd that no one has ever yet advanced it, yet no one seems to have reflected that the wings of an insect while in motion do not look like a stationary chip or block, but like a filmy and indefinite haze, similar to the effect created by the blades of an electric fan. I have said that Mr. Taylor always cut off more than two-thirds the hackle from his fly. The Japanese fisher is yet bolder and yet nearer to the truth in his methods. The fly which Mr. Averill sends me is of very thin hackle, the beards standing out all around the shank, and not up and down stiffly as our American fly-tyers make them. The hook itself is very odd, bent down at the curve at almost a right angle, and coming up with the effect of an angular, center-draught sproat, as though some ignorant artisan had tried to imitate the sproat. Yet the Japanese angler was not clumsy or ignorant. He knew his wishes, and his hook artistically fills them. Mr. Averill in his personal letters says, "The hook is a terror for this snatching or 'snagging.' It seems to dart right into the fish as the quick little Jap snaps at him as he rises. It is quick, sharp work with these wary trout, for they do not suck the fly in, and give you a show, but just make a snap and are off."

But I am constrained to pause in the pleasant task of comment on these matters, and submit Mr. Averill's fine communication in full, it being too good for a word to be lost. He deserves, and will have, the thanks of many anglers for his news letter from the Occident, though I fear he leaves some of our old notions on fly-fishing a bit disfigured. He writes as below:

New York, Jan. 23.—I have for some time wished to write you in regard to your new or "Taylor-made" method of fly-fishing for trout. Business and other "chains" have, however, delayed me until this time. First, I want to say that I think you have given the public the first intimation of a very important point in fly-fishing. I know what a conservative party the fly-fishers are in many ways; but I am surprised at the small interest apparently manifested in the method you have

brought to light. Perhaps my own feeling as to its importance is caused by the fact that the Taylor method is, as nearly as I can make it out, a perfect confirmation of and agreement with the ancient and general Japanese mode of fly-fishing. The Japanese are old hands at the art of fly-fishing, and as those who know them are aware, very deft and skillful in the use of their hands. They have no close seasons; most of their streams are therefore fished practically every day in the year by men who depend for their livelihood largely on their catch with the fly.

Many, if not most, of their trout streams are as clear as crystal; and this, in connection with the constant education of their trout by uninterrupted fishing, make their fish extremely shy and wary; and should be almost enough to prove that whatever method they successfully employ under the difficult conditions existing is a good and worthy method.

Now I shall proceed to try to describe their method, and in doing so shall doubtless ramble and be rather lengthy, so prepare yourself and use your discretion as to cutting and curtailing.

I shall begin by saying that three of us—all old residents of Japan—finding feathered game greatly reduced by its constant pursuit in the small radius of twenty-five miles in which we foreigners are allowed the use of the gun near the "treaty ports," were led to go in for trout fishing.

We had often, in the country districts, eaten trout in Japan; had occasionally seen a Japanese fisher take one; but had been led to believe that they could not often be caught on the artificial fly. Many fishermen, some English and some American, of varying degrees of skill, had tried in their own way to catch trout with the fly; but reported, almost to a man, that it could not be done; and that the Japanese depended on nets for their main supply. Not deterred by these reports, we began a careful investigation and found that, while netting and trapping are, I am sorry to say, much used, still a very large part of the catch was made by the artificial fly. Thus encouraged, we ventured on a trial. By some traveling we discovered a stream which, after a rain, grew quite discolored and offered conditions apparently favorable to taking trout in the regular method as practiced in England and America.

One of our trio is an Englishman and a very fair fly-fisher, having fished with good results, as compared to those fishing at the same time as himself, in the streams of England, Scotland and Wales. He soon began, in discolored water after rain, to take a few fish in the regular wet-fly style of fishing. But to his surprise, and on occasion after occasion, he found that after he had "whipped a pool" in the most approved style without result, his Japanese attendant would step on the same rock he had left and take, in the Japanese style, several good fish from the water he had gone over. This occurred not once, but always. The unvarying result of this competition of varying methods led me, who am a novice at fly-fishing, to suspend my practice at the regular method, and holding myself open to conviction, to study and practice the Japanese style. I followed and carefully watched the Japanese fishermen; and shall try to give you, from my observation and carefully made notes, a description and I hope an explanation of their method.

First as to tackle: The Japanese fisher selects from a grove of growing bamboo a dry shoot of the straightest and lightest growth, trims the leaves and gets a rod of about 10 to 13 ft. with a top tapering to the fineness of a small cord, and just as impossible to break at the end by bending as it would be to break a fishing line by simply bending it. This rod is fitted to a lower joint of bamboo about 6 to 8 ft. long, chosen so that the upper joint fits snugly into the hollow end of the lower piece. This gives a rod of say 16 to 18 ft., weighing about 7 to 9 oz. The rod is stiff to within a short distance of the top, where it is as pliable as a light whip. To the upper end of the rod is attached a light line, usually of about three horsehairs, or an equal thickness of silk, some 12 to 15 ft. long; to this is tied the thinnest of gut leaders about 5 ft. long; and to this a fastened the single fly. Both gut and line are light and delicate. The flies are always plain hackles, and only two shades are used, grayish yellow and reddish brown. The bodies vary greatly, and at the individual caprice of the tyer, who is expert at fly-tying, and can usually sit by the brookside and tie a fly in a very few minutes.

The Japanese fly has very few bristles or hackles, and these are tied to stand perpendicularly to the shank of the hook, not drooping as ours do. The appearance of the Japanese fly is something as here shown as compared to ours.

The method of casting is to stand at the brookside or in the brook, and cast up and across directly at the hole, rock or ripple where the fisher, who knows every likely lurking spot, thinks the trout is lying. The cast is made by a quick, strong motion of the wrist and forearm, the rod not going back beyond the perpendicular and sharply brought down and forward to almost the horizontal; a slight twist of the wrist prevents snapping the fly off. This cast shoots the line, with the fly at the end, straight out across the water. As the fly drops the tip is slightly raised so that the fly, and the fly alone, alights on the stream literally as quietly as the often talked of "thistle-down." At once the fly touches the water the tip of the rod is agitated quickly, but slightly and gradually elevated, the fly making a series of little jumps and struggles, so lifelike as often to be taken by the onlooker for a live insect. Only a few feet of water are covered and then the fly is quickly picked off with another cast to nearly the same spot. The fly is never allowed to sink under water, but is kept on the surface and in almost constant motion. The cast is repeated again and again at well-known or likely places, and seems to me to resemble closely Mr. Taylor's "teasing," as described by you.

It is difficult to describe in words the operation of the fly, and probably only an actual witnessing of it can fully convey the true style and the lifelike look of the struggling insect. Its leaps are very short, and it probably never moves above an inch at a time, and usually much less. This slight struggling motion is difficult if not impossible to convey to the fly with our rods, owing to their "whipiness" and pliability, extending, as it does, from tip to butt. The length of our trout rod also prevents the cast extending above 20 to 25 ft., as the rod

must be lifted so that no line is in the water; but with the Japanese tools a cast of 30 to about 40 ft. can be successfully made.

This roughly outlines the method. It cannot be mastered at the first effort, but requires much practice and patience, as all good methods do.

I may say that after watching the successful Japanese fishers and then faithfully practicing, I have arrived at a degree of skill which (while far short, as is natural, of the long-practiced and really professional Japanese fishers) enables me to catch not only more fish, but larger fish than my friend who used the wet-fly method.

Careful study and comparison of results have now led all of us to adopt the Japanese method, at least for the clear water and middle hours of the fishing day.

We have noticed that the Japanese fly-fisher takes most of his fish between the hours of 9 and 4:30, and he almost invariably rolls up his line as it grows dusk. This seems to agree with the dry-fly fishing, which is reported as successful, largely, if not entirely, in the "middle hours."

I think the Japanese method is superior even to the dry-fly style, and for the following reasons: On a bright day in clear water even a single link of the finest gut floating and turning in the moving stream is clearly visible to the fisherman's skilled eye, and its shadow on the white sand of the brook's bottom often resembles the size and contortions of a sea serpent. It seems probable the trout's eye is at least as sharp and quick as the human eye. The line and gut must usually pass over the feeding fish in dry-fly-casting, while in the Japanese style the fly only touches the water and the line and gut are often (always when possible) pointing in a straight line from the fish into the air, and visible practically only in cross section and behind the fly; while the shadow of the line in the air is infinitely less than lying upon the surface surrounded by globules of the water, which increase the size of shadow.

As to the wet or drowned fly method, I can only say that in the clear water in which we fish the few fingerlings which, among the wary inhabitants of these constantly fished waters, are found to take the wet fly are too small and too few to make it worth practicing. As yet the smallest English midges on the finest of dry-fly gut have failed to deceive the feeding fish in our clear water. They pick out the invisible (to us) floating gnat within an inch of our flies, but except for a very occasional impressive fingerling, leave our daintiest lures severely alone. Still, we feel that in water a bit discolored and late in the day there may be chances for the wet or dry fly; but when we can, by what seems to us the most skillful and delicate of work in the clearest weather and water, take the largest fish the stream produces by our other methods even in really skillful hands fail, we Japanese method, while, when tried at the same time, all feel we have a method at least worthy of careful thought and practice.

I could give instances without number of trials of the methods side by side. One of the most marked was witnessed by our party of three. Our English friend carefully whipped a fine pool without a rise. After he finished I, who am as yet but a duffer, stepped to the bank, cast some dozen times over the best part of the pool, rose, struck and landed the largest trout we have yet caught in our stream. This is but one of numerous cases, and is mentioned, I suppose, largely from vanity—still it helps to support my arguments for the new method.

Now having sketched the method, I must go into some theoretical considerations.

First as to flies: I was surprised and delighted to find an old favorite, the "brown hackle," also the favorite of the Japanese. (By the way, I remember good old Cotton says when you are in doubt as to what fly to use, to fish with a dun hackle until you catch a trout, then cut him open, see what flies he has been eating and tie accordingly. Why not continue to use the good hackle to catch other trout?) But I digress. I only wish to show what all know, the standard and long known killing qualities of the hackle.

Thinking of this almost universal fly and watching the Japanese use it in their lifelike way, I was led to compare its looks with the natural insect while flying; and I think if anyone will look at a lightly feathered hackle and then at the appearance of an ordinary river fly in motion, the great similarity will be apparent. A fly while flying does not look to me like Fig. 1, but like Fig. 2; the wings do not appear as clear outlines, but as a gauzy haze on all sides of the body.

I should much like to see a photograph of an insect in rapid flight, or with wings in rapid motion, and one of a well made hackle, tied as I have indicated the Japanese tie their flies. I hope some time to make these photos. This theory of the fly in motion is my own, and I have never heard or seen it. The Japanese do not seem to know of it; but both they and their foreign fellow fishers use the hackle.

I submit this theory for consideration. If the theory of the flying insect is correct, it is easy to see why the two shades (yellowish gray and reddish brown) will practically cover about all insects likely to be taken by trout. Watch the river insects while flying, and the gauzy halo of their buzzing wings will almost always fall into the two shades mentioned. (A most interesting article on the color sense in trout's eyes in the *London Field* occurs to me here, but is too lengthy to go into.) If this wing theory is correct the bodies only need change to represent about all the needful flies. The Japanese fish the year round with these two shades, for what I claim as the wing effect of the insect in flight, and their method evidently represents the fly alive and struggling to get off the water, using his wings to the utmost.

The theory that the hackle represents the buzzing wings of an insect may be held to be true only while the insect is on the surface or above it; but who can say that the trout can tell, from his position, just where water ends and air begins; and may he not misjudge a bit or take even the submerged hackle for a buzzing, winged insect? I find one can theorize endlessly on this subject, and if anyone knows positively about such things, I trust to be enlightened.

Please do not think I attempt to make light of the success of either wet or dry-fly methods. The drowned insect in a faint light, in discolored water, or to the voracious trout of a wild or little fished stream, is no doubt an

attractive lure, while the beautiful English imitations of flies (some with their fish-scale wings, so real as to be practically indistinguishable from the true article) must, if dissociated from a line and gut, deceive any trout; still I think this new method, or rather this old one, is worthy of careful consideration.

Numerous points in favor of the Japanese method suggest themselves to me.

The absence of disturbance in the water by gut or line seems a very important thing, at least we know it is in our crystal streams.

The struggling motion of the fly seems as if it must tease a trout which is supposed to be a bit "touchy" and combative. Mr. Taylor thinks he "teases them out"; and I have seen a Japanese fisher tease out a fish which I believe to be one he had actually touched at an early cast, and after a dozen more casts finally land him. In watching an expert Japanese I have been almost irresistibly tempted to seize a stone and kill the teasing struggling fly. I have had frequent experience of fish coming out after dozens of casts had been made in the same spot.

I find that I have not mentioned that important point, the strike. This, in the Japanese style, is sharp and very quick; but what I wish to claim is that the line being always taut enables the strike to be given most quickly, while the motion being down stream and the rod invariably below the fish puts the fisher in the best position to hit a fish rising, as I think they do, from down stream up at the fly, which is losing ground at about the speed of the current. This is a point which the fisher in this style must carefully practice, viz.: to have his fly always going down stream, or but slightly across, and not to have its speed much if any above that of the current. It must struggle to escape, but continue to be swept down stream.

I wish also to submit a few theories and guesses at concealment in fishing. I have seen, and doubtless all anglers have, a wary trout dart frightened from a pool even when approached from behind a huge rock, and with the sun directly in front of the fisher, so that almost no shadow could touch the pool even from the extended rod. In such a position I have had a startled trout dart to within a few inches of my feet at the first slight movement of my rod in the air, showing that he observed the least motion, but was unaware of the direction of the maker; on the contrary I have, within a few minutes, taken three fair fish in succession from a rock in mid-stream, on each occasion floundering across the stream to the shore to land my fish and having my shadow as well as that of my rod go right across the pool.

These things seem rather contradictory, but I have a theory which brings them somewhat nearer to agreement than at first seems likely.

I have noticed, by experimenting on gold fish in a globe, that the first sudden motion alarms the fish greatly and they dart quickly about; the next motion of the same kind alarms fewer fish, and finally, if the same motion is kept up, the fish gradually cease to notice it at all; lying quiet. Now if the motion be changed, say from a quick movement of the hand to a sharp tap on the globe, the same process is again gone through with. I have tried this trout in a pool. On a hot, still day, with the water like glass, I have carefully worked my way close above a fine pool, in the "still deeps" of which were lying some twenty or thirty trout of all sizes. The first cast startled every fish, and a few of the very largest left the pool. The next cast alarmed the fish less, and finally all ceased to move as my fly lit on the surface. It was a hot, still day, with not a fish feeding, all lying in the deeps; the water below me was as clear as air. I stood perfectly still in plain view of the fish, which I could see perfectly clearly, and kept on casting; finally a fingerling grew interested in my fly, followed it once or twice and at last made a shy snap at it.

I detail this at such length because I think it bears on the subject of concealment and "teasing." While perfect concealment is undoubtedly the best of all modes to throw the wary trout off his guard, he is so very quick and cunning that it is very difficult to get into a position of complete concealment.

Now, while I have little doubt as to the teasing nature of a bold trout, I think that, aside from his combativeness, he gets used to a frequently repeated movement of a not too violent nature, and that a fisher standing perfectly still (of course, taking all possible pains as to sun and shadows, background, etc.), can by a series of casts made with as little motion of the arm and rod as possible, and each movement as nearly as possible alike, accustom a trout to the movement—interest him in it, and if his fly is well worked and has a lively natural look, at last tempt him out.

Probably the largest and most knowing fish often run away, but I have several times found they only sank well out of sight under some cavernous rock and were at last tempted out to take the fly within 15 to 25 ft. of the fisherman.

I have spun out a length of yarn which will, I fear, exceed even your ideas when you told me to write you at length, but you know the enthusiasm of a brother of the angle, and will be lenient, or cut as you see fit.

I wish the season of my short stay in this country was such as would permit me to have a day with you on our home waters, where we could practice a bit together, and give me a chance to test our "snagging," as we call it, be-

side your skillful work in the orthodox mode; but that day must be postponed for a while. It shall come though one of these days.

I must add in closing that while using the Japanese method of casting, their length of rod, line and leader, with the single fly, I have put line guides and reel seat on my long Japanese rod, and thus take the advantage of the many delights and benefits of using the reel as in the usual method of fishing.

I feel that I have imperfectly explained this method and should be glad to answer any questions which may occur to you on reading my letter, to the best of my, as yet, rather imperfect knowledge; but I must say that my success, the great similarity between the Japanese and the Taylor style, together with the unvarying good results observed in the practice of these modes of fishing, give me great confidence that the method which I should like to call "snagging" (in imitation of a devoted brother of the angle and dear friend) has points worthy of the best thought of our thoughtful fraternity.

J. O. AVERILL.

Asks for Trout Waters.

Mr. J. F. Stickel, of Helena, Mont., writes me the following letter about Michigan and Wisconsin trout waters, and the proper flies to use in that district:

"I am not a regular subscriber of FOREST AND STREAM, but I buy it nearly every week at a newstand here, and greatly enjoy your department. I return to Chicago in March, and it is my plan to spend several weeks next season on some good trout water in Wisconsin or Michigan. Will you please advise me of the names of any good trout streams you may know of in the territory named, together with dates as to best fishing them, that is, are they early or late streams?"

"I have never caught a trout in Wisconsin, and am making up my fly order by Mrs. Marbury's 'Favorite Flies.' Will these carry me through: plain, leadwing and royal coachman, professor, grizzly king, Seth Green, black gnat, yellow May, red, black, brown, yellow and gray hackles, cowdung, Montreal, with a few silver Dr., R. Ibis, W. Miller, March brown on the side. If you know of any certain fly which is especially taking on particular streams would consider myself greatly indebted to you for such information."

I do not blame Mr. Stickel for enjoying my department. It is an awfully good thing! He ought to read FOREST AND STREAM not part of the time, but all of the time, and then he would not need to ask me where to go fishing. If he will go to Baldwin, Michigan south peninsula, any time in June, he will be near any one of a half-dozen good trout streams, to which he can get local direction. Later in the season is better for the rainbow trout in that district. He may take fish up to 3 or 4 lbs., rainbow trout. I presume, however, that the Au Sable River, reached at Grayling, Mich., is the best trout stream of the State. This is the once famous grayling water. It is now becoming almost equally famous as a stream for rainbow trout. I presume Mr. Stickel could not do better than to visit it.

As to Wisconsin, I would recommend the Prairie River, via Merrill, Wis., late May or early June. For flies on the Prairie River I would advise Seth Green, coachman, cowdung, brown hackle. For Michigan the same selection would do, and I should add professor, queen of the waters, and leave out the Seth Green. All the other flies are nice, but with those I have named I would not be afraid to go out either in Michigan or Wisconsin. I would not wish, however, to be drowned in a trout stream with a red ibis or a silver doctor fly fastened in my hat.

Mr. D. G. Henry, of Grand Rapids, Mich., deputy warden and president of the Game Fish and Dog Protective Association, writes me an interesting letter, which I beg leave to quote in full. I have not yet received the old fish net which he mentions, but expect soon to add it to my other trophies, and shall value it very much. Mr. Henry's schedule of weights and measurements of brook trout is something very well worth cutting out and pasting in the fly book. He writes as follows:

"I send you to-day the fish net I promised you. This net was taken with some others out of the Pere Marquette Lake in December last by myself, and the fishermen arrested and served thirty days each in jail—two of them. This net is hand-made, as you can see, and was used by a class of men that give the department more trouble than any other of our northern fishermen. They think we are oppressing them. They serve their term in jail, make more nets and go at it again. They are learning slowly to obey the laws of the State."

"I also send you a scale of lengths and weights of brook trout, as compiled by me. I based my conclusion on weighing several fish taken from different waters, such fish of the same length, and then striking an average. They don't vary as much as one would suppose, and I find them a great deal more uniform in weight than I had supposed before I commenced the test. This scale is for the square-tailed brook trout taken from the northern waters of Michigan, and this is about as near as I can get to the weights of the different lengths of trout:

Length.	Weight.
7in.....	2½oz.
8in.....	4 oz.
9in.....	5 oz.
10in.....	7 oz.
11in.....	9 oz.
12in.....	11 oz.
13in.....	14 oz.
14in.....	16 oz.
15in.....	20 oz.
16in.....	24 oz.

E. HOUGH.

Maine Legislation.

BOSTON, Feb. 13.—Generally the attempts at special legislation on fish and game matters in Maine are quietly being given the cold shoulder by the Committee on Fisheries and Game at Augusta. Several petitions for special privileges to take fish from certain lakes and ponds in winter time have been quietly put on the list marked "leave to withdraw." It seems that a sensible committee has the initiatory features in charge there this winter. Commissioner Carleton still believes that the \$6 September special license deer shooting measure will be

tacked on to the bill the commission is to propose, but it comes from pretty reliable sources that the measure will meet with extreme opposition. The measure to prevent hunting partridges with dogs at all times was killed before the committee last week. The proposition of certain farmers to be permitted to kill partridges in close season, when found budding on their apple trees, never got further than a ridiculously small petition sent timidly to Augusta by a member who doubtless never presented it. A gentleman just from Augusta tells me that the proposition to reimburse certain backwoods farmers for damage to crops by deer is likely to be laughed down before it gets through the committee room.

SPECIAL.

Hints for 1899 Trouting.

EDMUNDSTON, N. B., Feb. 3.—*Editor Forest and Stream:* Many inquiries are made of me as to the trout fishing in this vicinity, and probably there are many of your readers who would like to know of a good place to come for an outing, where good sport can be had in trouting, where health reigns, scenery is grand, with bright, clear, cool water, lakes, rivers and streams filled with trout.

I will just briefly describe one of the many routes that can be taken by the tourist.

Fourteen miles up the Madawaska River, with a carry of four miles over a good wood-road, Beardsley Pond is reached. Running down the outlet, which is a small brook, just large enough for canoeing, half a day is needed to reach the main stream (which is a beauty); down this two miles Squatook Lake is reached. This lake is nine miles long, three-quarters of a mile wide. Parties if so minded can stay all summer here and have good sport every day. The outlet of this lake is fourteen miles to the west. In places on this river the water runs quick, making a ride very exciting to the novice. In the spring months there is very fine fishing all the way. A log jam bars the river, where a carry of 100 yds. is made.

Sugar Loaf is now the lake we enter, so named from a mountain of this shape which overhangs the lake, and from the top of which a fine view is obtained, well worth the labor of the climb. The lake is three miles long by a half mile in width. A week or more can be very pleasantly passed here.

One mile of river and a lake of four miles is passed, with trout all along; one mile of river and a large stream enters from the right. If we go up this half a mile this stream forks; the left is Eagle. Half a day's poling to Eagle Lake, three miles long, half wide. There is only one place on this lake where trout can be taken.

Horton Lake, on the right fork, is more difficult of getting to. It takes three days of hard work to reach the desired spot, but there is the best of fishing all the way, and the lake is filled with large trout. This lake is almost new to the sportsmen. There is not a party once in five years to visit this great trout lake.

But we will start from the main forks down a large, easy-flowing river, the scene constantly changing as we wind round the many crooked turns of the nine miles of its length. At the mouths of brooks trout can be taken. Tuladi Lakes, ten miles, do not amount to much as fishing lakes, but with a guide who knows where brooks are plenty of trout and good fishing may be had. I was here with a gentleman from New Haven a few years ago. At the mouth of a breakwater about 3 ft. we saw hundreds of monster trout. We thought there were enough to load a car. Some of them looked to be 3 ft. long. Tuladi River, the outlet of these lakes, is a rapid piece of water of four miles, and all through the month of June there is good fishing.

Lake Temiscouata, the basin of all these waters, which here empties about midway of the lake, is thirty miles long by one and a half wide. I have been with parties thirty days at a time and had excellent sport every day. Mr. Joseph B. Townsend, a lawyer of note from Philadelphia, took this lake for his recreation for six annual trips of from twenty to thirty days each, never leaving it nor desiring any better water for sport than he found here; and he knew what good fishing was, as when he first came here it was his thirty-eighth annual fishing trip. He pronounced the fishing better than the Moosehead or Rangeley, even in their palmiest days.

Down the lake we go, taking fish all the way, to the mouth of the River Madawaska, down which it is eight miles to our starting point. This makes nearly one hundred miles, all down stream, through nature's wilderness.

There are many lakes in this country quite easy of access where the artificial fly has yet to be cast for the first time. I expect to see many new faces here this season, and hope they will not all be like the most excellent gentleman previously mentioned. When he was praising up our fishing I asked him if he would tell his friends about it when he got home. "Ah, no; when I find a good place like this it's a secret. No one knows it from me. Let them find out for themselves."

S. J. RAYMOND.

Frogs and Friendship in New Jersey.

PATERSON, N. J., Feb. 7.—*Editor Forest and Stream:* I noticed a libel on New Jersey in your last issue, and hasten to correct it. Mr. Mather, on the authority of somebody in Plainfield, declares that there is no such place as Friendship in New Jersey. I know of two such places, one in Burlington county and the other in Cumberland county, the latter not far from Bridgeton. As to the raising of frogs there for the market, I had heard of such a thing, and when I saw Mr. Mather's insinuation that we have neither Friendship nor frogs in New Jersey, I wrote to Warden Harry R. Dare, of Bridgeton, for information. I have just received the following reply:

"I reply to your letter of the 2d, I would say in regard to the frog pond that instead of at Friendship it is nearer Carmel, but in the same township. I have seen the pond many times, and understand that the owners have sold between \$500 and \$600 worth of frogs from it. We have a number of smaller ponds in this vicinity, where they are experimenting with frogs. The ponds are enclosed with fine wire at present, as the frogs are buried. I shall let you know later on of the success."

CHAS. A. SHRINER.

New York Fish Commission.

The fourth annual report of the Commissioners of Fisheries, Game and Forests has just been issued in preliminary form. From it we take the following:

Superintendent of State Hatcheries James F. Annin reports:

The work for the year closing Sept. 30 has been highly satisfactory, and in importance and value exceeds that of any previous year. The new hatchery at Constantia, on Oneida Lake, in Oswego county, was completed, equipped and all ready for work April 1. The commission named it the Oneida Hatchery. A special appropriation of \$6,000 for acquiring a suitable site, building and equipping of a fresh-water fish food hatchery, was passed by the Legislature of 1897. The work was finished within the amount of the appropriation, and it is a first-class hatchery in every respect. Pike-perch, yellow perch, ciscoes and whitefish are among the fish that will be hatched there the first year. The pike and the perch are hatched in the spring, ciscoes and whitefish in the fall and winter.

The hatchery has the capacity for handling 125,000,000 eggs of the spring-spawning fish, and again in the fall and winter of 35,000,000 eggs of the fall or winter-spawning fish, such as whitefish and ciscoes.

It is the intention to build ponds for black bass in connection with this hatchery, where the bass can deposit their eggs naturally, and the young bass be collected and distributed. Comparatively few people know that black bass have never been hatched artificially like trout, mascalonge, pike, perch, shad, whitefish, etc. The nearest approach has been to confine a limited number of bass in one or two artificial ponds so constructed that after the eggs were hatched and the young old enough, the adult bass were taken or driven out of the ponds and the young collected and fed until they could be distributed. I trust some one will have the time and patience to continue experimenting in the line of artificial bass hatching, as I believe it can and will yet be done. Then, and not until then, will it be possible to supply a sufficient quantity of black bass to meet all the requisitions made by our citizens. The shortening of the legal or open season for catching bass cannot but help to increase the number of these fish.

In the past, all of the bass distributed by this commission, and the same is true of other State commissions, have been obtained by netting where bass were numerous. This has always resulted in strong opposition from the people living in the vicinity where the netting was done. On this account the distribution of the small-mouth black bass has been discontinued, but the distribution of the large-mouth black bass, incorrectly called Oswego bass, was continued from near Clayton, same as in years past. The young bass were obtained from a marshy creek entering the St. Lawrence. The past year's distribution was 116,450, larger than the previous ten years' output.

The Adirondack Hatchery near Saranac Inn, in Franklin county, has been entirely remodeled and enlarged. Six and eight iron pipes have been laid from the hatchery (a distance of about 2,000ft.) to a point at the bottom of Little Clear Lake, where the water is 50ft. deep and the temperature stands at 42 degrees, and varies only 4 degrees summer and winter. This furnishes the hatchery with an entire system of rearing ponds with an abundance of the very best pure water, making it one of the most valuable hatcheries in the State. Now, it is possible to raise thousands of trout there to eight, ten and fifteen months old before planting them in the streams and ponds of the northern portion of the State.

In addition to the trout hatching, glass hatching jars sufficient for hatching 10,000,000 brook trout eggs have been supplied and put in complete running order.

The location of the Adirondack Hatchery as a distributing point is unsurpassed by any point in the Adirondacks. The surrounding four counties contain hundreds of the very best trout lakes, ponds and streams that are now almost barren of trout. Where fingerling and yearling trout have been planted in this section in the past two years, from some of our other hatcheries, most flattering and enthusiastic reports as to the fishing are at hand.

In 1896 the Legislature appropriated \$5,000 to buy and improve what was called the McKay pond and springs, in the town of Caledonia, Livingston county. This pond furnished power for a saw and grist mill, and after the owners had used the water as they saw fit, it furnished the supply for the Caledonia State Hatchery, located about one-half mile below the mills.

Soon after the commission came into possession of the property, we commenced the cleaning of the springs, and the removing of everything in the vicinity that in any way might prove detrimental in the future. For over seventy years all kinds of foul matter had been collecting in and around these springs. The accumulation varied in depth from 1 to 4ft. All of this had to be removed down to the hard gravelly bottom, over at least an acre and one-half. This process developed quite a large additional amount of water. All of the springs are now clean, and a wall or dike constructed about them to prevent their again filling up. This insures to the hatchery a sure supply of pure water.

At the Cold Spring Hatchery, on Long Island, new ponds have been built, so that the water supply can be fully utilized, and the greatest number of fish possible turned out. With these additional ponds, and the necessary grading that has been done upon the grounds, it makes this plant one of the most attractive in the State.

Another very gratifying fact in regard to this hatchery is, that it has on hand for distribution more fingerlings and yearlings than the total production of the hatchery for three previous years.

At the Beaverkill Hatchery, in Sullivan county, the water supply always becomes so warm in the summer that it is impossible to rear fingerlings, and all the spring's hatch of fry must be taken away by the first or middle of May, on account of the water warming up so very fast at the beginning of hot weather.

Locating a small spring on the hills about 1,200ft. from the hatchery, and finding that it was feasible to pipe the water to the hatchery, a contract was made with the owner of the spring, the commission to collect the water and conduct it to the hatchery for one year without charge, and if at the end of the year the commission wished to continue using the water they could

lease the spring and the right to convey the water to the hatchery for a term of forty-five years for \$100, which would be in full for all rights during said term.

The work of conducting this water to the hatchery was all done early in December, and considering the small amount of water otherwise obtainable, the supply has certainly been worth double the cost, and I recommend that the commission lease the spring.

About 5,000 fingerling trout were reared at this hatchery since the above spring water supply was obtained.

Other springs, situated from 2,000 to 5,000ft. from the hatchery, that will furnish considerable more pure water, can be leased if desired.

The necessary repairs and the improved water supply for each of the hatcheries has had the most careful attention. All of the hatcheries are full to their greatest capacity. New and improved methods are being introduced, and it may be said without exaggeration that the hatcheries of New York State are superior to any of the kind in this or any other country.

The policy adopted by the commission, of planting larger and older fish in addition to fry, is meeting the approbation of the fishing fraternity. From the numerous reports received in regard to the fishing in streams and lakes, where fingerlings or yearlings have been planted, it is satisfactorily shown that the work should be continued, as the results fully warrant the additional expense.

Reports have been received regarding streams and lakes stocked within the last two years with fingerling and yearling brown and rainbow trout (waters that never before contained these varieties), that during the past fishing season specimens varying in weight from 1/2 to 1 1/2 lbs. have been taken. From all over the State come encouraging reports of better fishing. The commission has done more in the way of restocking the streams in the past two years than was ever done before.

An actual count is always made of the fingerlings and yearlings sent out by your commission. Ten thousand fingerlings or 8,000 yearlings make a large carload. Three and fifty thousand fingerlings (thirty-five carloads) have been sent out by your commission inside of three months, and 40,000 yearlings (five carloads) will be ready for distribution next spring.

It is pleasing to know that the fish commissions of other States have commenced the planting of fingerlings and yearlings.

With the continued efforts to have our hatcheries increase their output of fingerlings and yearlings comes the question of expense. Two of the principal items entering into the cost of producing this sized fish is the food and the time taken to prepare it. Recent experiments with new food lead me to believe that the cost of production can be materially reduced.

Experiments in the mode of hatching and rearing young of some varieties of fish previously considered impossible to raise have been successful. I refer to the hatching and rearing in confinement of the red-throat trout. About 100,000 fingerlings of this variety are now at the Caledonia and Pleasant Valley hatcheries. The eggs were taken from the adult fish confined in the hatchery ponds.

We have also been successful in hatching mascalonge eggs by the glass-jar method, and the rearing of the young fry to the length of 4 and 4 1/2 in. in three months.

It has also been found by actual work and experiment that our inland lakes can furnish whitefish eggs in sufficient numbers for the restocking of Lake Ontario and inland waters with this valuable food fish. Over 20,000,000 of whitefish were hatched and planted during the past year, and the supply of eggs was obtained from inland waters of the State.

Previous to the fall of 1896, all of the whitefish eggs hatched by New York State Fish Commissions were obtained from Lakes Ontario and Michigan, in November and December of each year, but on account of storms and scarcity of fish in recent years the number obtained was always very uncertain, and the expenses were sure to be heavy. It is seldom that storms of sufficient strength occur to interfere with our work of collecting eggs on our inland lakes; so that we can now always calculate on obtaining whitefish eggs at a reasonable expense, and as the fishing grounds are within two or three hours from the hatcheries, there is but slight loss in transportation, whereas by the old method it was often a month after the eggs were taken before they arrived at our hatcheries. At present it would be almost impossible to collect under the most favorable circumstances 5,000,000 whitefish eggs at the east end of Lake Ontario. Formerly this was the best spawning ground for whitefish in the lake.

For the past five years plants of whitefish fry have been made by the commission in Lake Ontario, from Charlotte west to Lewiston, and the past summer the fishing off the Niagara county shore has been better than it has been before in thirty years. I state this upon the most reliable information. The fishermen in that section all unite in saying, that if the plants can be continued in a liberal manner the old-time fishing can be restored.

A few years ago the United States Fish Commission and some of the States bordering on the Great Lakes erected large and extensive whitefish hatcheries, some single plants having a capacity for handling 200,000,000 eggs. To-day part of them are running about half their capacity, and others are closed. All of this is due to the great falling off in the whitefish catch. Ten or fifteen years ago some of the best authorities in the country predicted that unless the whitefish were protected at once they would soon be exterminated.

This matter was deemed of such importance that meetings were called by people interested in the subject, and the matter was thoroughly discussed, and the States bordering on the Great Lakes were asked to provide a close season, and to restrict the size of the mesh of the nets the fishermen were using, but on account of the opposition by the fishermen little was accomplished.

Two years ago Michigan passed a law making a close season on whitefish and lake trout during the greater part of their spawning season. These facts demonstrate the necessity for better protection of the comparatively few whitefish that still remain in our State waters.

We have found whitefish in abundance in Hemlock Lake this season, weighing from 3 to 10 lbs. each. A small plant of whitefish was made in one of our northern inland lakes in 1894-5. This fall we found that these whitefish had attained an average weight of 1 1/2 lbs. each, and that they were abundant.

In my report of a year ago, mention was made of the satisfactory results attending the breeding of the Mongolian or ring-necked pheasants, carried on in connection with the Pleasant Valley Hatchery, near Bath, Steuben county.

The past year the work has been continued as far as the limited space on the grounds would permit. Having no special appropriation for this work, it has not been pushed as far as recent results would warrant. From a dozen birds in the spring of 1897, the flock has increased to 180 fine, healthy birds at the present time. This fully warrants the commission asking for an appropriation to carry on the work. It does not come directly under the Hatchery Department, but the work has been directed by Commissioner Babcock, chairman of the committee having charge of that branch of the work.

For the past year the pheasantry has been one of the great attractions for the numerous visitors to the Pleasant Valley Hatchery grounds.

The mascalonge hatching is carried on at Bemus Point, on Chautauqua Lake. It was here that these fish were first hatched artificially by the old Fish Commission of the State of New York.

Hatching mascalonge eggs has always been done in boxes with a double wire screen top and bottom, and arranged in the lake. The State owns a storehouse at the point conveniently located, in which all the bulky appliances for carrying on the work are stored. This building is also the headquarters of the men during the hatching season, which lasts about six weeks.

Until the past season it had been considered impossible to successfully hatch mascalonge eggs in any way except in the boxes mentioned. A lack of water at the proper elevation permitted of our operating only a few of the glass jars, but they demonstrated what could be done. The experiment was highly successful, and it is perfectly safe to say that with a hatching house properly equipped the annual output of fry can be doubled. This is important, as the growing scarcity of mascalonge in the St. Lawrence River has been apparent for some time.

Your commission is the only Fish Commission (the Wisconsin Commission excepted) that makes provision for the artificial propagation of mascalonge.

Experiments in rearing the fry in confinement were also made during the past season. The fry were hatched on the 19th day of May and placed in a small artificial pond. They were removed from the pond on the 19th day of August, having attained the length of 4 and 4 1/2 in. We could not keep them in the pond longer, as, owing to dry weather, the water supply failed on the date last above mentioned.

The fishing in Chautauqua Lake for mascalonge and black bass cannot be excelled in any other lake of our State. This is entirely due to the disposition of the part of the inhabitants in the vicinity of the lake to abide strictly by the game and fish laws, and to the liberal planting of young mascalonge in the lake by your commission.

In the last report of your commission it was suggested to the members of the Legislature that they pass a bill giving the Fish Commission power to stop all fishing on small streams where they think the situation demands it, for a period of from three to five years. I think it essential that the commission have the power to stop fishing entirely in the small brooks tributary to the Adirondack lakes or streams. These small brooks rarely contain a trout over 5 in. in length. As soon as the trout reach that size, they always drop down out of the brook and into the larger waters below. These small brooks are the nurseries, and my observation is that all through the Adirondacks you will find plenty of people that are continually fishing these brooks for small trout. Not one of their catch is of the legal size, but no one will make a complaint against them. In many cases the proprietor of a hotel, or a boarding house, keeps one or two boys, or a man, continually at work fishing the brooks so that his table may be supplied with so-called brook trout.

In planting young trout from the hatcheries, especially in the spring or fall, it is desirable that they should be planted in these nursery brooks, and our attendants are always instructed to have them planted in such brooks when possible; but when these fish are caught out before they have had a chance to reproduce, or to attain legal size, it will be slow work for our hatcheries to restock such waters as the Fulton Chain of Lakes, Cranberry Lake, with its many tributaries, and the many lakes in other sections in the Adirondacks. When it is possible to stop fishing at all times on these small brooks, then can we expect the quickest and best returns for our labor of stocking.

I cannot help referring to the fish car, the property of the State, and the very important part it has taken in transporting the product of the hatcheries. During the year it has made forty-six trips with fish, each time loaded with from 100 to 125 cans. It would be impossible to deliver our yearly increased output without this car.

Your commission thought it advisable to erect a building for the protection of this car from the elements. Consent was obtained from the New York Central & Hudson River Railroad Company to erect such a building on their property in Caledonia. They kindly laid the necessary track into the car house, so that now when the car is not in use it has proper protection and care.

In this connection I wish to call attention to the liberal and continuous courtesies extended to the commission by the railroads of the State in hauling free the State fish car, with the necessary crew in charge, and transporting fish and fish eggs with attendant, and returning the empty cans free in the baggage cars of their lines.

The following is a record of the distribution from each hatchery, and the total summary of all for the year ending Sept. 30, 1898:

Adirondack.—508,060 brook trout; 147,140 brown trout; 23,000 rainbow trout; 130,000 lake trout; 3,250,000 brook trout.

Beaverkill.—774,875 brook trout; 86,700 brown trout.

Caledonia.—365,112 brook trout; 367,268 brown trout; 45,125 rainbow trout; 368,786 lake trout; 1,000 red-throat trout; 18,300,000 whitefish; 65,000 fresh-water shrimp.

Clayton.—15,000,000 ciscoes; 5,800,000 whitefish; 115,100 large-mouth black bass.

Chautauqua Lake.—2,650,000 mascalonge.

Oneida.—50 pickerel; 17,550,472 pike-perch; 1,350 small and large-mouth black bass; 2,562,800 yellow perch.

Cold Spring.—466,000 brook trout; 93,835 brown trout; 44,485 rainbow trout; 48,000,000 tom cods; 48,000,000 smelt; 6,550,000 lobsters; 1,214,800 shad.

Catskill.—1,500,000 herrings; 3,882,600 shad; donated to State waters by the United States Fish Commission, 5,800,000 shad.

Fulton Chain.—790,750 brook trout; 55,000 brown trout; 199,000 lake trout; 1,500,000 frostfish.

Pleasant Valley.—295,250 brook trout; 120,800 brown trout; 75,400 rainbow trout; 29,000 lake trout.

Sacandaga.—858,000 brook trout; 90,000 brown trout; 187,000 lake trout; 1,035,000 frostfish.

Total summary of fish planted from Oct. 1, 1897, to Oct. 1, 1898:

Brook trout—3,964,500 fry; 72,785 fingerlings; 20,762 yearlings and older; total, 4,058,047.

Brown trout—857,000 fry; 34,640 fingerlings; 69,103 yearlings and older; total, 960,743.

Rainbow trout—119,000 fry; 33,500 fingerlings; 35,760 yearlings and older; total, 188,260.

Lake trout—762,000 fry; 133,725 fingerlings; 18,786 yearlings; total, 914,511.

Pike perch—17,550,250 fry; 222 yearlings and adults; total, 17,550,472.

116,450 bass; 2,562,800 yellow perch; 1,000 red-throat trout; fingerlings; 50 pickerel; 1,500,000 herrings; 6,550,000 lobsters; 48,000,000 tom cods; 48,000,000 smelt; 15,000,000 ciscoes; 5,785,000 frostfish; 2,650,000 mascalonge; 24,100,000 whitefish; 10,897,400 shad; 65,000 shrimp; total, 188,899,733.

Report of Chief Protector.

Maj. J. Warren Pond, Chief Protector, reports:

The following devices, which were being illegally used for catching fish, have been captured and destroyed:

56 seines, 971 fyke nets, 320 trap nets, 584 gill nets, 221 squat nets, 2 pound nets, 17 dip nets, 65 tip ups, 13 spears, 457 set lines; total number of devices destroyed, 2,706; valued at \$29,515.

Three hundred and sixty-nine persons were prosecuted during the year for violating the fisheries, game and forest laws. Of this number 335 were convicted, 30 discharged, and 4 held to grand jury. The total amount of fines, penalties and costs imposed by the courts in these cases was \$10,827.49, of which \$8,480.94 has been collected by the department and deposited in accordance with law, and an aggregate penalty of 735 days' imprisonment has been imposed.

I think this is an excellent showing, and I confidently assert that all statements, from whatever source they proceed, that the fisheries, game and forest laws are everywhere disregarded and violated, are reckless statements of persons who have no knowledge of the subject. Doubtless, violations have occurred which have not come to the knowledge of the department. This is inevitable, owing to the fact that it is impossible to cover the whole State with the limited number of protectors that we are allowed by law. But it is certain that the number of these cases is not so great as some would make it appear. Several reports of violations of the deer hounding law have reached me, every one of which has been carefully investigated and found to be based upon evidence so flimsy as to discredit the report.

In some localities of the State there is a manifest unfriendliness to the laws for the protection of fish and game, so much so that it is impossible to secure convictions in the local courts. In several cases an acquittal or a disagreement of the jury has resulted from the plea of the defendant's counsel that the protector or the complainant was out for "blood money," meaning his share of the fine if conviction is had.

In one of the courts in Greater New York a person arraigned under section 78 of the fisheries, game and forest law for shooting song birds was discharged on the ground that section 1493 of the charter of that city supersedes the fisheries, game and forest laws. For the same reason moneys collected as fines for violations of the fisheries, game and forest laws have been turned over to the city comptroller instead of to this department.

This will necessitate a civil action to obtain an opinion of the higher court as to the true meaning of the law.

The St. Lawrence River Park.

Pursuant to the provisions of chapter 273, laws of 1897, this commission has purchased several points on the River St. Lawrence to be used by the public for the purpose of recreation, camping, fishing, etc. The tracts purchased and prices paid therefor are as follows:

Burnham's Point, near Cape Vincent, \$500; Cedar Point, between Cape Vincent and Clayton, \$1,400; Canoe Point, on Eel Bay, \$4,200; Watterson's Point, on Canadian side of Well's Island, \$700; Mary Island, opposite Alexandria Bay, \$5,000; Kring's Point, near entrance to Goose Bay, \$2,300; one-half of Cedar Island, near Chipewa Bay, \$3,000; one-half of Lotus Island, nine miles below Ogdensburg, \$4,500; De Wolf Point, on Lake of the Isles, \$500.

These islands and shore points are well located, easy of access and in every way suitable for public park purposes. This commission has contracted with a responsible person for the construction of docks for steamers and row boats, wherever necessary. These grounds have been cleared of fallen timber, underbrush, loose stones, etc.

Suggestions and Recommendations.

We recommend that there be a close season of one month for whitefish during their spawning season. With the work being done by the commissioners in stocking lakes and the close season of one month, while spawning, we feel confident that this most valuable fish can be restored to the Great Lakes and made plentiful in several of the smaller ones throughout the State.

The commissioners having made a successful start in rearing game birds, have gone as far as their very limited means would permit, and would recommend that an appropriation be granted for the construction of suitable enclosures and the further continuance of the work. With the birds on hand and a small appropriation, 500 Mongolian pheasants could be reared and distributed this year.

We recommend that the law of 1898, which provided a bounty for the seizure and destruction of illegal devices

for the taking of fish be amended by the reduction of the bounties, and a safeguard against a repetition of the frauds that were practiced during the past year.

We recommend that an appropriation of \$2,000 be made for the care and maintenance of the lands recently purchased on the St. Lawrence River.

Massachusetts and Maine.

BOSTON, Feb. 11.—The feature of the week in Massachusetts fish and game circles is the introduction into the Legislature, now in session, of a bill to prevent, by a very stringent law, all fishing and shooting on Sunday. Under the common law such action is an offense, but nothing is ever done toward enforcing the law, and farmers and country residents complain that their lands and woods are overrun by gunners on Sunday. The proposed law not only provides a penalty, but makes its enforcement obligatory. But the bill will not go through without opposition. There are members of both branches of the Legislature who have indulged in Sunday shooting and fishing on many occasions, and would like to do so again.

On the other hand, the Maine Legislature has a proposition now before it to repeal the clause in the game laws making it an offense to hunt on Sunday—to repeal the clause so far as the back towns are concerned, but leave it in force in the larger or inhabited towns. In that State there is no clause in the game and fish laws against fishing on Sunday. Now the Maine law says that it is wicked to shoot on Sunday, but not fish.

Capt. Fred C. Barker, of Bemis and the Birches, is back from a short vacation trip to Cuba. He went for a much-needed rest, in connection with looking at "our new possessions." He says that he would not give up the Maine woods and waters for the whole island. He will go ahead and add to the attractions of his places on Mooselucmaguntic, and have them ready for the rod and line sportsmen, as soon as the telegraph announces that the ice is out.

SPECIAL.

Connecticut Shad Fishery.

THE Connecticut Fish and Game Commissioners give this graphic showing of the results of shad culture; and as was said in the report printed in our last issue, future years promise to show an increase yet more abundant:

SHAD CAUGHT IN THE CONNECTICUT RIVER FROM 1890 TO 1898, INCLUSIVE.

Years.	Number.
1890	34,318
1891	22,462
1892	18,965
1893	41,253
1894	31,145
1895	62,597
1896	57,318
1897	73,367
1898	93,450

The Fruits of Protection.

MANCHESTER, N. H.—*Editor Forest and Stream:* I see by report from our Legislature now in session, there is notice of a bill to repeal all fish and game laws, abolish the commission, and throw away all the good work that has been done in New Hampshire. I know there has been a great deal of good done to keep up the supply of fish and protect the game. I know of trout streams that have been stocked for years, and have given good results, where there would not be any fish if they had not been stocked. It is a pleasure to follow up a stream you have put fry into later and see the little fellows dart for cover, or show themselves in some clear pool. The protection and stocking of lakes and streams have been the means of bringing thousands of dollars to our State from summer boarders, and those that like to fish and hunt. But we have a class that will kill the goose now sitting for the tasteless and worthless meat of the mother goose, rather than have the dozen of fat young geese in the fall. Such is human nature. We need more protection instead of less, and will hope the law may be made better instead of worse.

OLD ONE.

The Kennel.

Fixtures.

BENCH SHOWS.

Feb. 8-11.—Milwaukee, Wis.—Bench show for the benefit of the Wisconsin training school for nurses. E. J. Meisenheimer, Sec'y.

Feb. 21-24.—New York.—Westminster Kennel Club's twenty-third annual show. Jas. Mortimer, Sec'y and Supt.

March 7-10.—Grand Rapids, Mich.—Butterfly Association's bench show. Miss Grace H. Griswold, Sec'y.

March 14-17.—St. Louis, Mo.—St. Louis Kennel Club's show.

March 21-24.—Chicago.—Mascoutah Kennel Club's show.

April 4-7.—Boston, Mass.—New England Kennel Club's bench show. James Mortimer, Manager.

Nov. 22-24.—New York.—American Pet Dog Club's show. S. C. Hodge, Supt.

The Binghamton Show.

BINGHAMTON, N. Y., Feb. 9.—I am sorry to inform you that owing to shortness of time we were unable to make the necessary arrangements to hold bench show, and it is therefore declared off.

A. P. Fish, Sec'y Binghamton Show.

Irish Setter Club Meeting.

PHILADELPHIA, Pa., Feb. 12.—*Editor Forest and Stream:* The annual meeting of the Irish Setter Club of America will be held in the Madison Square Garden, New York, on February 22, at 11:30 A. M., during the W. K. C. Show. GEO. H. THOMSON, Sec'y, 278 City Hall.

The index for Volume LI. of FOREST AND STREAM, which appears with this issue, will be found in all mailed copies, and will be furnished to others without charge. Those who desire to bind their volumes may save themselves and us some trouble by taking pains that their index is not lost, as it may well be, since it is not stitched in with the number in which it is inserted.

Trap-Shooting.

Fixtures.

Feb. 13 and 22.—Newark, N. J.—On Lincoln's and Washington's birthdays respectively, on Smith's grounds, Foundry street and Ferry street, a 15 live-bird event each day; open sweepstakes also; class shooting.

Feb. 15-16.—Reading, Pa.—Live-bird tournament of the Reading Shooting Association. Geo. G. Ritter, Manager, Reading.

Feb. 15.—Bergen County Handicap, third contest, 15 live birds, open to all, \$10 entrance, birds included, at Helfrich's Hackensack Bridge grounds.

March 1.—Brooklyn, L. I.—Monthly shoot of the Brooklyn Gun Club. John Wright, Manager.

Feb. 21-22.—Garden City, L. I.—Amateur championship contest under the auspices of the Carteret Gun Club.

Feb. 22.—Fremont, Neb.—All-day shoot of the Fremont Gun Club; targets and live birds.

Feb. 22.—Rochester, N. Y.—Live-bird and target shoot of the Rochester Rod and Gun Club.

Feb. 22.—Lebanon, Pa.—Keystone Gun Club, of Lebanon, Pa., all-day live-bird and target tournament; open to all. A. E. Smith, Captain.

Feb. 22.—Altoona, Pa.—Target tournament of the Altoona Rod and Gun Club. G. G. Zeth, Sec'y.

Feb. 22.—New Haven, Conn.—New Haven Gun Club's tournament; \$20 added money. J. B. Savage, Sec'y.

Feb. 22.—Worcester, Mass.—Tournament of the Worcester Sportsmen's Club; targets. A. W. Walls, Sec'y.

Feb. 22.—Lebanon, Pa.—Keystone Gun Club's live-bird and target tournament.

Feb. 22.—Dexter Park, Brooklyn.—All-day open shoot at live birds. H. S. Lippack, Manager.

Feb. 28.—Lyndhurst, N. J.—Live-bird tournament of the Brooklyn Gun Club. John Wright, Manager.

March 1.—White Plains, N. Y.—Fifteen live-bird handicap, \$10 entrance, birds included. E. G. Horton, Manager, White Plains.

March 2-11.—Madison Square Garden.—Tournament in connection with Sportsmen's Exposition. Address, Sportsmen's Exposition, 280 Broadway, New York.

April 4-5.—Chambersburg, Pa.—Chambersburg Gun Club's spring live-bird and target tournament; open to all. J. M. Runk, Captain.

April 6-8.—Utica, N. Y.—Fulford's handicap at live birds. E. D. Fulford, Manager.

April 11-13.—Elkwood Park, Long Branch, N. J.—The Interstate Association's seventh annual Grand American Handicap tournament.

April 18-20.—Lincoln, Neb.—The Lincoln Gun Club's second annual interstate tournament; targets and live birds; \$500 added. Geo. L. Carter, Sec'y.

April 18-21.—Baltimore, Md.—Prospect Park Shooting Association's tournament; \$500 added. Stanley Baker, Sec'y.

April 25-28.—Baltimore, Md.—Tournament of Baltimore Shooting Association; targets and live birds; money added. Geo. L. Harrison, Sec'y.

May 2-5.—Lincoln, Neb.—Nebraska State Sportsmen's Association's twenty-third annual tournament, under the auspices of the Capital City Gun Club; six amateur and four open events each day; targets and live birds. R. M. Welch, Sec'y.

May 9-13.—Peoria, Ill.—Illinois State Sportsmen's Association's tournament. C. F. Simmons, Sec'y.

May 16-19.—Erie, Pa.—Ninth annual tournament of the Pennsylvania State Sportsmen's Association, under the auspices of the Reed Hurst Gun Club. F. W. Bacon, Sec'y.

May 16-20.—St. Louis, Mo.—Tournament of the Missouri State Fish and Game Protective Association. H. B. Collins, Sec'y.

May 23-25.—Algona, Ia.—Tournament of the Iowa State Association for the Protection of Fish and Game. John G. Smith, Pres.

May 24-25.—Greenwood, S. C.—Annual live-bird tournament of the Greenwood Gun Club; 25-bird Southern Handicap. R. G. McCants, Sec'y.

May 30.—Canajoharie, N. Y.—All-day target shoot at Canajoharie, N. Y. Charles Weeks, Sec'y.

May 30-June 2.—Erie, Pa.—Ninth annual tournament of the Pennsylvania State Sportsmen's Association, under the auspices of the Reed Hurst Gun Club. Frank W. Bacon, Sec'y.

June 6-9.—Sioux City, Pa.—Fifth annual amateur tournament of the Soo Gun Club. E. R. Chapman, Sec'y.

June 7-9.—Columbus, O.—Tournament of the Ohio Trap-Shooters' League, under the auspices of the Sherman Rod and Gun Club. J. C. Porterfield, Sec'y, O. T. S. L.

DRIVERS AND TWISTERS.

The programme of the shooting tournament, to be given at Fremont, Neb., on Feb. 22 and 23, has nine events for the first day, eight of which are target events, alternately 10 and 15 targets, 50 cents and \$1.50 entrance respectively, except the eighth, which is \$1. The ninth is at 10 live birds, \$2.50 entrance; three moneys. There are three moneys in the 10-target events; four in the 15-target events. The programme of the second day provides live-bird shooting exclusively. There are four events, 8, 10, 15 and 10 live birds, the entrances of which are \$2, \$2.50, \$5 and \$2.50. The 15-bird event has four moneys; the others three. A handicap in all live-bird events will be given, from 25 to 32yds. The management invites all to come early and stay all day; plenty to eat; the management will do all in its power to make the meeting a success. The tournament will be held on the fair grounds. The competition begins at 9:30. Ship your guns and shells to Mr. C. C. Beveridge, Fremont, Neb.

A brief note from Mr. C. C. Beveridge (Dominie), who is now in Fremont, Neb., informs us that the thermometer was 35 degrees below zero on Feb. 8. He mentioned it as a calm, uneventful state of affairs, but if he could have witnessed the kettle full of cold and snow and wind which the weather clerk mixed up and then sifted over this section, he would have thought that 35 below zero was a mere ginger snap. The Dominie has been shooting some live birds recently, and it may be that as he shoots in Nebraska he looks out of the corners of his eyes toward Elkwood. He will return to New York about April 1, where he will find a warm welcome in the old circle.

The terrific blizzard which set in Sunday and raged all day Monday spoiled many of the shoots which were fixed for Feb. 13, Lincoln's Birthday. All last week, the thermometer in the north coquetted with the zero point, with some fitful snowstorms on different days, but the daddy storm came in at the finish, and broke all the records of many years. The hero who ventured forth on Monday to shoot targets was greater than he who taketh a city.

Owing to the blizzard which raged on Feb. 13, the date fixed for the championship of New Jersey contest, of which the E. C. cup is emblematic, Messrs. T. W. Morley and Harold Money, the principals, agreed to a postponement to Feb. 25. The match will be shot at Lyndhurst, N. J., as previously arranged, and there will be the same target and live-bird programme as that fixed for Feb. 13.

On Feb. 17 the Handicap Medal Contest, open to all residents of Chicago, will be contested for in the first shoot of the series, which will be held on the first and third Fridays of each month, commencing at 1 o'clock P. M., on John Watson's grounds, Burnside Crossing, Ill.

Owing to the exceedingly cold weather, there were but two members of the Owl's Head Gun Club present at their weekly shoot at Dexter Park, L. I., on Feb. 10, namely, Mr. J. S. Remsen and J. H. Hallock. In one 10-bird event Mr. Remsen killed 8; Mr. Hallock, 6. In another, Mr. Hallock killed 9, Mr. Remsen 8. Mr. Edward Banks and J. P. Milliken were visitors. The former scored 22 out of 25 live birds with one or two dead out of bounds.

Mr. E. C. Burkhardt defeated Dr. E. S. Carroll in the contest for the Clinton Bidwell trophy on Saturday last by the score of 20 to 19. The former lost three dead out; the latter two. The next contest for this trophy will be between Messrs. E. C. Burkhardt and C. S. Burkhardt, on Feb. 22, at Audubon Park, beginning at 2 P. M.

The Oceanic Rod and Gun Club and the Hudson Gun Club will shoot their second match of their series on the grounds of the latter club on March 13. The Oceanic won the first match on an extremely narrow margin, therefore the presumption is that the Hudson Club will bestir itself and give the Oceanic a race such as it never had before.

There were six members present at the shoot of the Rochester Gun Club last week, Wednesday, notwithstanding the cold temperature, high wind and flying snow. In an event at live birds, Glover and McCord killed 10 straight. If they can do that in the Grand American Handicap, and add fifteen more to it, they will be in a good position.

Under date of Feb. 10, Mr. E. G. Horton, 100 Railroad avenue, White Plains, N. Y., writes us that Miss Annie Oakley will enter the handicap at White Plains on March 1. He adds: "Everything looks rosy. Several, during the past week, have promised to enter in this shoot, and I feel assured of a pleasant and successful shoot."

There seems to be some misapprehension concerning the weight of guns and bores allowable in competition in the Grand American Handicap. Mr. Edward Banks, secretary-treasurer of the Interstate Association, sets forth the matter clearly in a letter published this week in our trap columns.

Owing to the numerous shoots about the end of the month, Mr. John Wright, manager of the Brooklyn Gun Club, has decided to postpone the club's live-bird shoot till after the Sportsmen's show, in March.

The Jeannette Gun Club will hold its regular shoot on the grounds of the Columbia Fishing Club, Eltingville, S. I., on Friday of this week.

On Feb. 22 there will be an open all-day shoot at live birds at Dexter Park, Brooklyn, L. I. H. S. Lippack, manager.

Mr. E. S. Rice, Western agent of the Hazard and Dupont Powder Co's, was a visitor in New York last week.

Mr. Chas. Schmelter, of Kansas City, was in evidence about Sportsman's Row, Broadway, New York, last week.

BERNARD WATERS.

Confabulations of the Cadi.—XVI.

THE programme for the day had a total of ten events, varying from 15 to 20 targets, excepting one, a team race at 25 targets. Any team whose members were bona fide members of the clubs which they were representing was eligible to competition in the team event.

In practice, in reference to the foregoing, bona fide is commonly accepted in Egypt as implying that the members of the teams lived somewhere in the same section of country wherein their clubs have their domicile, and that if they were not really members they were at least acquainted with some of the members. In organizing a team of good shooting abilities, it is thus at times in Egypt deemed quite necessary to construe the matter of eligibility quite liberally. If a team happens to be organized of members and non-members, it is many times, in Egypt, kindly winked at, unless the team should in an ungracious moment happen to win.

Notwithstanding that many matters of detail concerning the conduct of the shoot were put off until the last moment, it opened merrily. Moke, who was acting as squad hustler and referee, had about a dozen things on his mind, and though he forgot two or three every moment, he forthwith replaced them by remembering two or three others, or had them forced on his attention by the shooters who were anxious to begin the competition. He bustled about, starting with great determination to settle one matter, then changing his mind before he had accomplished anything, so that most of the time he was industriously making beginnings and nothing more. It at length came to the point where all unfinished business had to be abandoned, and the merry contest formally begun.

Moke held the score sheet in his hand, and in a loud voice cried out, "Squad No. 1 shoots. Pachyderm McGinty, No. 1. Theophrastus Rooney, No. 2. Euclid Jones, No. 3. Crocodile Dennis, No. 4. Praxitiles Bummer, No. 5. Some Pumpkins, No. 6. Are you all ready?"

Every man was in his place, excepting Some Pumpkins. Moke flew here and there, from one group to another, shouting "Some Pumpkins!" He hurriedly asked if any one knew Some Pumpkins or had seen Some Pumpkins. At length he approached a manufacturer's agent who was showing the mechanism of a gun to a small, hypnotized gentleman with a matted yellow beard.

"As I was remarking about the phenomenal killing powers and the everlasting durability of this gun," said the agent, "I only desire that you will look over this record which I happen to have with—"

"Some Pumpkins! Pumpkins! Does anybody know Some Pumpkins?" exclaimed Moke, in despairing query, as he drew near.

"Some Pumpkins? Why, I'm Some Pumpkins," replied the yellow-bearded gentleman. "Who wants me?"

"Why in the Moses don't you answer your name when you are called? You are delaying this shoot. Get your gun, quick, and go to the score! And next time, Punk, when you are called, answer."

"Pumpkins isn't my name," said the bearded gentleman, somewhat nettled. "I'm Mummy the Kid, from the Libyan country."

"Then who's Pumpkins?"

"I'm Pumpkins," replied Mummy. "That's my nom de fusil. I adopted it this morning for the first time and forgot all about it till you came here this moment."

"This is dog-gasted rot," retorted Moke. "Why in the name of common sense do you not use your own name? You are bright enough to recognize it, and it is a better name too."

"I'm just as good as any one else," replied Mummy, "and I have noticed that it seems to carry a distinction as being something out of the ordinary when one feebly tries to conceal one's identity at a shoot by an assumed name. I like to shoot incog."

"Men who use a shooting name do so in most instances because as a business reason they do not care to have published where they are during business hours—but, Mummy, you seem to do it out of a silly vanity. You are No. 6, and if you do not get there in a hurry your name in about two minutes will be Mud."

Moke returned hurriedly to the squad, which was murmuring with discontent. "Play ball!" he exclaimed, in the voice of authority.

McGinty immediately put his gun to his shoulder, stood in a natural position, yet with faculties intensely alert, called "Pull" in a natural and distinct tone of voice, and broke the target with such ease and quickness that it seemed to be a most trifling feat, requiring no effort in its accomplishment. Whether he hit or missed, he maintained the same equable composure, neither

voice nor manner changing at any fluctuation of success, as is becoming to him who aspires to be a class man. He who stops to express regrets, or register anathema, or explain how it all happened, it not concentrating his energies to the best purpose in a contest of skill with the gun.

Moke was keenly alert, and promptly called out "Dead." Rooney, at No. 2, the moment No. 1 had fired, put his gun to his shoulder, humped up his back in a most misshapen manner, half-twisted his body, bent his knees at a knee-sprung angle and thereupon there issued from him a roar not unlike the hoarse bellow of a bull, frightened and angry when caught and doubled up amidship on the horns of a fierce rival. He simply had in his own way bellowed "Pull!" He caught a straightaway, hit it full and ground it up so fine that, excepting a thimblefull of dust, it was snuffed out instantly from sight.

"Lost!" said Moke, in a sing-song voice.

"What!" said Rooney. "Where are your eyes, man? I snuffed that target out!"

"Lost target!" said Moke, without the least perturbation.

The whole squad stood aghast. At length McGinty found his voice, and declared that the target was broken. Jones, Dennis, Bummer and Pumpkins loudly supported him. Still Moke declared that it was a lost target.

"Why, it's contrary to the fact, the rules, and common sense," hotly declared Rooney.

"The facts are governed by the rules, and the rules are in a way governed by the facts," replied Moke, "but as to common sense I, as referee, cannot admit for a moment that there is any which is left out of the rules. I will have you understand that I am deciding this matter strictly according to the rules, and to settle the matter once for all I will read you the rule governing it," saying which Moke pulled from his pocket a folder and read as follows: "A target to be scored 'broken' must have a perceptible piece broken from it while in the air. A 'dusted' target is not a broken target! Now, did any of you gentlemen see a piece broken from that target in the air?"

There was no piece, they all declared, but the fact that it was snuffed out of sight in midair was sufficient evidence that it was broken.

"If it was, snuffed out of sight, then how could you see it?" Moke retorted. "The rule is mandatory, for it states that to be scored broken a perceptible piece must be broken from it while it is in the air. I can only decide by the rules, gentlemen, and under them it is a lost target."

"Where the law ends, equity begins," said a famous moose hunter from Bitter Creek, who had been listening attentively to the debate.

"The law hasn't ended in this case," retorted Moke. "It has only just begun. Play ball."

No. 3 twisted himself sidewise, reached his left hand out nearly to the muzzle of his gun, and his right foot far back as it could be extended. He was very successful in breaking straight-away targets, but right and left-quarterers were frequently missed. He shot and missed.

No. 4, who was Crocodile Dennis, stood very erect, with his head thrown far back in statuesque pose, so far back of the center of gravity that he had to exercise great care that the mere calling "Pull" did not throw his gun out of alignment.

Bummer, who was at No. 5, held his gun well below the elbow, threw it hurriedly to his shoulder after the target was well on its way, and snapped at it without the slightest attempt at aiming, with the result that he made some very pretty shots and some equally pretty misses.

Mummy the Kid, alias Some Pumpkins, was the pivot man. He had a 10-bore, in which he shot 4drs. of black powder, and every shot that he fired could easily be distinguished from all the others.

At the end of the 15 shots the score stood McGinty 14, Rooney 13, and all the others 11. Moke, who was itching to shoot, and had his mind much more on it than on the managing, here asked McGinty to referee the next squad, who obligingly consented. Moke hurriedly got his gun and shells, and told one of the shooters who was already in the squad that he had been transferred to the last squad, and the shoot then went on. Moke broke 15, and was the only man with a straight score up to that time. He had intended to resume the management of the shoot as soon as his squad finished, but his mind was on that straight score, and he watched the score sheet after every shot to see how the scores stood. When a shooter missed, Moke smiled with pleasure. When one was shooting with such skill that a straight score seemed imminent, he looked dark. However, two men in the last squad broke 15 straight, and the three divided. Moke was exceedingly irritated at this, for he had expected to take first money all alone, and although he was shooting for fun, as became a good amateur, he was not entirely oblivious to the value of money or the getting as well as the losing of it.

Moke entered afterward in every event, and thereafter was a most inefficient manager. In the second event there were three moneys. There were two 15s, four 14s, no 13s and four 12s. If no one of the 14s missed a bird the 12s would be in the money. Mummy the Kid, who had 13 to his credit when the last round began, was the last man to shoot, and if he broke the target, all was well with the 12s. But Mummy apparently didn't care much whether he broke or missed. He missed, and took third money all alone, and the 12s got nothing.

Then there were angry protests and accusations of dropping for place made against him, and many more angry threats of putting up of guns and of going home if Some Pumpkins was not forthwith ejected from the grounds for good and all. The latter was a small man; so at length Moke took him by the collar and said to him, "Vile creature, avant; you have dropped for place, and I must fire you!" He forced him to take his gun in one hand and his ammunition box in the other, and then walked him urgently toward the entrance, near which they met two new arrivals, Reddy the Shoemaker and Sir J. Augustus Smith, of Smithtown-on-Hudson. They gazed with amazement at the sight of Moke with a firm grip on the back of Mummy's collar, walking him out.

"What's the matter with my old friend Mummy?" exclaimed Reddy.

"He took a drop too much," Moke replied.

"Intoxicated," remarked Reddy to Smith, as they hurried on. He was a pious man, was Reddy, and he made sundry remarks about the depravity of a man who would put that in his mouth which would steal his brains away, but nevertheless left his friend in distress to his own shifts. He told the incident to his friends and his friends' friends, with the result that Mummy had a reputation as a hard drinker from that day ever afterward in the section round about where Reddy lived, and the reputation of a hardened rascal elsewhere; all of which came from an ability to do better and oftener that which the others could only do awkwardly betimes.

The Cadi, who was acting as cashier, had taken in some good sums of money, but had kept his accounts very loosely, having trusted to memory. Owing to the difficulty in making change, con-

sequent to the lack of foresight or negligence in starting business with an empty till, he had small unsettled accounts with every shooter, ranging in sums from dimes to dollars, which he owed or which were owed to him. He remembered each item clearly at first; but as they began to increase in number and variety, there was some confusion in his mind, which later increased into total uncertainty concerning them. Some of the shooters entered for targets only, but there was nothing in his book which distinguished those who entered so from those who entered the sweepstakes. He also was so intent on exchanges of greetings and bon mots with distinguished shooters whom he knew, or to whom he was introduced, that the other shooters could not make their entries so promptly as they wished to; so that, aside from the mere taking in of the money and the writing down of the names, he knew as little of the details of the cash department as did any man on the grounds. The shooting was delayed now and then on this account early in the day, but later, when some men wanted their winnings so that they would have the funds to re-enter; when others again wanted the change which was due them, or asked what a straight score paid in the last event or who was in for targets only, the cash department was chaotic.

There was then a long delay in readjusting, as a court of inquiry was necessary as to who was in for targets only, and who had paid and who had not, etc., all of which was just so much loss to the club; for, when the traps stop throwing targets, there is no revenue coming in. While, on the other hand, the expenses of running the tournament go on just the same.

And the traps, too, were working badly, and there were many delays fixing wires and springs, which should have been mended and adjusted a day or two at least before the tournament began. From a merry start the tournament evolved into an irritating, unpleasant affair, with more or less of open discontent and indignant denunciation of the management, and declarations of an intent to stay away from its shoots in the future.

In the third event the scores were all mixed up, the error apparently being caused by the boy who was acting as scorer having skipped a target, thereby marking down to No. 1 a target lost by No. 2. Thus, the error being perpetuated, each shooter's score was partly his own and partly that of some one of the others. Some scathing rebukes were given the boy for his stupidity, but he boldly made the defence that there were always two or three shooters on each side of him, bending over his shoulders with their noses within a few inches of the score sheet, scanning it and talking so volubly and withal so loudly that he could not hear Moke half the time when he called "lost" or "dead," and that Moke himself was the most frequent offender in his anxiety to see with whom he was tied, or whether he was lucky in getting into a place alone. Moke promptly retorted by telling the boy that he was star-gazing most of the time when he was not listening to the conversations of those about him—all of which was not extremely edifying to those who wished to shoot in a peaceful and orderly manner.

Thereafter, all the shooters lost confidence in the scorer and the scoring, and were captious and contentious. A few who were not over scrupulous presumed on the lack of confidence, and regardless of the facts boldly made claims that their scores were short of a target or two, which claims were not infrequently allowed.

The team race, however, revived interest and infused new activity into the competition. The home club, which was expected to give this event a strong support, had no entry. There was, however, great rivalry between two sections of Egypt, each of which sent teams.

The team of the Bedouin Gun Club had great fame in its own town. The members walked about with expanded chests and a hauteur almost austere in its rigor, for they came from a section of Egypt which had a fame throughout the civilized world for the surpassing excellence and abundance of the mammoth, golden, be-warted squashes which it produced. This, with a large tent, made of fancy-colored, wide-striped awning material, in which they stored their belongings and rested between times when not shooting, they deemed sufficient warrant for an exhibition of all the airs and graces which justly appertain to so much greatness.

Some yards away was the tent of the Libyan Gun Club, many of whose members were old and warm friends of the members of the Egyptian Gun Club. They had shot together in their club shoots, and were supposed to have a clannish tie of friendship, inasmuch as they lived in the same locality. Crocodile Dennis was the captain of the Bedouins; Euclid Jones filled the like office for the Libyans. After the target race was finished, the score showed that the Libyans were the victors by twenty-five targets. The Bedouins made an effort to appear amiable, but the surface indications could not conceal the underlying ugliness of their feelings. They held furtive conferences every few minutes, and the wise and serious nods exchanged indicated that they were all agreed about something.

The Libyans felt a certain pride in their victory, and, wishing to round it out by a show of confidence, they instructed Jones to inform Dennis that they would be pleased to give his team a return match any time that he desired it.

"A return match!" said Dennis, with an affectation of great surprise. "We haven't had any match at all yet."

"You know better, Dennis," rejoined Jones. "We have just shot a match, and we will shoot you another if you care for it."

"Do you call this rotten, put-up-job kind of a thing a match? We are no fools! We know when we are getting the worst of it! When we shoot a match again, we want to shoot with honest people; with gentlemen and sportsmen such as we have in our section. Go to," and Dennis looked angry and warm.

"Why, you fairly astonish me," replied Jones. "I don't know what you mean. Explain yourself?"

"What did you fellows put our team up in a squad by itself for? Yes, what for? Do you think we are infants? Do you think that we don't know that our team, in a squad by itself, had all the hard targets, while you fellows in a squad by yourselves had all easy ones? The angles were all easy, and the targets didn't fly half as far. Any one with half an eye could see it. Shoot another match? Oh, yes, we will—I don't think!"

"You are entirely and egregiously mistaken, Crocodile. It was as fair a race as ever was shot. If we can't win a match fairly we don't care to win at all. Come, let us get the two teams together and talk it over."

"Not as long as my name's Dennis. We have had enough of this deal," saying which he turned contemptuously on his heel and joined his fellows.

In a few minutes the camp of the Bedouins was struck, and they marched forth haughtily, guns and grips in hand, en route to the land of mammoth squashes. The other shooters looked on in puzzled wonderment, and later in talking it over some were quite convinced that the Bedouins were shamefully used, while others maintained that they had absolutely no ground for grievance. When the Bedouins returned to their own section, they told their story with a great deal of elaboration. Their friends told it to other friends, till, what with the natural embellishments which

come with local repetition and the significance attached by local pride, the story as it at last came to be conventionally told was based on the ground that so great was the skill of the Bedouins and so exalted their station, that they excited the most intense envy and hatred, and but for their intrepid bearing they never would have returned home with their lives. Thereafter at home they enjoyed great fame as being invincible in skill and unequalled as diplomats, and it all grew from a grievance existing in imagination.

When the hour came for an intermission to partake of lunch, there was no lunch. Moke thought the Cadi would look after the arrangements for it, and the Cadi had the same touching confidence in the zeal of Moke. When they compared notes, both being more or less responsible for the negligence, they concurred in that it was the business of some of the other members, as they themselves were already overworked with other matters.

There were loud complaints and some unpleasant remarks from the shooters, some of whom had eaten light breakfasts, some none at all, and those who had eaten were quite as ready to eat again; for, be it known, there is no more appetizing work than shooting at a tournament. There is a great deal of physical exertion, and an immeasurable mental strain, so much so that at the end of the day most of the shooters are as weary as if they had been literally sawing wood.

By the omission of the lunch, there was a sullenness in the atmosphere, for, beside the actual deprivation of it, there was a feeling that there was a certain amount of discourtesy shown them in such neglectful treatment.

Several of the most expert amateurs were gathering in the money, which was discouraging to the amateurs who were losing. Seeing that they had no chance to win, many of the latter put up their guns and either looked on or took their belongings and departed.

Moke was heartily weary of his office, as he well might be, with everything running at sixes and sevens. Some of the shooters who noted his apparent inefficiency were presuming on it. Molossus Sphynx in particular was repeatedly offensive. There was a tree in the background with shadows about it, and every time that a target went toward that tree Molossus would strenuously insist that the target was broken, if the referee declared it lost. He would contend that a piece dropped downward against the shadowy background, and that it was as plain as day to any one watching it intently, as any referee of proper ability would watch it. Then he would appeal most frankly to the other shooters, some of whom would declare that they never saw any piece, while one or two would declare that they thought they saw a piece, while again one other, who thought that no shooter should lose what was due him, most sympathetically declared that he saw a piece fall precisely as Molossus claimed. In this manner the latter was undeservedly in the money three times, by the mere force of gall and brassy insistence, supplemented by the indecision of the referee; and the latter was in hot water all the time.

When the day was ended, the Cadi and Moke were weary. Each had made his task unnecessarily difficult, and more or less of a failure by negligence, indecision and error. The Cadi, on looking over his cash, found that he was several dollars short, and his accounts were in such a mixed and imperfect state that he could not trace the loss; in fact, he could not trace any of the day's doings, so far as they concerned the cash accounts. He explained this to Moke, who cocked his eye on him suspiciously, but made no comment.

"I am glad that the programme calls for live birds to-morrow," remarked Moke. "Some of our boldest amateurs, in matters of debate, quit before the programme was half over."

"I told you a long time ago," replied the Cadi, "that if you bar the experts—that is, the 90 per cent. men or better—the next most skillful class will then be the experts, and that the relative conditions of the competition will then remain unchanged. If you will note the practical workings of a competition where there are a mixed lot of shooters in it, you will find that the stronger shooters are the most persistent, whether they win or lose, and that the weaker shooters never shoot more than a certain percentage of the programme, whether the money is won by the experts or the semi-experts. It is natural that, as men of sense, they should not shoot more than they can afford to shoot. But whatever class you bar in an effort to mend the interests of other classes, you will find that,

"Great fleas have little fleas upon their backs to bite 'em,

And little fleas have lesser fleas, and so ad infinitum.

And the great fleas themselves, in turn, have greater fleas to go on;

While these again have greater still, and greater still, and so on."

BERNARD WATERS.

Monte Carlo.

From the London Field of Jan. 28.

The Grande Poule d'Essai.

FRIDAY, Jan. 20.—The series of big shoots could not possibly have opened under fairer auspices than it did this morning, for, while there was a nice breeze, the air was very mild, and great was the company. As will be seen from the appended returns, there were 103 competitors, this being four more than last year, which was itself a "record," and the English element was well represented, though several of those who shot last season, including Lord Lovat, Capt. Shelley, Mr. S. Hewitt, Mr. W. M. Clarke, Mr. R. Sneyd, Mr. Kennedy, Mr. Marsden Cobb and Mr. H. W. Gilbey, were absent. It is gratifying to know that, if most of the English shot execrably, only two killing 4 birds, one of these two, who had never fired a gun at Monte Carlo, secured the first place after a display of coolness and clean shooting which no veteran could have bettered. The birds were remarkably good, which fact, combined with the assisting breeze, may account for the poor figure cut by all the other English, though the birds were not better or the breeze stronger for them than for the competitors of other nationalities. The consequence was that the contest was over somewhat earlier than usual. No fewer than thirty missed, in the first round, twenty-three in the second, twenty in the third, and ten in the fourth, so that eighty-three of the competitors had to retire thus early, and of the twenty left in nine were Italians. The next two rounds eliminated six more, including Signor Benvenuti, who won the Grand Prix in 1895, and if M. Lostanges was the only failure in the next round, the eighth disposed of five others, including Mr. Vernon Barker. When the latter went out, Mr. Bashford was left the sole representative of England, and he, like M. R. Gourgaud, Count Pfeil, M. Demonts, and Signor Marconcini, kept on killing up to the end of the eleventh round. The twelfth put a different aspect on affairs, for the three last-named all missed, and after M. Gourgaud and Mr. Bashford had both killed their twelfth birds they agreed to an equal division of first and second moneys, though they had to shoot off for the medal. This afforded a very sensational finish, for M. R. Gourgaud, who shot first, had his bird apparently safe with his second barrel; but when the dog went to gather it he made a bad shot, and instead of taking it in his mouth just grazed the feathers, and this gave the bird sufficient force to flutter over the boundary. Mr. Bashford, who is a man of slight build, but with a wiry appearance and a complete command of his nerves, then went up to the mark and grassed his bird as unconcernedly as if he had been shooting in a pool at Hendon, where he is often to be seen. He is a farmer at Barrow Hedges, Carshalton, and has shot frequently at the Union Club, Liverpool, and other places. He was deservedly congratulated upon his initial victory, and it is an improvement, so far as the English are concerned, upon last year, when Mr. Curling, the subsequent winner of the Grand Prix, could not do

better than divide third and fourth moneys, Signor Briasco, who on Friday did not get beyond his second bird, being first. Scores:

Grand Poule d'Essai of £80 and a gold medal, added to a sweepstakes of £4 each; second received £20 and 25 per cent. of the entries; third £12 and 20 per cent.; fourth £8 and 15 per cent.; 26 meters; 103 subs.

The Prix d'Ouverture.

Saturday, Jan. 21.—Another beautiful day—though the sun was not very powerful and the breeze rather strong—favored the second of the big shoots. Some idea of the high quality of the birds may be gathered from the fact that five out of the first six shot at were missed, while in the first round no fewer than forty-five succumbed out of 117. This left seventy-two in the competition, and twenty-eight of these were beaten by their second bird; in fact, only twenty-three remained in at the close of the fourth round. Such good shots as Mr. Bashford (yesterday's winner, who was put out by a puzzling bird in the third round), Signor Guidicini, Mr. Curling, M. Journu, M. Drevon, and M. Moncorgé had all been disposed of, and the twenty-three left in comprised six Englishmen, these being Mr. Witting, who, like Mr. Bashford, had never shot at Monte Carlo until this season; Mr. Roberts, Mr. W. Blake, Mr. Harding Cox, Mr. Robinson and Col. Boswell-Preston, of whom the three last named all failed in the fifth round, which was remarkable for the excellence of its birds, eleven of twenty-three shooters being unable to kill. Mr. Blake was one of the two who missed their sixth birds, and with Mr. Roberts failing in the seventh round, Mr. Witting alone remained to do battle for England against three Italians, two Frenchmen and a Belgian. The last named, M. Lonhienne, was beaten by his eighth bird, and the end was soon reached, for three of the six others missed their ninth birds, and eventually divided fourth money, while M. Verdaveine was put out by a very twisting bird in the tenth round, and had to be content with third prize. Mr. Witting and Signor Tiapi both killed their next two birds in capital style, and the latter was then anxious to divide, but Mr. Witting would not listen to this, and the situation was just the same as in the Poule d'Essai the previous day, for the foreigner shot first and missed what seemed an easy bird, so that Mr. Witting had only to do as Mr. Bashford had done—which he did. He thus annexed the whole of the specie attaching to first place, as well as the medal, and thus two of the English division reached the money-getting stage of these contests, while it is very satisfactory that the first prize should in each case have been won by novices, so far as Monte Carlo is concerned, just as the Grand Prix went last year to Mr. Curling, who had never shot here before. Scores:

Prix d'Ouverture of £120 and a gold medal, added to a sweepstakes of £4 each; second £30 and 25 per cent. of the entries; third £20 and 20 per cent.; fourth £10 and 15 per cent.; 26½ meters; 117 subs.

The Grand Prix du Casino.

Monday, Jan. 23.—The contest for the twenty-eighth anniversary of the Grand Prix du Casino, which was first shot for in 1872, and won by an American, Mr. Lorillard, commenced this morning at 11:30 A. M.; but, with such a large number of shooters, it would be very desirable if an earlier start were made, for it is a matter of chance whether the competition can be concluded in the two days allotted to it, and an adjournment is a very serious matter, owing to the other fixtures, which have already been arranged. It may be taken for granted that pigeon shooting tends to preserve health; for, of the winners of the Grand Prix whose names are given below (twenty-five in number, if allowance be made for the fact that Capt. Aubrey Patton won twice and Signor Guidicini three times), there is not one that has died, to the best of our belief. Still, at any rate, out of the twenty-seven previous winners, eleven (taking into account Signor Guidicini's treble victory) were among the 124 competitors, there being 157 on the board, these being Mr. Cholmondeley Pennell, Mr. Hopwood, Mr. Roberts and Mr. Curling, as representing England; M. Journu, France; and Signor Guidicini, Signor Benvenuti, Signor G. Grasselli, and Count Salina, Italy. Speaking of nationalities, it is very difficult to ascertain to what country some of the shooters belong, for the assumed names are many of them very fanciful, and give no clue to the nationality of the bearer. We do not think, however, that we shall be far from the mark in saying that there were about fifty-two Italians, twenty-eight English, twenty-five French, eight Belgians, five Germans, and three Spanish, while Austria and Hungary had only three representatives, among the absentees being two previous winners in Count Trautmansdorff, who has not missed a year since he won in 1892, and Count Casimir Zichy, Count Gajoli, who won in 1891, was also absent, as was M. de Dordodot, one of the two Belgian victors. Still there was not much to complain of with 124 competitors against 139 last year, and the only question was whether the birds would be up to the very high standard of a twelve-month ago. This they certainly were not, though still above the average; for, while some were very easy, others were practically impossible to kill. The element of luck willed it that the Englishmen should be the principal sufferers, and in the earlier stages Mr. Harding Cox, who appeared to be in capital form, was a marked instance of this. With one exception, his birds came from the extreme right-hand trap, and were all "teasers," and his sixth, apparently well shot, just fell dead beyond the boundary; while as the contest neared its close Mr. Roberts was beaten by two birds of the impossible order, the same holding true of Messrs. Witting, Curling, Barker and Bashford, all of whom had been shooting very steadily. The weather was fine when the shooting began, and the light very good, and only thirty-six failed to kill in the first round, there being a run of 15 kills in the middle of it. But in the second round no fewer than forty-seven failed; and at the close of the third—only three were shot—it was found that forty had accounted for all three birds, while fifty-nine others had killed two out of the three. The forty who had not missed comprised ten Englishmen—Mr. H. Barker, Capt. Stuart, Mr. Cholmondeley Pennell, Mr. Liebert, Mr. Hall, Mr. Beresford, Lord Savile, Mr. Roberts, Mr. Witting, and Mr. Bashford; and the two last named, both newcomers to Monte Carlo, had shot so well that there seemed good reason to hope that they would stay on. There had been so little betting beforehand that it was difficult to say who was favorite; but it would not have been possible to get more than 10 to 1 about Mr. Bashford or Mr. Witting at the close of the day.

Tuesday, Jan. 24.—The morning opened wet and rather windy, and it seemed as if we were in for a bad day, but there was one of those transformations so frequent in this climate, and, if the sun did not shine with its accustomed brilliancy, the rain ceased

and the wind dropped, so that the prospect of a finish being reached before dark was not very bright, especially as the stewards, with fatuous ignorance, called up those who had already missed twice, though it was practically certain that they could not win. Some little time was lost in this way, and it was long before the ranks were cleared to any appreciable extent; and at the end of the fifth round there were nineteen who had killed all their birds, among those who by this time were hopelessly out of the contest being Signor Guidicini and Count Salina, who had missed three of their pigeons. The sixth round extinguished the chances of Mr. Harding Cox, as explained above, while two previous winners of the Grand Prix had cruel luck, Mr. Curling and Mr. Cholmondeley-Pennell's birds both dropping dead into the sea; whereas, upon the other hand, Count O'Brien, who has been shooting very well, was much favored by a bird that did not look like being gathered by the dog. Signor G. Grasselli, another winner of the Grand Prix, was beaten by a twisting bird in this round; and the birds used while it was in progress were generally good, as twenty-one of the fifty-seven shooters missed, leaving at the end only thirteen who had killed six. In the next round out of these thirteen no fewer than five were beaten. To begin with, Mr. Liebert, whose bird did not look to be a very difficult one; Signor Fadini, Signor Lanfranchi, Signor Lucero and M. Eze, who had all four been shooting well for Italy, were among the zeros, though in the case of the two last named their birds dropped just over the boundary. Mr. Roberts too succumbed to a very fast bird, and when the round closed there were left in eight who had killed all their birds, these being M. Moncorgé, Mr. Baker, Mr. Bashford, M. Doris, Count O'Brien, Herr Hans Marsch, M. Bloff and Signor Maino. In the eighth round there was some very fine shooting, Signor Marconcini and Herr Hans Marsch being very effective with their second barrels, while Mr. Bashford was very quick with a bird from the left trap; Signor Maino was, on the other hand, decidedly lucky in having his bird gathered, for it was very nearly over the boundary. The birds were unquestionably good in this round, as little more than half of them were killed, but the only one of the eight who had killed seven that missed was Count O'Brien, who could not have had a more difficult bird. In the ninth round, Mr. Barker, who led off, and shot with great steadiness, had an easy bird from the first trap; but Mr. Blake, who, after having missed his second bird, had been shooting well, let go what seemed to be a very fair chance; but M. Doris and M. Moncorgé gained great applause by the effective way in which they killed their birds from the second trap. Mr. Bashford made a quick kill with his first barrel, and M. Drevon and M. Journu were both shooting so well that those who backed their getting into the ties had, as the result showed, reason on their sides. M. Bloff was the only one of the seven who had killed eight that missed in this round, but he had a very fast bird that he let go clean away.

The tenth round saw a great alteration in the state of affairs, for if Mr. Barker killed smartly from the middle trap with his first barrel, three of the six others, M. Doris, Mr. Bashford and Herr Hans Marsch, failed. The latter missed a very easy bird, but Mr. Bashford seemed not to have got his gun fairly up when a fast bird from the right-hand trap flew straightaway. With M. Moncorgé and Signor Maino both killing in very effective style, they were the only others who had killed all their birds, and it was not fated that either the Italian or the Englishman should last any further, for in the eleventh round Mr. Barker could make no impression upon a very fast bird, while Signor Maino let go one from the left trap, whereas M. Moncorgé had little trouble in disposing of his. The position was much simplified at this stage, for while M. Moncorgé had killed all his eleven birds, seven others—Mr. Barker, Count O'Brien, M. Bloff, M. Drevon, M. Journu, Signor Fadini and Signor Maino—had killed ten out of eleven. It followed that if M. Moncorgé missed his twelfth bird, and the others killed, the whole prize would go into chancery, and there would be a tie among eight. It is easy therefore to understand with what impatience the twelfth round was awaited, especially as the light was at the time beginning to fade, and it became a question whether the end could be reached. The first shot was a miss, Mr. Barker extinguishing the last chance of the English by losing a bird from the fourth trap; but M. Journu and Count O'Brien both killed in workmanlike style. Then M. Moncorgé, who is a small man of rather slight build, stepped up, and favored by an easy bird from the center trap, killed his twelfth, and thus, after having twice been second, secured the Grand Prix. It was a most popular victory, for M. Moncorgé has been shooting at Monte Carlo and elsewhere for many years, and is a very unassuming sort of man. There remained just enough light to get through the ties for second, third and fourth prizes, as of the six who had killed eleven, Count O'Brien and Signor Fadini missed in the first round, while M. Bloff was beaten in the second, the three others—M. Journu, M. Drevon and Signor Maino—then dividing in equal proportions.

It cannot be said that the English did so well as had been expected of them, for Mr. Barker could not get nearer than eighth; but Messrs. Curling, Witting and Bashford shot well, and it is much to Mr. Curling's credit that he should have made such a good show, as he was penalized two meters for his success last year—a success which was certainly not the fluke that the hypercritical would have one believe, for Mr. Curling's general shooting at Monte Carlo bears analysis, and has been most consistent. This leads to the consideration of the question as to the policy of penalizing previous winners of the Grand Prix, seeing what an uncertain thing pigeon shooting is, and it may be argued that if a man is good enough or lucky enough to win the grand prize twice or more, no true sportsman would grudge him his good fortune. There may have been some reason for this restriction when the number of competitors was limited and the average skill much lower; but it seems hard to handicap the veterans like Signor Guidicini, Mr. Cholmondeley Pennell and Mr. Hopwood so severely. But this arises, like many other matters which need alteration, from the system, or rather lack of system, which distinguishes the work of the international committee, which is supposed to manage affairs, but merely serves to make confusion worse confounded. There is such a babel of tongues at the committee meetings that little can be understood of what is said, and the handicapping is a farce, no fixed principle being adhered to. If the performances of an Englishman are being discussed, it is said that, although he has never won anything at Monte Carlo, he is a noted shot in England, so he must be heavily handicapped; whereas, if a Frenchman has made a name in Paris, but has never won at Monte Carlo, he must be let off lightly. There is, moreover, only one Englishman on the committee, as against two or three Frenchmen and Italians. Mr. Harding Cox was the English representative last year during the International Week, and whatever distance he might propose for any of his compatriots, whose form he was quite competent to gauge, was increased by one if not two meters, the consequence being that he was between the devil and the deep sea, being unjustly blamed for harsh handicapping of the English, until at last in despair he rose in the middle of a meeting, and took leave of his colleagues. It is not for a moment to be supposed that any one member of the committee is actuated by any but the highest and most sportsmanlike motives. The fact is, they are each and all gentlemen of position in their respective countries, carefully selected for personal integrity, knowledge and experience of the services required of them; but it is method that is lacking.

Grand Prix du Casino, £800, added to a sweepstakes of £8 each; second received £160 and 25 per cent. of the entries; third, £80 and 25 per cent.; fourth, £40 and 15 per cent.; three pigeons at 26 meters, nine at 27; the winner last year to stand back 2 meters, other winners 1 meter, three misses to put out; 124 subs.

Killed three birds: Marquis de Soragna, M. Lonhienne, M. Poizat, M. Paccard, Signor Riva, Count Piel, Mr. Hopwood, Signor Calari, M. Lostanges, Signor Tiapi, Signor Briasco, Count Dukelman, Signor Gheris, Signor Bighani, Count Filippini, M. Thome, Signor R. Luro, Signor Mangione, Signor Grandi, Jr., M. Verdaveine, M. Issaef, Baron de Mesius, Col. Boswall-Preston, Lord Savile, M. Gourlay, Count du Taillis, Signor J. Grasselli, Mr. Robinson, Mr. Watson.

Killed two birds: Nocca, Guidicini, Salina, A. Ginot, Sani, R. Gourgaud, Vernon Barker, Boswall-Preston, Robinson, De Amcaga, Rogers, Pestile.

Killed one bird: Col. Nixey, de Pape, E. Cremer, Miola, Langhendons, Count Voss, Cramer, Galetti, Ker, Marino, Myring, de Tavernost, Calvaleri, Haydon, Meville, Nicolai, Yardley.

Missed first two or all three birds: Lion, Erskine, Count Esterhazy, Faure, Isacco, Grandi, De Hardegger, Marolli, Pareto.

Ties for second, third and fourth prizes:

M. Journu, divided second, third and fourth of £924.	11-2
M. Drévon, ditto	11-2
Signor Maino, ditto	11-2
M. Bloff	10-1
Count O'Brien	0
Signor Fadini	0

Winners of the Grand Prix since its foundation:

1872, Mr. Lorillard, United States.
1873, Mr. J. Jee, V. C., C. B., English.
1874, Sir W. Call, Bart., English.
1875, Capt. Aubrey Patten, English.
1876, Capt. Aubrey Patton, English.
1877, Mr. W. Arundell Yeo, English.
1878, Mr. Chol. Pennell, English.
1879, Mr. E. R. G. Hopwood, English.
1880, Count M. Esterhazy, Austrian-Hungarian.
1881, M. G. Camauer, Belgian.
1882, Count de St. Quentin, French.
1883, Mr. J. Roberts, English.
1884, Count de Caserta, Italian.
1885, M. L. de Dorlodot, Belgian.
1886, Signor Guidicini, Italian.
1887, Count Salma, Italian.
1888, Mr. C. Seaton, English.
1889, Mr. V. Dicks, English.
1890, Signor Guidicini, Italian.
1891, Count Gajoli, Italian.
1892, Count Trauttmansdorff, Austrian-Hungarian.
1893, Signor Guidicini, Italian.
1894, Count Zichy, Austrian-Hungarian.
1895, Signor Benvenuti, Italian.
1896, M. Journu, French.
1897, Signor G. Grasselli, Italian.
1898, Mr. Curling, English.
1899, M. Moncorgé, French.

Trap at Eltingville.

ELTINGVILLE, S. I., Feb. 10.—Several members of the Jeannette Gun Club and the Columbia Fishing Club arranged a number of live-bird matches, which were decided on the grounds of the Columbia Fishing Club, at Eltingville, S. I., to-day in a strong northeast wind. The ground was covered with about a half-foot of snow. The temperature was 12 degrees below zero. The birds were a good lot. "Johnnie Jones" was the scorer. H. P. Fessenenden was referee.

P. S.—The regular club shoot of the Jeannette Gun Club will be held on the same grounds next Friday, Feb. 17.

Challenge plate, 20 singles and 5 pairs: Gaughen 19, Rasch 11. Jan. 23.—Good birds and Toplit's shooting were the features of the bi-monthly meeting of the New Utrecht Gun Club. The New Utrecht handicap is a 5-bird event, and entitles the member having the most wins during 1899 a free entry, with all expenses paid, in the Grand American Handicap for 1900. The quarterly shoot is a 5-bird event and all stand at 25yds. Handicaps range from scratch to 3 points. Each bird killed counts as one point, and the member having the most points at the end of each quarter receives a merchandise prize, value \$25.

Events:	1 2 3 4 5 6	Events:	1 2 3 4 5 6

* Miss-and-out.
No. 1 was the club shoot; No. 2, 500-shell shoot; No. 3, New Utrecht handicap; No. 4, merchandise prize shoot; Nos. 5 and 6, sweeps.
E. G. Frost, Sec'y.

IN NEW JERSEY.

Bergen County Handicap.

Feb. 8.—This contest of the series of the Bergen county handicap was shot at Midland Park, William Alcott's grounds, to-day. There were eleven competitors. A consignment of birds failed to arrive, so that it was necessary to confine the contest to the number of birds available. The number of birds for each man was reduced to 20. The weather was very cold and snowy. The shooting was done in an open field. The wind was strong in the early part of the race, but was intermittent afterward, changing in direction from 10 to 1 o'clock. The birds were good, but the weather made many sitters. Moffett and Morley retired on 4 misses, with the privilege of continuing if there was a chance to win. They continued, but the referee called the match when darkness supervened. The latter two will finish at the next shoot, on Feb. 15. The scores:

Reid, 27	2220*22202222222222—17
Van Noort, 26	0011222012122222110—16
H. Harms, 29	02112121212102210110—16
H. M. Hefflich, 29	210112212111020122*—16
Fletcher, 26	2022222021122202210—16
Feigenspan, 27	02222112022221111*2—18
Moffett, 28	00022*22122011
Lee, 28	12220122102111010120—15
Wolf, 28	222222212222220202—17
Wright, 29	22*00221122212201000—13
Morley, 31	20*02012212120

Hackensack River Club.

FEB. 7.—The weather was cold and there was snow at the Hackensack Bridge grounds to-day. The wind was about 1 o'clock. The birds were a good lot. The scores made were as follows:

Harris	12112211212222112212102—24
Outwater	222122*2221222211*223222—23
Hefflich	2112222221222122022222*2—23

WESTERN TRAPS.

Paterson—Hicks.

CHICAGO, Ill., Feb. 11.—On last Wednesday, one of the first of the very cold days we have had this week, Mr. A. C. Paterson and Mr. T. P. Hicks met in their second competition for the Chicago trophy, for which Mr. Paterson's challenge had been accepted. The trustees placed both men at 31yds., and gave Mr. Hicks 3 birds, Mr. Paterson having no bird allowance. The weather was stinging and the birds were very healthy. Both men accordingly made very low scores, Mr. Hicks defeating his antagonist by one bird. Score:

Hicks, 31, 3	000102121221210211001101220—19
Paterson, 31	20020201212121212201002—18

Saginaw—Bay City.

On Feb. 5 a good contest occurred between teams from Saginaw, W. S., and Bay City, Mich. Each team had thirteen men, and the visitors were so unlucky as to lose to Saginaw by a narrow margin of 5 birds. Warden Ed. Carpenter was high man, breaking 24 out of the 25 targets. Total, Saginaw team, 231; Bay City team, 226. A return race will be shot at Bay City, Feb. 19. These team shoots are social affairs, with nothing up but the suppers.

Visitors.

Among the several visiting sportsmen who have blown in with the cold wave at Chicago during the past week were Rolla Heikes, now for the Remington and the U. M. C.; Charlie Budd, for the Parker Gun and the U. M. C.; S. A. Tucker, of the Parker Gun; Colonel Courtney, of the Remington Gun, and Fred Quimby, of the Schultz and E. C. Powder. Purely amateur was the visit to this city of Mr. Elmer E. Bliss, of Saginaw, Mich., one of the best shots of this State. Mr. Bliss witnessed with interest the curves of John Watson's birds, but did not tarry beyond one day, for he was on his way to the far-off lands of Arizona and California, where he will spend three months in a region less frigid than this.

Indianapolis.

From a letter just at hand from Mr. H. T. Hearsey, secretary of the Limited Gun Club, of Indianapolis, I would infer that Pop Heikes has been making a tour. Mr. Hearsey says:

"The Limited Gun Club and its members were favored with a call from Mr. Rolla O. Heikes last Thursday. Mr. Heikes showed his Remington gun and U. M. C. shells off to good advantage. Twenty-five fast-flying and select pigeons were trapped, and Mr. Heikes succeeded in killing all of the twenty-five. The birds were a fast lot, and the exhibition was received with cheers by all the members of the club.

"Several target races were engaged in during the day, and Messrs. Beck, Cooper and Tripp assisted Mr. Heikes in making several straight races.

"Our worthy friend and former tournament manager, Mr. Jno. M. Lilly, was unable to shoot on account of a sprained wrist, but his stentorian voice was very much in evidence. In the evening Mr. Heikes was entertained by the club at the Grand Hotel.

"Feb. 22 Mr. Geo. C. Beck and Dr. O. F. Britton will shoot for the Grand Hotel trophy, and the Gun Club will also have a very interesting shoot on that day, several match races having already been arranged."

E. Hough.
1200 Boyce Building, Chicago, Ill.

Interstate Association Rules.

NEW YORK, Feb. 11.—Editor *Forest and Stream*: There seems to be some misunderstanding in regard to the new trap-shooting rules for both live birds and targets which have been issued by the Interstate Association.

These rules are offered by the Interstate Association to the general public with a view to having them adopted universally. They are a thoroughly up to date set of rules, and although they may contain some defects are at present the most perfect set of rules extant.

The misunderstanding referred to above relates more especially to the rule governing caliber and weight of gun. The live-bird rule on this point says:

"No gun of a larger caliber than 10 bore shall be used. Weight of gun unlimited."

This rule, of course, will not be in force in the Grand American Handicap. The Interstate Association's rule in regard to the Grand American being that no gun larger than a 12 bore can be used, and that the weight of the gun is limited to 8lbs. This point will be fully covered in the programme of the Grand American Handicap, that will be printed shortly.

Manager Shaner, in drawing up the rules for the Grand American Handicap, has carefully noted all points where special rules are required for the running of the event. I wish, therefore, that you would call the attention of your readers to the fact that in the Grand American Handicap no gun larger than a 12 bore will be allowed, and that all guns are limited to 8lbs. in weight.

EDWARD BANKS, Sec'y-Treas.

Trap at Burnside, La.

BURNSIDE, La., Feb. 6.—Herewith are the scores of a little live-bird shoot. Mr. Norvin Harris, of Hurstbourn Farm, Ky., and Tom Devine, of Memphis, were present. We expected Mr. Arthur du Bray and Irby Bennett, but neither could come. The birds were a corking good lot of fresh-caught country birds, and a stiff wind blew from the score, that made the shooting very hard to even such good shots as Harris and Devine. The boundary is only a 30yds. one, and a great many birds fell outside, only a few yards out. I wish you could have been with us. Mr. Harris did fine work in the cup match. Some of his kills were beautiful. He had hard luck on his first four birds, then he settled down and did some very steady shooting. His judgment on fast birds was excellent.

Mr. Devine was handicapped, I think, by shooting a 16-gauge gun. With such strong big birds and such a wind the little gun could not be expected to do the execution that the 12-gauge guns did. The birds in the cup race were all blue in color, and they left the traps like a flash. Mr. Harris shot a new Parker with U. M. C. Trap shells and 3½ drams of Du Pont. Devine shot a 16-gauge Greener, 3 drams of Du Pont in Leader shells, and 1oz. of No. 7. Bringier shot a Colt. 3 drams Du Pont in Leader's shells. Miles shot a trap Winchester, 48 grains Schultze in Leader shells.

	No. 1.	No. 2.	No. 3.

Gasolene Engine and Launches.

BY F. K. GRAIN.

I.

IN the following articles it is not proposed to attempt to enter into minute details of the theory of motors, boats and other parts, but rather to give the average owner or would-be purchaser a clear, general idea of the subject, together with instructions and wrinkles derived from personal experience covering a period of some fifteen years.

All technical terms have been dropped as far as possible. Although there are, as will be noted later on, other motors of note, they are each in a class by themselves, and these papers are therefore confined to the internal combustion or gasolene motor, it being the most common type, and without question the one that in the near future is destined to supplant all engines for launches having the power exerted on a piston.

MOTORS.—The internal combustion motor, or what is better known as the gasolene engine, is fast becoming very popular with launch owners. The up-to-date motors cannot be set on fire or exploded by the most ignorant handling, and are all very economical in consumption of fuel.

TYPES.—These motors are divided into two classes, viz., those having an impulse of the piston by the expanding gas every second revolution, and known as the *Otto* or *four cycle*, and those having an impulse every revolution, known as the *Day* or *two cycle* motor.

Each of these types has, among makers and users, its claimants for superiority, but personally the writer after equal experience in the use of both cannot see that in either economy or ease of handling, durability or simplicity, there is any choice.

FOUR CYCLE.—We will first take up the four cycle system. In these motors the first downward stroke of the piston acting as an air pump draws into the cylinder a charge of gas, then on the return or up stroke it is compressed in the top of cylinder, or what is known as the clearance space, to about three to five atmospheres, or 45 to 75 lbs. pressure, and just before reaching the upper end of stroke ignited by means of either a red-hot tube or an electric spark, when the gas expands and drives the piston down. Just before reaching the end of the downward stroke the exhaust port is opened, allowing the burnt gases to escape. The exhaust port then remains open during the next up stroke in order that the pressure of the rising piston will entirely clear the cylinder of all remaining gases, the exhaust port now closes and the piston descends, drawing in a new charge of gas.

With these motors the firing device, pumps, valves, etc., are all worked from a time shaft by means of gear wheels on the main shaft, thus imparting a full working stroke to these parts only on every other revolution of the motor. In order to impart a steady motion to the motor during the idle stroke, the fly-wheel requires to be of great weight and diameter.

TWO CYCLE.—The two cycle or Day motor obtains an impulse of the piston each revolution. All motors of this type now in successful use have what is known as a compression crank pit, that is to say, the part of the motor forming the lower frame crank chamber and main bearing is an air-tight chamber, opening into the cylinder on top; therefore when the piston is on its up stroke a charge of gas is drawn into this chamber through a self-acting valve; then, on the piston descending, the gas is slightly compressed, being thereby forced through a port opened by the ascending piston and ignited at the proper time. The exhaust gases are expelled through an exhaust port opened by the piston near the end of its stroke. In order to cleanse the cylinder of all burnt gas, the inlet is generally timed to open a little before the closing of the exhaust port in order that the fresh gas will expel the burnt gas.

These motors are claimed to be wasteful on account of a part of the unused gas escaping with the exhausted gas, this we will discuss later on.

This motor requires less fly-wheel, owing to its getting an impulse of the piston each revolution, and run with less vibration than the four cycle motor.

IGNITION.—There are three methods of igniting the gas in the cylinder, by a hot tube, electric spark, and what are known as self-igniters.

HOT TUBES.—The hot tube ignition is by means of a hollow tube with a closed end, projecting into the top of cylinder. A small flame from a gasolene torch, kept constantly burning, is projected into this tube, heating it sufficiently to ignite the charge when compressed. This method of ignition has been almost entirely superseded in marine motors by the electric igniters. The difficulties with the hot tube are liability of the lamp blowing out, the time required to heat up the tube at the start (five to ten minutes), and as the tubes burn out they have to be renewed; last, but not least, it is very difficult to time the exact moment of ignition, as any variation in length, thickness or in the composition of the metal from which the tubes are made will cause any particular tube taken from the same lot to fire either in advance or later than the one previously in use. It also requires considerable gasolene to heat the tube. The advantages of the hot tube are that it is not so complicated as the electric battery, and if the tube is not burnt out and the torch kept going is sure to work.

ELECTRIC SPARK.—The electric igniter is in use by nine-tenths of the present gasolene motors, and is fast being

brought to a state of perfection that a few years ago was thought to be impossible. Although there are no two motor builders using the same designed device as a sparker, they are all made on two principles. The first is what is known as a *wipe spark*; this is an electrode projecting into the cylinder; the usual way is to make a flexible end something like a flat spring attached to or a part of a rocker shaft, with an arm, dog or toothed wheel running through a stuffing box gland or removable bearing into the cylinder, so that when motion is imparted to this shaft it will cause the two parts to come together and then separate with a wiping motion, the spark being made at the time of separation. These parts are usually made so that the working part is free to charge from the entire iron work. The other, which is usually called the electrode, has a direct connected wire and is insulated by means of mica rings or washers, so that it gets no current from the motor. This method has the advantage of making a very large and strong spark, but owing to the constant wear of the sparking surface requires a great deal of attention to keep it in time. It is not adapted to motors of very high speed, as increase of speed diminishes the volume of spark, consequently those using this system of sparking, although being good, easy and sure starters, are apt to fail or skip impulses when speeded up.

The next mode of sparking is made by having an electrode as on the preceding device, but in place of the wiping motion there is a small arm or rocker shaft which touches the electrode and is then separated by the quick action of a spring; it is like the action of a hammer dropped lightly on the head of a nail, and then lifted off quickly; for this reason it is generally called the *hammer sparker*. The disadvantage of this is that the spark is small, and although very economical, it requires more battery power than the wipe spark in order to always keep it up to its full capacity. It has the advantages, however, of requiring very little, if any, adjustment, and makes the same volume of spark at all speeds.

BODY PLAN OF KNOCKABOUT.

SELF-IGNITERS.—The self-igniters are a means of igniting the gas by the heat generated in the motor. They consist mainly of a certain metal projection in the cylinder, made from some composition that is heated by the burning gases, and which retains sufficient heat to ignite the charges from stroke to stroke.

None of these igniters will work until after the motor has been at work a sufficient time to get thoroughly heated, therefore it is necessary to have other means to start the motor. There are a number on the market, but we have not as yet seen any that we could recommend as being either reliable or advantageous.

GAS GENERATORS.—The ways of generating gas from gasolene for use in motors are numerous, but the two mostly in use are: First, the vaporizers, which, although made in many different forms, are to all practical purposes the same.

VAPORIZERS.—The general principle is a small vessel, some only the size of an egg, having a self-acting valve which, on the engine making suction, opens, allowing a charge of air to enter, and at the same time a small quantity of gasolene through another opening. The air vaporizes the gasolene and it is then drawn into the cylinder or compression chamber of the motor, as the case may be. On some there is a fixed amount of gasolene used, and in order to make the right mixture the air inlet is gauged by means of an air valve; in others the air supply is fixed, and the gasolene gauged. We think the latter by far the best and most economical. The above generators or vaporizers are fast superseding all others, as they are compact, free from danger, will use almost any grade of gasolene, and are not so sensitive to atmospheric changes.

CARBURETORS.—Carburetors were among the first gas making devices used on gasolene motors, and are still in use by a number of builders. They consist of a tank of varying size, having in some cases a dome on top, from which the gas is drawn to the motor. The generation of the gas is produced by having a pipe through which the air is drawn, projecting below the surface of the level of the gasolene; thus when the air is drawn from the dome above the gasolene a partial vacuum is formed, causing the air to come in through the air pipe, and rising up through the gasolene, thereby charging the air with the vapor. As the vapor thus produced is not exactly of the right quality, it in most cases has to be

diluted more or less by admitting more air through an adjustable air cock, either directly into the engine or between it and the carburetor.

This generator is cumbersome, requires cleaning, owing to deposits of thick oils, and in most cases will only use successfully special grades of gasolene. Unless there is an intermediate valve between the carburetor and the motor it is liable to explode or get on fire through a fire back from the motor, which is caused by something getting under the seat of the inlet valve, or through defects in design and construction.

PUMP GENERATOR.—There is still another generating system used on a few motors, though it has been discarded to a great extent; but which, if it were possible to overcome its defects, would make an ideal method of feeding gasolene. It consists of a small plunger pump, worked from a rocker shaft or by other means, which throws or injects a small spray or drop of gasolene directly into the inlet port of the motor. The quantity of gasolene is regulated in most cases by a very clever means, which varies the stroke of the pump plunger at the will of the operator, thereby governing the amount of gasolene as required. This plan has the advantages of simplicity, safety and also that the gasolene tanks can be placed in any position, not having to depend on gravitation to secure the flow of oil. As for vaporizers or carburetors, which require a gravity feed, unfortunately all pumps, owing to various causes, especially in the small sizes, will at times *over* or *under pump*, in other words they fail to supply a uniform amount, which is fatal to the successful working of the motor.

[TO BE CONTINUED.]

A Fast Cruising Knockabout.

THE yacht here illustrated through the courtesy of the designer, Mr. W. B. Stearns, of the Marblehead Yacht Yard, is built to the dimensions and scantling of the Boston Knockabout Association, and is fully fitted for cruising; at the same time she will be raced in the handicap knockabout class at Marblehead. This class has been very successful during the past two seasons under the patronage of the Corinthian and the Burgess yacht clubs, and although the yachts which race in it represent a decidedly less extreme development of racing features than the raceabout, and are much nearer to the original idea on which the knockabout class was founded, they are at the same time very smart little craft for their length. Not only do they furnish good racing under the limitations of the class, but they are quite fast. The yacht is building for Messrs. E. I. and W. L. Cropley, of Marblehead. Her dimensions and elements are:

Length—	
Over all	33ft.
L.W.L.	21ft.
Beam—	
Extreme	7ft. 8in.
L.W.L.	7ft. 2in.
Draft	5ft.
Freeboard, least	1ft. 9in.
Girth, midship section	14ft.
Displacement	6,700lbs.
Ballast, lead keel	3,600lbs.
Midship section, area	9.5 sq. ft.
Lateral plane, area	52.9 sq. ft.
L.W.L. plane, area	111 sq. ft.
Block coefficient	0.14 sq. ft.
Prismatic coefficient	0.50 sq. ft.
Sail area—	
Knockabout rig	500 sq. ft.
Raceabout rig	600 sq. ft.

The sail and interior plans will appear next week.

The Question of Overhangs.

THE following interesting letter from Mr. Linton Hope appeared in a recent issue of *The Field*. Mr. Hope has summed up the matter very fairly, and we quite agree with him as to the great value of overhangs in any vessel except where they are severely taxed, as by over-all measurement:

I trust you will pardon me for reopening the discussion on the value of overhangs for seaworthiness; but the following facts may help to convert some of the adherents of the old type to the use of moderate overhangs:

I think it may be taken for granted that sea-going smacks are built under the three following conditions:

- (1) The most seaworthy vessel that can be built for the price.
- (2) The easiest vessel to work with a small crew in bad weather.
- (3) The fastest type that will combine the first two conditions.

These three requirements, I take it, are exactly those of a cruising yacht, so the type suitable for one should suit the other to a great extent.

Every one will probably admit that the fisherman is the most conservative of all that conservative race, the British sailor, and that there must be a very strong reason for him to change the type of craft in which he has been brought up; so, when smacks are being built with considerable overhang in various parts of the country, there must be some very strong reason for such an innovation.

The first smack I saw with a modern spoon bow and long counter was cruising about the Solent a couple of years ago, having been let as a yacht for the summer, and at the time I thought she was merely a yacht which was used occasionally for fishing, as many are.

Since then I have seen several large North Sea smacks in Ramsgate of the same type, and a second and larger one in the Solent last year, from Brixham, I believe. All these vessels were highly spoken of by their crews as able sea boats, and much handier and faster than the old type, with straight stems and short, steep counters.

Within the last few weeks I received an order from a well-known smack-owner and builder in South Wales for a ketch smack of twenty tons register for long line fishing. He ordered a boat with a spoon bow and plenty of overhang, as a Brixham smack of this type had lately come to that part of the coast, and was a far better boat than the local straight-stemmed smacks, and always first in with her catch, spoiling the market for the slower

KNOCKABOUT, DESIGNED AND BUILT FOR MESSRS. E. I. & W. L. CROPLEY, BY W. B. STEARNS, 1899.

boats, besides being a better sea boat and easier to handle, owing to her greater deck room and shorter bowsprit.

I have designed a somewhat similar vessel to the *Blonde*, fourteen tons (illustrated in the last edition of "Yacht Architecture"), but with slightly hollower garboards and more beam in proportion, and more forward overhang. The following are some of the dimensions: Length over all, 58.4ft.; waterline, 41.5ft.; beam, 13.5ft.; and draft, 7.5ft. She is about thirty-five tons Thames measurement, and twenty tons register.

It is surely fairly conclusive, when a smack owner says he must have a spoon bow, that it is something more than just following the fashion; and he is probably far better able to judge as to the best sea-going type than most yachtsmen, who do not, as a rule, keep the sea during the winter, as a smack has to do.

I may also remind your readers that one of the first yachts with an overhanging bow was designed by one of the largest smack owners in England, and raced by him with such success that she fairly swept the ten-ton class. I refer to *Buttercup*, designed and built by Mr. Robert Hewett, the commodore of the Royal Corinthian Y. C.

This gentleman has also had a thirty-ton T. M. cruiser, designed by me, of very similar type to the smack described above, but with the hollow profile forward under water, now in use in both cruisers and racers, and less beam, and more depth in proportion to length. So far as my own personal experience goes in small cruisers, I have no hesitation in saying that there is no comparison between a boat with fair overhangs and one with a straight stem, when it comes to really heavy seas. With a properly canvased boat of the modern type you can drown out a boat of the old style of twice the size. In saying this, I am going upon actual passages I have made in boats of both sorts.

One of my first cruisers was the *Haze*, a big displacement boat of 20ft. over all, 7ft. 9in. beam, and about four and one-half tons displacement, with two and a quarter tons of lead, one and a quarter tons being on the keel. (See "Yacht and Boat Sailing," last edition.) She was a better sea boat than any of the other small cruisers I met, and fairly fast, and on one occasion made a passage from Shoreham to the Thames in very heavy weather. But she was nowhere as a sea boat with my last cruiser, *Induna*—a boat one-fourth her displacement, 26ft. over all, only 5ft. 6in. beam, and 2ft. 8in. draft, with 15cwt. of lead on her keel. She was easily driven with 260 sq. ft. sail area, while *Haze* was badly under canvased with 500 sq. ft. *Induna* was 19ft. waterline, while *Haze* was 20ft. as altered 1887; but *Induna* could have drowned *Haze* in a sea. I took her round the South Foreland in the teeth of a hard southwester into Dover, when it was so bad that a lot of yachts of twenty to thirty tons would not leave the Downs, and even big craft of sixty and eighty tons were running back into Dover under headsails rather than go round Dungeness.

Though the seas were heavy, breaking over the bows of a sea-going brigantine of some 300 or 400 tons, which was close to me, half way up her fore course, *Induna* made capital weather of it, standing off from Deal to the South Sand Head Lightship in the worst of the sea; then, staying as easily as if she were in the Thames, she fetched well to windward of the Foreland, and beat the brigantine half a mile dead to windward in the one tack, having started dead to leeward, and crossed her bows, and when I came about again under the land near Dover she was nearly out of sight in the big sea.

It is said by many that the modern boat with no forefoot will not heave to, but on this and many other occasions (when I have been single-handed) I have her to for some time, the sea about as bad as it could well be for such a small boat; but she lay perfectly quiet, slightly head reaching, under a scrap of foresail with sheets flat amidships, and a three-reefed mainsail with the sheet eased off a bit. Most of the time I was astride of the stem passing preventer lashings on the roller foresail, as the tack was chafed, and even in that sea she never put her head fairly under, though, of course, seas broke constantly all over me.

In conclusion, I can only say that if I were going to build a cruiser to-morrow, for a hard-weather craft to keep the sea, I would give her a cutaway fore-foot and a good overhang, so as to have a roomy, dry deck, and a boat that would always keep on top of the seas and not go in up to her mast, nearly smashing her bowsprit every time she takes a dive.

LINTON HOPE.

The First Voyage of Zulu.—II.

WE were still a long way from Lake Erie, but luck was with us, and a pleasant breeze sprang up from the north. So we rigged out the spinnaker boom and got the sail on her, and glided along comfortably for many a mile, bothered only by the numerous bridges, which obstinately refused to swing until we were close up to them, and then, just as we lowered away, we would see a man run out from a little cabin and turn a crank, and then slowly the bridge would swing aside and *Zulu* would squeeze through, with a foot or two to spare. The breeze came fresher and fresher, until it began to blow a brisk summer gale, and in one of these anxious moments, when it seemed as if a crash were unavoidable, the spinnaker halyards were let go by the run, the boom dropped into the water and broke short off against the shrouds—a bad business, but the only mishap which marred the trip. The spinnaker being useless, and the mainsail too heavy for such lively work among the bridges, we had recourse to the mizen for the remainder of the run, and found it, as I have before, a wonderfully good sail for running in strong winds. Being nearly in the center of the boat amidship, there is little tendency to luff into it unless the tiller is put down, and the steersman's view is entirely unobstructed; and when the tiller is put down the boat flies into the wind like a top almost in her own length.

After a short stop in Welland we again got under way, and after seven or eight miles more sailing we suddenly rounded a sharp bend, and close ahead of us was the village of Port Colborne, and out between the piers we could just catch a glimpse of Lake Erie itself.

It was 6 o'clock by the time we got through the guard lock, and every one, from skipper to cabin boy, was thoroughly tired out with our thirty-six-hour run. So, though

the night was fine, we tied up, and after a hearty meal turned in early and never woke until 7 A. M. next day. After a run up to the telegraph office, we at once got sail on her, and with a light air in our faces, stood out of the canal on the final ninety-mile stretch of our voyage. Once fairly outside the air became a light breeze, and by 10 o'clock the breeze had freshened to a gale and needed a double-reefed mainsail, and yet *Zulu* was logging off a good seven miles per hour, with sheets well started to port. The sea began to get up as we came abreast of the Mohawk Light, and increased so fast that we hauled up a little so as to keep the weather shore until we could see what was going to come; but toward 3 o'clock in the afternoon it began to take off a little, and the course was laid for Long Point, distant about twenty miles. The gale subsided almost as quickly as it had risen, and by 6 o'clock we were becalmed, with barely steerage way, and Long Point Light still five miles away. With sundown came a light air from the north, and the spinnaker boom was fished and got out to starboard, and as the waves rose at 9 o'clock, we glided past the great revolving light and were soon in the track of the Buffalo fleet. Two of our hands turned in, while the third remained on deck to keep a lookout. Several steamers passed us at a good distance, and finally a pair of eyes, red and green, appeared bearing directly down upon us from the east.

ZULU.

Designed and Built by H. K. Wicksteed, 1898.

The hand showed a light on the quarter, and the big steamer shifted her helm and slid by astern, but so close that we could hear the breathing and thumping of the engines. Meanwhile the breeze had freshened and a big swell was rolling up from the northeast and increasing every moment. Sail was reduced to whole mainsail, and being clear of the track of commerce now the watch was sent below and the skipper was left alone with the night. That was a glorious midnight sail, the boat reeling and swaying along on the broad-backed swell, with the main boom swung away off to starboard, the moon glowing large and red on the edge of a fog bank to the southeast, and the lights of Erie showing ahead, first as a dull glow reflected from the sky, and then as a glow with one or two bright points showing, and finally as a myriad of needle points of bright light as we lifted them higher and higher.

Meanwhile, fresher and fresher came the wind, until the mainsail became almost too much for the boat; but the lights were close ahead now, and the mast was of tough spruce, and the backstays of $\frac{1}{4}$ in. steel wire, and the skipper concluded to hang on till the last moment. The watch was called on deck again, and as Presque Isle Light swung out from the rest on the starboard beam a bright lookout was kept for the gas buoy at the entrance to the channel. The lookout picked it out by its motion a good half mile away, no bad feat for a new hand among the bewildering maze of electric lights, and squaring away round it, we raced off before the wind for the pier head amid a roaring of wind and waves. In a few moments the great stone tower was far up over the crosstrees, and in another minute *Zulu* was running quietly in between the piers. Ten minutes more and we were in the smooth water of the harbor and hunting for a berth. The moon hung low over the land now, leaving all the ships in shadow, and a red light, kindly and thoughtfully hung out to guide us at the club house, was regarded with suspicion and distrust, but we found a berth at last, and just as day began to break we turned in for a well-earned sleep into the cozy cabin, well pleased that we had accomplished the trip without mishap, except as before mentioned.

With the exception of the exasperating and protracted calm off Toronto, we had been moving steadily along, and had tested the boat in all weather and on all points of sailing, and I think the main regret of the whole ship's company was that we had not further to go—that is, on the lake. Every one was satisfied with the amount of canaling.

Next day, or rather the same day, after it had developed a little and the crew turned out after a sleep, was Sunday, and we had barely time to get things in order before the owner appeared on shore, and we formally turned the ship over to him. A little later we got sail on her and made a trial spin around the bay. Still blowing hard from the northeast and *Zulu* under mizen, stay-sail and close-reefed mainsail, had all she could manage, but we continued to keep ahead of a big schooner-rigged fishing boat which was tossing about under full sail, with a dozen men on her weather gunwale, and were well

pleased with the boat's speed and weatherliness, though she seemed to be at her best in light air.

The afternoon was enjoyably spent about the club house and the city. Erie boasts quite a fine yacht club, with quite a number of boats and a goodly number of sailors of the proper stamp. Unfortunately, the boats, although quite numerous, are somewhat ill-assorted as to size, making regular racing of a satisfactory kind very difficult; but the club is young, and as it grows older and settles on the type best suited to the locality, the old boats will be discarded and a more uniform lot will take their places.

Except in the matter of coal, smoke and dust the site is almost an ideal one, with a harbor similar to but larger than that of Toronto, and affording plenty of room for racing inside with the small fry, while making an excellent base for short cruises about the lake. At all events, the crew of the *Zulu* were much pleased with the place and with the yachtsmen, and it was with regret that they parted with their kind host and boarded the train for Buffalo, Niagara Falls and home.

HENRY K. WICKSTEED.

YACHTING NEWS NOTES.

The annual meeting of the Royal Kennebecasis Yacht Club of St. John, N. B., was held on Feb. 7, the following officers being elected: Com., Edgar H. Fairweather; Vice-Com., Fred. S. Heans; Rear-Com., Howard Holder; Sec'y, F. Herbert J. Ruel; Treas., Robert Jardine; Measurers, C. F. Langan, William Holder; Executive Committee, George B. Hegan, Arthur Kirkpatrick, J. N. Sutherland, G. E. Holder and A. P. Macintyre; Sailing Committee, W. G. Stratton, P. Sinclair, A. McArthur, Sydney L. Kerr, E. Harrington and Lewis Munroe. The Secretary's report showed that the last season, the fifth of its existence, had been the most prosperous in the history of the club. The membership has doubled during the year, while the fleet has increased in number from twenty-two to thirty-three. The racing season proved very successful, several handsome cups and a silver shield being presented to the club by members and by interested citizens, while the annual cruise some 100 miles up the River St. John, and lasting ten days, drew out twenty-five of the fleet. During the year the club petitioned Her Majesty, the Queen, for the privilege of using the prefix "Royal," which petition Her Majesty was graciously pleased to grant. The outlook for the coming season is most encouraging to all lovers of this greatest of all sports, and before its close it is probable that both in membership and in fleet St. John will possess a club even more than at present worthy of representing one of the great winter ports of the Dominion of Canada.

One of the recent additions to the extensive series of technical catechisms published by J. J. Weber, Leipsic, is the *Illustrated Catechism of Rowing and Sailing Sport*, by Otto Gusti. This little work, which is in German, covers in compact form the kindred sports, the portion on rowing treating of boats, the stroke, the crew, training, racing, rowing, cruises, etc. The second portion of the book deals with sailing, treating briefly of the design and lines, types, the yacht and her gear, cruising, navigation, etc. A special chapter is devoted to ice yachts. The book is well written and quite modern in its ideas, and it is well adapted to the wants of the tyro and the young amateur. It is illustrated by numerous diagrams and a chart of the German and Austrian rivers, with the locations of the different rowing and sailing clubs plotted.

Messrs. Longmans, Green & Co., New York, announce a new book on Naval Architecture, devoted to the laying off of iron, steel and composite vessels, by Thos. H. Watson, lecturer on naval architecture at the Durham College of Science, Newcastle-upon-Tyne.

Canoeing.

War Canoes at the Meet.

THE Northern Division men are at work this winter training for war canoe races at the A. C. A. meet, the Toronto, Kingston, Brockville and Ottawa clubs being interested. It is probable that the Central, Eastern and Atlantic divisions will be represented by crews from Rochester, Boston, Auburndale, New York and Trenton. The new Western Division is looking for an active season and a return of the old-time interest in canoeing; a war canoe crew from this division at the general meet would make matters still more exciting. One firm of Canadian builders reports orders for seven 30ft. war canoes and a larger inquiry for canoes of all kinds, sailing and paddling, than is usual at this time of year.

PUBLISHERS' DEPARTMENT.

FLORIDA.

Personally Conducted Tour via Pennsylvania Railroad.

THE Pennsylvania Railroad Company's third tour of the present season to Jacksonville, allowing two weeks in Florida, will leave New York and Philadelphia by special train of Pullman Palace Cars Tuesday, Feb. 21. Excursion tickets, including railway transportation, Pullman accommodations (one berth), and meals en route in both directions while traveling on the special train, will be sold at the following rates: New York, \$50.00; Philadelphia, \$48.00; Canandaigua, \$52.85; Erie, \$54.85; Wilkes-Barre, \$50.35; Pittsburgh, \$53.00; and at proportionate rates from other points.

For tickets, itineraries, and full information, apply to ticket agents; Tourist Agent, 1196 Broadway, New York; 789 Broad street, Newark, N. J.; or address Geo. W. Boyd, Assistant General Passenger Agent, Broad Street Station, Philadelphia.

Mr. W. J. Cummins, of Bishop Auckland, England, maker of superior salmon and trout rods, flies, reels, lines, etc., writes us that he will be glad to send his catalogue to any of our fishing friends who may wish to receive one. He adds: "I have been an advertiser in your journal for some time, and intend to continue so, and have now an increasing trade with your readers." Mr. Cummins' advertisement is found on another page of *FOREST AND STREAM*.

With the appearance of the index of each volume of *FOREST AND STREAM*, many subscribers wish to bind up the volume, and look about for a competent binder. Attention is called to the advertisement in another column of Mr. Chas. F. Brockel, of Danbury, Conn., bookbinder, who invites correspondence on this subject. *Adv.*

To the man who goes out simply for the purpose of filling the bag, a blank day is a blank day, and his visage and demeanor show it; but to the observant naturalist-sportsman an empty bag at the end of a long and tiring day will be no criterion as to his feeling, for he may tramp home with heart far lighter than his bag even, and record an entry in his diary or memory which will be reverted to in after years with much pleasure.

HENRY SHARP.

THE ELK IN CANADA.

MUCH interest has been excited by the report made last month of the killing in the Province of Quebec of a wapiti, the great elk of Canada. This species has been extinct in the East so far as known for many years, though formerly abundant along the Atlantic Coast, at least from Virginia to Canada. One of the last localities where it existed was in the rough mountains of Pennsylvania, but for many years there has been no evidence of its occurrence in the East further than the occasional finding of some of its bones or a decayed antler or two. It is said that there is no authentic record of the occurrence of the elk in eastern Canada for the last thirty years.

Up to about 1875 there were believed to be a few elk left in the dense forests of Michigan, and still later they inhabited the Roseau Swamp in Canada, near the borders of Minnesota. These survivors were probably long since exterminated, and the elk is now confined to the Rocky Mountain region and westward. On the other hand, in many preserves in the wilder portions of New Hampshire, New York and elsewhere the Western elk have been reintroduced and have done remarkably well.

The elk recently reported to have been killed in the Province of Quebec was taken on the Casupscull River, a branch of the Metapedia, not very far from the head of the Bay of Chaleurs. It is said to be a true elk, and its skin has been sent to a Boston taxidermist to be mounted, and the specimen will be shown at the sportsmen's exhibition in New York next month.

Confirming this capture is the statement by Count H. de Puyjalon, of the Department of Lands, Forests and Fisheries, Quebec, who, in his report on the region of western Quebec, published in 1896, states that on more than one occasion he has found unmistakable elk tracks in that country. Moreover, in a private letter to FOREST AND STREAM on the same subject he says: "I may add that I saw, though from a long distance, the two wapiti (*Cervus canadensis*) whose tracks I then followed. There can be no doubt with reference to the species of these two animals. Both unquestionably were the great Canadian stag." He adds: "Moreover, that animal formerly existed in large numbers in our western country, and it seems to be possible to admit that the exceptional climatic condition enjoyed by those regions since 1890 may have contributed to bring back a certain number of great stags to their original habitat." Of the occurrence of the elk said to have been killed on the Casupscull River the Count de Puyjalon has no personal knowledge. "Nevertheless," he writes, "I may say that in our sparsely inhabited country, covered with almost continuous forests, some kinds of animals may sometimes be found very far from their usual habitat, without its being possible to explain in a very rational manner the causes of a dispersion as unusual as it is unexpected."

The matter here brought up will be keenly scrutinized by naturalists. The locality of this capture is within the original range of the elk, but one from which it has long been believed to be exterminated. Only two explanations of its occurrence are possible. Either it is a reintroduced animal, or it is a survivor of the ancient herd which roamed the Province of Quebec. It is hardly to be imagined that this last is true; for if the elk had been living in the Province of Quebec for thirty years without their presence being known they would by this time have become numerous, and among the many hunters who each season travel through these forests some would have seen and reported them long ago.

On general principles, it would seem much more likely that the particular specimen in question was an estray from some preserve or park, possibly in New Hampshire, possibly in New York. It is true that the distance from any such known park to the waters of the Metapedia is great; but, on the other hand, elk are known to wander far. It is well understood that in these great preserves of the northern United States trees are constantly falling on the fences and breaking them down,

and nothing is more likely than that from time to time elk escape through breaches made in this and other ways.

While it is conceivable that elk may still exist in Quebec, it is highly improbable, and naturalists will demand evidence of a positive character before accepting this statement.

We recall a few years ago the report current for a long time in the Adirondacks that a caribou or an elk had been killed there a few years before. A careful investigation of the facts by the FOREST AND STREAM showed that instead of being an elk or a caribou, the specimen in question was a European red deer, which had been killed there a few years before. A careful in the Adirondacks. It was reported two or three years ago that a number of red deer had been turned out on the Island of Anticosti by M. Menier. It is possible that one or more of these may have in some manner escaped.

THE BIRD OF WASHINGTON.

No American who ever lived has been so honored as Washington in lofty monument, in statuary of marble and bronze, and in the bestowal of his name upon State and city and county and town. From the time when Washington took command of the American army down to this present moment the name has been first in war, first in peace and first in the hearts of his countrymen; and they have used it for all manner of purposes—Washington Masonic lodges, volunteer fire companies, schools and colleges, prize cattle, baseball clubs, steamboats, militia companies, lozenges, negro slaves, and brands of flour, and Washingtonian societies of reformed drunkards. Considering this proclivity, then, it was not surprising that when the naturalist Audubon, while voyaging on the upper Mississippi, beheld in the distance a bird of majestic flight, then first seen by him, and thought to be new to science, he should have chosen for it the name of Washington. This first bird he did not succeed in capturing, but in after years, in Kentucky, the longing he had cherished was gratified by the capture of a specimen, which he describes in the first volume of the Ornithological Biography. Of the name and the impulse which prompted him to bestow it, he records:

The name which I have chosen for this new species of eagle, the Bird of Washington, may, by some, be considered as preposterous and unfit; but, as it is indisputably the noblest bird of its genus that has yet been discovered in the United States, I trust I shall be allowed to honor it with the name of one yet nobler, who was the saviour of his country, and whose name will ever be dear to it. To those who may be curious to know my reasons, I can only say, that, as the new world gave me birth and liberty, the great man who insured its independence is next my heart. He had a nobility of mind, and a generosity of soul, such as are seldom possessed. He was brave, so is the eagle; like it, too, he was the terror of his foes; and his fame, extending from pole to pole, resembles the majestic soarings of the mightiest of the feathered tribe. If America has reason to be proud of her Washington, so has she to be proud of her Great Eagle.

And what was this noble "Bird of Washington," named in honor of "one yet nobler?" Modern authorities make it the young of the white-headed sea eagle, or bald eagle; and if we turn to Coues, we find the "Bird of Washington"—for all its high-sounding name, and as if in flouting of Audubon's patriotic enthusiasm—summarily characterized as "piscivorous, a piratical parasite of the osprey, otherwise notorious as the emblem of the republic." Alas! for this age of iconoclasm and irreverence.

GETTING AWAY FROM IT.

In a crowded New York street car the other day a doctor and a restaurant cook got into a quarrel because the doctor thought the cook ought to move a bundle to make room for a woman to sit down; and in the affray which ensued the doctor drew a revolver and shot the cook. When we consider the nervous strain to which city people are subjected in the congested street car traffic which makes up so much of their daily experience, the marvel is not that this doctor shot the cook, but that personal conflicts are not of everyday occurrence. That people permit themselves to be shoved and pushed and wrenched and squeezed and jammed and gouged and poked and walked on and twisted and compressed and pulled out and doubled up and bent back and sat upon, and with it all utter no protest, manifest no resentment, take not the law into their own hands, but meekly turn the other cheek, this is both a tribute to the inherent and

all-triumphant amiability of the average man and woman, and an indication of a rule of conduct based upon a philosophy learned by experience, which teaches that it is after all wiser to endure in silence, to bite the lip in self-repression, to crowd down and stifle the impulse to assert one's rights, and so to suffer and see others suffer without protest or resentment. For in ninety-nine cases out of one hundred, if one permits himself to digress from this rule of conduct he surely flies from ills he has to those he knows not of, nor ever dreamed of, until he finds himself the center of a street car scrimmage. If under all circumstances it is utterly impossible to keep one's temper, the wise man at least makes effort not to betray that his temper and he have parted company. This is the rule of conduct deliberately adopted by people who want to get to their business in the morning and to their homes at night in a tolerably equable state of mind.

And one consideration, which is potent and comforting with those who are so favored as to benefit by it, is that some of these blessed days, when the trout are rising and the birds are singing by the brooks, there will be a getting away from it all. For in the midst of "the push" there comes to one visions of green fields and flowing streams, and the quiet and content and peace of nature; and in fancy beholding such scenes, in fond anticipation promising for himself a fishing trip, he may well forget the annoyance of the present in the contemplation of the future. There is no theory nor speculation about this. The fishing one has had and the fishing he looks forward to are not of the past and of the future only, but of the present as well.

Some people wonder why men are anglers, and what there can be in the catching of trout or bass, that your fisherman should be so bent on going fishing. Well, one explanation is that a fishing trip means getting away from the turmoil and vexation of the street cars.

SNAP SHOTS.

From many parts of the country comes word of the effect of the great storm upon the game birds. The most astonishing phenomenon of the storm was its severity in the far South. The residents of the northern part of Florida were treated to the sight of a snow-covered landscape, something which tens of thousands had never seen before. Judge R. C. Long, writing from Tallahassee, reports that the mercury on the Sunday night of the blizzard went down to 2 degrees below zero, this being a record of 9 degrees lower than ever before known; but while fruit and vegetables were wiped out, the supply of quail, snipe and lesser scaup ducks, Judge Long reports, is abundant, and a goodly number of winter shooters are finding the sport all that it could be, snowstorm or no snowstorm.

A correspondent writing from Rockingham, N. C., reports that the birds were not badly injured in that vicinity, while Mr. Chas. Hallock sends us from Fayetteville, in the same State, a story of universal slaughter perpetrated by the people when they found the game at their mercy. "The poor, starving and freezing birds," he writes, "robins, doves, larks, sparrows, woodpeckers—anything that flies or is able to fly—count as game; twenty to fifty robins make a common bag. Battues of twenty to thirty guns go dove shooting and bag seventeen to thirty apiece, the doves congregating at feeding places when snow buries everything else, and here falling easy victims to the gun."

From Charlestown, N. H., Von W. sends a record of mercury below the freezing point steadily from Jan. 24 to Feb. 17, and often below zero in the morning, with consequent hardship for the feathered woodfolk. "Many of us feel sore at heart," writes a Danvers, Mass., correspondent, "over the prospect that most of our quail have been killed by cold, hunger or suffocation. Some seem to think the birds will pull through all right, as the high wind drifted the snow. Some places it is 10 ft. deep and others only a few inches, and we have considerable high feed, such as bayberries, that makes a good winter food for the quail." We shall look for further reports of the effects of the great storm on the game.

The Sportsman Tourist.

Vacation on a Way-Back Farm.

I.

SUMMER came suddenly upon us from a cool spring, and the heat was enervating. I went to my office one morning and sat at my desk by the open window, too listless to work upon the architectural drawing before me. Above the desk was a rosewood case with glass doors, through which I could see my favorite guns. I love a gun as a small girl loves her doll; and I sat and looked, and longed to get out of the city to the broad country, where I could wander at will through woods and meadows with gun or fishpole. I opened the pile of letters on the desk. The bottom one was from a farmer in western Maine. When I was a boy, which wasn't many years ago, I spent a happy summer with this farmer, and we have exchanged occasional letters ever since. His family then consisted of himself, his wife, two well-grown girls and a small boy. The letter ended with:

"Susan, which is my eldest girl, has moved with her family clear over to Mattawaumkeag, and we ain't seen nothing of her for nigh two years, and don't hear often. Elmiry has got her a man, and was married last December. She lives over to Oxbow. Almon, he is big as any man now, and does most of the work around the farm; but we is mighty lonesome. 'Pears to me there ain't nothing to hinder your coming down and making us a visit. You come, anyhow. I am goin' down to the village next Friday, and I shall look for you on the morning train."

Why not go? I guess I will go. This is Thursday. I'll take to-night's boat to Portland, and the 5 o'clock train up the road, and the old fellow won't be disappointed, after all. To decide was to act. I wiped and put away my drawing instruments, closed my desk, and took down my new small-caliber rifle. From a drawer in the bookcase I took a long list of things necessary to convenience and comfort on hunting trips. I made this list a little at a time during many years. I am quite likely to go off on unexpected gunning and fishing trips, and by referring to this list I can select just what is necessary to any especial occasion, and not find, on my arrival, that I am desperately in need of something forgotten.

II.

The next morning found me on the train traveling northwest from Portland. With great peace and good will I watched the passing woods, streams and pastures, rich in the light and shade of a sunny summer morning. Four or five hours at good speed, with few stops, took me to a certain little railway station beside a little village clustered upon the high, sandy bank of a river. A delighted man was my farmer. Merrily we mounted his wagon and rattled away. For a mile or so the road runs along a sandy valley beside the river. Houses are scattered along, some with maple trees in front, some beside clusters of red or silver birches. Then commences a four-mile climb, up, continually up, over a roadbed of rolling stones and pebbles washed by every freshet. Not a human habitation the whole way. The great trees meet overhead. The hills slope sharply up on one side, down on the other. The horse has all he can do to haul the wagon, and the farmer and I walk beside. Finally we leave the woods for a level space, containing a great farm. We stop at the house to leave the mail and to exchange hearty greetings. Then onward and into the woods again, and upward. A long, hard climb, and the road turns around a hill. The woods cease, and there before us is a small upland valley, clear of trees, a knoll in the middle with a collection of low, scattered, farm buildings on it, and hills, mostly wood-covered, rising all around. Their only break is where the road runs in. Down a little slope we rattle, cross the brook, go a little further and cross it again, and then, looking up, we see the house, barn, woodshed and pig house, all apparently gathered close together.

The farmer's wife was at the door to meet us, but the boy was too shy, and was waiting in the barn for me to make first advances. Many are the delightful, natural country people I have lived with, but none so retired, quaint and old-fashioned as these. There is no neighbor for nearly two miles. From there to the next neighbor is four miles. A caller during the year is a rarity. The farmer's wife is about sixty years old and never has been further than twelve miles from this house, where she was born. Forty-seven years ago, when the farmer was twenty-one years of age, he "went up to Bostino" and now remembers every incident of that remarkable adventure.

Think of a boy fourteen years old, man grown, who never rode on a railroad, never heard of an electric car, never ate nor heard of oysters, lobsters, ice cream, chocolate, or tropical fruits, and can't imagine the sea, a tall building, or a theater. Do you say, "What an ignoramus?" Not a bit of it. There never was a more agreeable companion than he. He wasn't much of a talker, and for a week never said much but "Yes" or "No." But what he didn't know about all out-doors was hardly worth knowing. Always good-natured, always quiet, never tired, we tramped the forest and fields, fished, hunted, camped and sketched together. After making his acquaintance at the barn I asked him to go to the house with me to help me carry my trunk to my room; but my secret motive was to make him forget self-consciousness in curiosity to see my things. I thought his tongue would be loosened by questions; but therein I was mistaken. He sat and looked with evident interest; heard my explanations about a jointed fishpole, artificial flies and rubber worms; handled my rifle with deference; smelled my Java coffee and looked amused at the filter coffee-pot, but never opened his mouth.

Meantime the sun had gone behind the clouds, and I proposed that we try to catch some trout for supper. We moved a portion of the woodpile and dug him some worms—he said "No" to my offer of a rubber one—then went to the meadow southwest of the house, where a number of deep, bubbling springs gave rise to a brook. The brook appeared but a thread among the stubble, but was mysteriously wide and deep, for it had cut beneath

the sod on each side. Here were abundance of greedy trout. Trout are light or dark in color, according to whether they live in sunshine or shadow, and dark trout are the most beautiful fish in the world. Their backs are a very dark, rich brown-black; their sides a trifle lighter, with many brilliant, jewel-like spots of bright red, surrounded by yellow and light blue; the brown background shades to tawny yellow below and then blends into flashing silver on the belly. All trout are very shy and suspicious, and if the ground shakes, or they see the fisherman, or a moving shadow, or the bait is out of season, or looks suspicious, Mr. Trout coolly and persistently refuses to become acquainted with Mr. Fisherman.

We walked quietly and softly to the meadow, where we separated by a few hundred feet and approached the last roof. to the brook on all fours, taking up and putting down hand and knee with utmost caution. I felt again, as in boyhood, the intoxicating, wild instincts of the hunter. The gentle breeze blew in my face, and brought to my nostrils the sweet smell of the peppermint and spearmint, which trailed its stems in the water. Lying on my stomach, I used my utmost skill to fool the wary beauties, and was rewarded by occasional struggles with strong and desperate fish, trying to escape, or to rub off the hook, or break the slender line or pole. Out of the corner of my eye I could see that Almon, with equal skill and a real bait, an alder pole and a stout line, was putting two fish into his old burlap bag for one that went into my creel. When I hooked a fish I had more fun with it than he had with his, for my fish had a chance to escape and cripple my fishing apparatus too, and I had to put my skill against the fish's to see who should be victor. Which would you prefer, more fun or more fish? Why not combine both by putting a live bait on my hook? There was no other reason than that when we went fishing together we caught all that the family could eat, and that was enough. We fished down the stream to the road, where alders overhung little waterfalls, dark and quiet pools, and babbling runs, with bright pebbles and moss-covered boulders. I watched to see if Almon would jerk his fish out and tangle his line and dangle his fish on the bushes overhead, and get mad and use country swear words. Not he. A little motion of the wrist and a slight lifting of the pole sufficed.

When, toward evening, we returned to the house, the setting sun was sending long bars of light through the cloud banks. We set three chairs on the grass by the back porch, and while Almon called the hens I put a pan of trout in the left-hand chair, an empty pan in the right chair, and sat in the middle one, with a board on my knees. Around us were three cats, five dogs and a hundred or more hens. Every time a fish head was thrown there was a wild rush from all sides converging on the bait. The dogs and cats reached it first, hens flying, scratching and chucking on top of them in a rough and tumble scramble. The hens always finally secured the morsel, generally by picking it out of a dog's mouth. The dogs and cats were persevering, and contested as gamely for the fiftieth morsel as for the first. I called the largest cat and gave her a morsel from my hand. Instantly the cat was the center of a struggling mass of hens three deep on top of her. The cat rolled on her back and scratched for dear life, and the hens made a fearful racket. A hen which had been standing by dashed in and got the fish head and ran away, followed by a string of others. She had to fly to the house top to get a chance to eat it. We watched her swallow it whole, after many gulps and gasps, and then we went in.

The large, dim kitchen was a most delightful room at night. In the middle of one side was a great open fireplace, where a glowing bed of coals lighted the pots and pans set on them, or hanging by hooks or chains from a long crane. Beside the fireplace were the iron doors of a brick oven. The ceiling was but a couple of feet above the head, dark with age and smoke, and hung around the fireplace with strings of onions and dried apples. A long table stood in the middle of the room, set for supper. Opposite the fireplace an alcove between two large corner cupboards showed two doors leading to the family sleeping rooms. The two ends of the room had two windows each, and between the windows of one end was the sink. Here the fish were washed and rolled in corn meal, and soon we had the pleasure of seeing them curl and brown in boiling salt pork fat. Most of the good odor went up the chimney. We gathered at the table. A small lamp in its middle lit the white cloth, and left the rest of the room vague and shadowy. The dish of trout passed from hand to hand. We helped ourselves from a milk pan heaped high with young string beans and peas, crowned by a great lump of melting butter. Corn bread, tea and milk went with them. Then a great, steaming bean pot was brought from the brick oven, the lid removed, a long handled spoon stuck in, and I was helped to the most delicious Indian pudding I ever tasted; soft, jelly-like, wheyey, rich and satisfying.

After supper three of us sat before the fire and two of us talked. The farmer's wife was doing the dishes at the sink. The farmer sat at my right with his feet on a stool, head bent forward, and grizzily beard reaching down his vest. Almon sat on an uncomfortable chair at the left, heels on the top round, bent forward, with hands clasped around his knees. The farmer smoked his clay pipe and watched the fire, and talked at it to me, and mostly asked questions. The farmer's wife soon joined us. We put a fresh stick on the coals and watched the ever-changing flames, and talked of the years gone by. The farmer told stories of his boyhood. I supposed the region was then one of bears and wolves and wild-cats, but he told me that it was then well dotted with farms. The companions of his boyhood had died or moved away; their children had gone to manufacturing towns, and the farm lands had merged into his or gone into the hands of the great landed proprietor who lived next down the road. The farmer's wife soon fell asleep in her chair, and I took the hint that these people usually retire and rise with the sun.

III.

My bed was a great four-poster in the clean-smelling spare room at the other end of the house. How delicious was the feeling of that crisp, firm, corn-husk mattress under the smooth sheet. Once in the night I was awak-

ened by the rush of barking dogs past my window, the sound growing fainter in the distance and finally dying away down the road. I spoke of it in the morning while I was watching Almon and his father milking in the barn.

"Might hev be'n a fox, or a coon, or mebbe somethin' bigger," said the farmer. "One year we was mighty pestered with some critter that kept ketchin' our hens an' clawin' the cats. My wife got so scared that she didn't dare venter outside the door nights. Finally we ketched him in a steel trap, an' what do you think it was?" I guessed a lynx. "Nope, it was a whoppin' big, black, stray tomcat, an' he fit so we smashed the trap tryin' to kill him. The curis' thing is, whar he come from. They ain't nobody within twenty miles ever had such a cat." I had my private suspicions that he didn't always know cats from "somethin' bigger."

A horn sounded from the house. "Breakfast," said the farmer. We turned the cattle out into the lane, whose low stone walls, overhung by raspberry bushes, and shaded on one side by overhanging boughs of apple trees, directed them to the forest-girt pasture that occupied the hill slopes on all sides except toward the road. Milk pails in hand, we repaired to the house. An enormous pewter coffee-pot stood by my plate.

"I b'lieve you said you wanted to make your own coffee," said the housewife.

"I think I have an improvement on the old method," I replied, and brought my nickel apparatus. While all stood watching, the coffee was put in the filter, set in the pot, boiling water was poured in the strainer and upon the coffee, and the apparatus assembled air-tight.

"I guess you are mighty fond of coffee," said the farmer.

"I guess so too," I replied, and smiled at the recollection of the great yellow package the farmer had brought from the village and exhibited to his wife with the remark: "How much do you suppose I giv' fer that?" She looked it all over, read all the printing, hefted it, and guessed. Said he: "Fifteen cents, and this spoonholder throwed into the bargain." "Let's have that kind right along," said she, "and mebbe we'll get some dishes." "Then if you don't need the dishes," said I, "you can sell them to Elmiry and have the coffee for nothing."

While we were eating breakfast the farmer said: "That remark o' yourn yistiddy about sellin' Elmiry the dishes an' havin' the coffee for nothin' 'minds me of the way Hi Robinson got somethin' fer nothin' out er the store-keeper at the village. You 'member Hi, don't you? He's kinder slow spoken, 'n' some folks calls him foolish. One day I was settin' in the store a spell, with a lot more, an' in comes Hi. He goes up to Lish, who keeps the store, an' takes an egg out o' his pocket an' says: 'How'll yer swap?' 'Oh, I d'n' kno's I want to swap fer one egg,' says Lish, 'what do you want for it?' 'A darnin' needle,' 'Well, I'll swap with you,' says Lish, an' took the egg and giv' him ther darnin' needle. Hi stood 'round a while, an' then he says, drawlin' like, 'Say, ain't yer goin' ter treat?' 'Treat? On one darnin' needle?' says Lish, 'not much.' 'Feller 'cross the way will,' says Hi. Lish grinned. 'All right,' says he, jest ter humor him, 'what'll yer have?' 'Cider 'n' aig,' says Hi. That tickled the rest on us, but Lish brought the cider, an' broke ther egg into it—Hi's own egg—an' Hi see it was a double yelker. Hi took up ther glass an' looked at ther egg some time. Then he says, says he: 'Say, hadn't yer better gimme 'nother darnin' needle?'"

IV.

Stories and breakfast ended, I took the rifle from its rest above the mantel shelf and followed the road toward the next neighbor's. The clouds were high and fleecy, the sun in full splendor, but for summer time not very hot. In that altitude the heat is never very intense. Going down the knoll toward the first bridge presented the picture of the yellow road cut in the turf, winding, and undulating, full of light and shade and color, softened by bordering vegetation, and disappearing in shadow. A gentle breeze brought sweet country odors. All about, birds, trees, grass and flowers. I walked softly, drinking enjoyment. The woods approached, and their dim recesses seemed black by contrast. What is that dim form? It may be the next neighbor's red setter dog. So vague were the outlines that I stopped to await a motion. There was no motion. I opened the rifle and snapped the breech down. At the click the shadowy form became a fox on the gallop to circle past me. The fox kept steadily to his path, and a bullet from the rifle began a cross path. The two paths and the two bodies, the big soft one and the little hard one, instantly intersected, and I held a harmless fox in my arms and stroked his soft fur. Shall I go back to the house with him? No; I will put him in a tree out of the way of harm.

The forest path lured on. Patches of sunlight moved on the forest floor, golden bright, lighting green moss and checkerberry plant, brown twigs, dark red and russet leaves. Vistas in half-light showed between the tree trunks. Red squirrels chirred, occasional gray ones ran along nearby boughs, deer had left frequent evidences. The lives of all were safe; the rifle was not for them during this season. The road led on and on, with delight at every step. Finally, like sighting a telescope, straight down the dark road was a bright picture of a large white farmhouse, with outbuildings attached, a garden, a woodpile, and a great protecting tree. From the upper windows of the house everything the sight could reach belonged to this proprietor: hills and valleys, forest, field, stream and meadow. Truly, he could say, "Monarch of all I survey."

I found him seated at the grindstone in the shadow of the barn, sharpening a scythe. He reached for my rifle and looked it all over critically. "That's a mighty pretty gun. It's about the size and heft of my grandsir's pea-rifle, only it's got a smaller hole. Seems to me 'tain't much more 'n a toy. You calc'latin' to shoot any b'ars with it?"

"No, I guess not. I haven't lost any bears. I brought it along more for company than for game. The game law is on' now, you know."

"Game law? Humph! Ain't nobody around here to touch you if you shoot anything you want. Ther's plenty of deers around, 'n' pa'tridges is thick 's hens up in the parsters. Help yourself."

"I shot a fox coming down here."

"Did you, now? With that little gun?"

"That little gun has more business to it than you think. With a soft pointed bullet and high pressure powder you could make beef of one of your cows at 50 yds. first shot. But I'm looking for woodchucks this morning. Got any chucks hereabouts?"

"Chucks enough to fill the barn right out in that field beyond the orchard."

To the field I went at once. It reminded me of a stifened sea or a rolling prairie. From the highest ridge I could see the whole of it at once, about half a mile wide by a mile long. Yellow and brown stubble shone in the sun. Scattered apple trees dotted one end. Woods bordered all around. A trickling stream sparkled and disappeared amid long grass and tufts of bushes. Within range of the rifle I counted fourteen black dots, each with a red patch in front. There are the holes, anyway. Now for the chucks.

I stretched out at full length on the side of the ridge away from most of the holes and waited. The sun warmed my back and the breeze cooled one side of my face. Rising heat-waves made the air shimmer, and distant objects seemed to waver. In the blue distance above the woods rose the outlines of distant hills. There patches of bare rock shimmered like gray steel were outlined by shade lines of deepest purple. Clumps of small trees presented soft forms of yellow-green. Old trunks of dead birches made vertical lines of white. A long time passed in the enjoyment of nature. Solitude, quiet, peaceful, and richly beautiful, brought to the imagination romance and vaguely drifting stories. I rested my head on my outstretched arm and luxuriated in the beautiful pictures that, without effort, formed and changed, and passed before the mind's eye, an involuntary nature's drama. From my reverie I fell to watching the ants that were investigating the Gulliver who lay over their tiny nests. Their little feet and antennæ tickled my bare skin, and I started to rise, and then I recollected why I was there. Probably that motion had sent every woodchuck head back into its hole. No, there sat three chucks upright, each on his earth-patch. Several holes were gray with heads, and I knew just how all the noses were working and smelling for a scent of the intruder. After a while I rolled a green apple down the opposite side of the ridge. The smallest chuck ran for it at once and sat up in plain view and ate it. More chucks appeared. Any one of them was an easy shot, but I decided to give them a fair chance for their lives. I selected one which I judged to a fat young female, and waved my hand on high. Instantly every chuck ran for his hole. Most of them halted at the entrance and turned their heads around in my direction and waited to see if they were pursued. I whistled and in they dived, turned around, and almost immediately stuck their heads out to look and sniff. I guessed my youngster to be 75 yds. distant, took out the long-distance cartridge and quietly substituted a soft-nosed, short-range one, raised the rifle sight two notches, took a careful bead on the center of the forehead and gently pressed the trigger. Every head but that one disappeared at the report. That one stayed just where it was. I didn't need to go get it, for it would certainly wait for me, so I gently put another cartridge in place and kept quiet. In a few minutes another hole became gray. A change in the rifle sight, another report like the crack of a child's whip, and the hole remained gray. A much longer wait, and then another substitution of a gray spot for a black one. Another crack, and one more chuck became mine. Three chucks and an 8lb. rifle were enough to lug on a warm day, so I went from hole to hole and drew out the limp occupants by the ears. I called with my burden at the great farmhouse. They were having dinner, and I gladly accepted an urgent invitation to "set up to the table."

Master and mistress, farm hands and maids, all put their knees beneath the same broad board. The jests were merry and personal, and the beans, boiled pork, cucumbers, "white cake," "sweet cake" and pie, as good as they smelled. Cheese and cider, after the meal, were passed as we tilted back in our chairs for the noonday rest. The afternoon was spent in the hay field. The men took turns in pitching on and raking after, while I trod the load. In the shadow of a haystack was a jug of cider wrapped in a wet cloth. We all took care not to let it get lonesome.

In the cool of the late afternoon I started home with two of the woodchucks, and gathered the fox on the way. The dogs spied me from afar, and the game had to be put in a tree to keep it whole, while I shouted for the dogs to be called home and shut up before I could go on. The setting sun was richly coloring the clouds beyond the house as I toiled up the knoll with my burden, and supper and rest were pleasant prospects.

V.

No church bells broke the stillness of the next morning. Neither did any crack of the rifle, or cast of fly or bait. But we did desecrate the early Sabbath morning by preparing the game. Seated on a couple of great peeled hemlock logs, Almon dressed the fat young woodchuck for roasting, and tacked the skins on the wood house door, while I deprived the fox of his robe. The hens recognized no Sunday, and were as amusingly frantic for morsels of meat and fat as they had been before for fish cleanings. The hen house, in front of us, gray and weatherworn, was a most interesting example of how twisted and rickety a hen house can be and yet stand. The farmer came and sat on a log, and whittled for the sake of doing something.

"I kinder think we'll hev company this arnoon. The stoorkeeper seed ye when ye come, an' he's prob'ly told ev'rybody 'round that there's that same city feller up here, an' some on 'em 'll be up to see you."

Sure enough, dinner was hardly done when the dogs set up a chorus and rushed away down the road. We all went to the door and peered down the road after them. Soon a team emerged from the woods and rattled down the road to the accompaniment of flying gravel and barking dogs, boomed across the bridges, and crawled slowly up the knoll. "Kin you make out who it is?" said the farmer to Almon. "Link Belknap," said Almon. Now I knew that Link lived fully ten miles away, and I appreciated this kindness in coming so far to see me, and concluded that I would treat him to the best cigar he

ever smoked. By this time the wagon came into view again, and I saw there were Link, his wife, two daughters and a man I didn't know. They drove up to the door and proceeded to climb out. "How-y-er," said the farmer. "How-y-er," said Link, and that was all the greeting that passed between them. They seemed drawn within themselves, like a quiet tortoise drawn within his shell because of something unusual in the vicinity. The women greeted the farmer's wife in the same shy way, but smilingly. I tried to make up for the apparent lack of cordiality, but I knew enough not say much at first. The horse was hitched in the shade, and we all repaired to "the settin' room," not by invitation, but seemingly by instinct. The "settin' room" was a great room taking the whole width of the house between the kitchen and my room, and here all drew chairs against the walls, and sat stiffly in the embarrassment of strange surroundings. The women seemed able to find a little something to say, and I tried city talk on the men, to draw them out, but soon found they preferred crops, the weather, farm work and things they knew about. Another chorus from the dogs announced Lish, the storekeeper, and his "wimmin' folks." We now made quite a party, and pretty well filled the wall space; but when another ferocious outburst and another "Whoa" brought a man, his wife and baby, the men just naturally stayed out of doors, and left the women to keep house. We drifted along to the orchard gate, and sat on the wall and the bars, and smoked my cigars, and heard about everybody's business, while I wondered what to do about all those women who had come so far, some of them from sheer friendliness, some of them for the ride, and the rest out of curiosity, to see a strange "city feller." What would you do in a case like that? The problem finally solved itself, and the wild strawberry patch in the afternoon shade of the woods knows the story of the city man's attempt to look unconscious under covert observation.

All hands stayed to supper, although one and all made a show of protesting, for politeness' sake. The piece de resistance was a baked stuffed woodchuck garnished with water cress. Cold beans and brown bread, "white cake," "dried apple sweet cake," pie, preserved plums, cherry jam, and the ever-present stewed leaves called tea were consumed in wholesale quantities. All the women felt it their duty to compliment the hostess on her "white cake"—known to city people as hot saleratus biscuit—and pan after pan of light, fluffy, red-hot cakes disappeared into dyspeptic stomachs. The correct way was to put a lump of butter on quarter of a biscuit, stuff it all into the mouth, fill any remaining space in the mouth with tea, and swallow both at once. Supper produced good cheer and heartiness and loosened all tongues. One after the other, in a string, the three teams rattled away, after cordial invitations to visit each family.

"Well," said I when we were again by ourselves in the cozy kitchen, "this has been a red-letter day for you."

"Yes," said the farmer, "I've gin away a good many meals in my life, an' I never make no 'count of it. I like to see folks around, an' I hope there'll be some come every Sunday. I ain't goin' to let you go home before winter." I smiled in the darkness for a long time.

VI.

The next day broke dark and cloudy. At breakfast I got permission for Almon to accompany me to Rattlesnake Pond, and he was so pleased he opened his mouth several times to speak, but thought better of it. We got a couple of gunnybags from the attic, to carry a spare flannel shirt apiece, lunch, bait and fish lines, hung them over the shoulders and tied them around the waist to keep them in place, and gun in hand, we went across the pasture and took an old trail through the woods. Up hill and down dale, over crags and through glades we hurried. An hour and a half of fast traveling brought us to a beaten road. We followed it a good many miles, and then took to the woods again. Another couple of miles, and we came suddenly to the shore of a large pond. It was long and wide. Rocky, wood-covered promontories extended out into it, cutting it into bays, and adding to the delight of exploration by continually offering new points of view. In most places the woods grew to the water's edge. Where we were was a grassy beach. We crossed a ridge and saw a fence running far out into the water, and a cow trying to wade around it. That meant a house near by. We sought the house, and gained it after a dispute with the dog.

The owner was willing that we should take his boat, and between us we lugged it to the water. Almon had never been in a boat, so we tied the guns by long ropes to the thwarts, so as not to lose them if we upset. Almon cut a fish pole, while I put mine together. Then we went along shore with a stick apiece and whacked a few dozen frogs on the heads, for bait for the 2ft. long pickerel we were looking for. Incidentally we secured a pretty, black turtle with bright yellow spots on its back. Then we pushed off and I paddled gently along the lily pads while Almon trolled. The water was placid, the air was quiet, the boat glided noiselessly. The peace of gentle Arcady brooded over all. Two-foot pickerel, or any other pickerel, didn't seem to want our acquaintance. I turned the boat's prow out into the pond, and started slowly across. Suddenly a peculiar wha-hoo-hoo-oo seemed to waver in the air all over the water. Almon caught my eye questioningly. Pretty soon we heard it again, but couldn't locate it, for it seemed to be all over the pond at once. "What do you think it is," I asked, "a bear or a panther?"

"Ha, ha, that's the time you got fooled. It's a loon. Watch the bays near shore for a black speck. That's about all that shows; he swims so deep in the water. We will try him with the rifle, and you will see he will dive at the flash, and be safe under water before the bullet gets to him."

Just then a sounding splash was heard, and Almon's pole was jerked from his careless hand and rushed away up the pond like an arrow from a bow. Away we went after it as fast as I could paddle, and after many trials caught it. Some monster at the end of the line pulled and struggled with tremendous strength, and darted hither and thither with such speed that the taut line cut the water with the sheer noise scissors make running through cambric. The boat rocked and pitched, and Almon pulled and pulled and held on for dear life, and the thing tried to dive and down it went in spite of his efforts until the stout pole bent half a circle, and the point was under

water. Suddenly the strain relaxed and Almon's strength threw high in air the biggest pickerel I ever saw. It seemed as if he went above the tree tops before he turned and came down. He fell flat on his side with a resounding splash that threw the spray in every direction, and we picked him up stunned and limp. Didn't we gloat over that prize?

I laid down the paddle and we both set to fishing in earnest. Pretty soon I had a fish on that made the reel sing, and I played him until he was tired, and then lifted him in to keep the first one company. He was a big fish, but he looked like a baby alongside of the other one. We caught one more, and not another bite could we get. Even the loons had stopped hallooing to us. So we went where the water sloped sharply down a bank, with pond lilies growing in a neighboring shallow. There we put on smaller hooks and baited them with worms, with a sinker just above, and caught perch, small bass, and sun-fish about as fast as we could pull them in. A mink ran along the shore near by. A flock of partridges came to the water and drank without seeming to mind us in the least. Pretty soon a hedgehog looked out at us and tried to catch a breeze from our direction. "Try your gun on him," said I. "Too far," said Almon. So the rifle sent its message and he joined the party.

Then we went ashore and built a fire, and broiled some fish, and ate our hard-boiled eggs, cheese, fish and gingerbread. Robins, bluebirds, yellow birds and a scarlet tanager watched us from above. Squirrels and a woodpecker were tamer and showed a desire to be friendly. We took our luxurious ease and watched our wild acquaintances, and looked out over the pond now rippling in an afternoon breeze, gray and blue-gray from cloud reflections and brown in quiet places. Then we fished again. Pretty soon we saw a very large bird flying on the water with wings flapping it at every stroke, tail and legs dragging as if held from below. "There's your loon," said I, "trying to rise with his head to the wind. He is so heavy for his wing size that he has hard work to get out of the water, and if he were in a very small pond with high trees all around he would be obliged to stay there, as if he were in a trap." The loon, free above the water, circled the pond twice to get above the tree tops, long neck outstretched and wings going like a blur. "That loon comes here to feed, and the chances are that he goes to some nearby pond to sleep, and that reminds me that, with the distance we have to go, we better be starting for home." I looked at my watch and it was 4:30.

We hurried the boat ashore and tied it where we had been told, divided the fish, hedgehog and chipmunks between us, and found we had a pretty good load apiece. We could not go home at the speed we had come, and darkness and imminent prospect of rain overtook us on the beaten road. We had difficulty in finding the path into the forest, and greater difficulty to keep the path, which wasn't much of a path in the daytime. After a time we concluded we were lost. I had a few matches, and we lighted one. No sign of a path. "Well, my boy, I guess we better find the nearest place and camp." But Almon was afraid his parents would worry, and thought we better push on a little while longer. When only one match was left we saw a blazed tree, which Almon recognized, and from which he thought he could go home. On and on we stumbled, with frequent falls in inky darkness, which I dreaded for my gun's sake. Yet the poor gun would be about as badly off if we camped and rain came on. So we kept pushing ahead, Almon leading, until I ran into the roots of an upturned tree, which struck me at once in knees, stomach and head. That struck me as a familiar bump, and I spent my last match to look at it. Yes, I knew that tree, and we were going wrong, for the fallen trunk ought to point nearly home. On we went again with hopes renewed, and soon we reached the pasture. I know that one of us at least felt like singing.

Down the pasture slope we went, with lights in the windows in full view, and cool breeze feeling good to the face, for we were bathed in perspiration from hard traveling and extra shirts on. What's that odor? That's the very odor that has haunted me for years. I have a curious knack of never forgetting a smell, and the remembrance of odors, like other recollections, occasionally comes to mind. This particular smell was apparently a recollection of childhood, and had come to memory many times, and bothered me a good deal, for, try as I would, I could neither associate it with subject nor place. It was only a delightful, fugitive trick of memory. Now here it was in reality. I started on a run for the house, and it grew constantly stronger, richer and more alluring. I threw open the porch door, and without stopping to greet the anxious inmates, "What's that smell?" I asked. The room was fragrant with it, but it was strongest in one direction, and I traced it right up to the brick oven, where a thin steam came through the crack at the top of the door. "What are you baking?" I queried. "Cake pudding," said the farmer's wife. Instantly a flood of recollections came over me, and I remembered that delicious dish I had had once, and only once, in my life, and never could recollect where. Supper was a delight, not only because of hunger, but because of that dessert of the queerest, richest sticky paste of a pudding, eaten with cream, that ever a mortal put into his watering mouth. Like the Indian pudding, it was baked in a closely covered pot. Why it is so good I can not tell, for it is made of common scraps of cake, gingerbread, "white cake," butter and molasses. What else the farmer's wife alone knows, and it is her secret of manipulation that makes it what it is, unique, delicious, and what it is.

VII.

Well, I wish I could tell of all the pleasant incidents of the weeks at this charming old-fashioned farm. I would like to tell the story of how Almon and I fell over a sleeping bear, and the way Almon told the adventure afterward, for the fright loosened his tongue, and he thereafter forgot his bashfulness. But stories and vacations must come to an end some time, and the day finally came when I was to return to the city. Our next neighbor, who was going to the village, offered to take me, and at the appointed time drove up to the house. We put the trunk aboard, while all stood around to say good-by and have the last handshake.

"Now you be sure to come down this fall, when pa'tridges is good," said the farmer.

"Indeed I will try to," said I.

"Tell your father to come down," he called, as I was getting into the wagon.

"Tell your mother to come down," called his wife as I rode away.

"Say, bring your woman down," he called as loud as he could when I was getting far off.

Then, as we rolled over the bridges, Almon came running after as if he or I had forgotten something. "Good-by, come soon," he called at the strength of his lungs. And I stood up in the wagon, and making a trumpet of my hands, at the full strength of my lungs I called back, "I will."

CHAS. WINTHROP SAWYER.

Yukon Notes.

The Seamy Side of the Klondike.

Old man McNeally, who has been to every mining excitement of consequence in the last fifty years, and who came to the Klondike direct from Bulwayo, South Africa, was very much amused at the ideas some of the Klondikers had of finding gold. Where a place had real merit, he said, perhaps 200 men out of 20,000 found gold. The remaining 19,800 found nothing but experience as far as mining is concerned. Mr. Casey, who followed gold rushes as a business and is a town site promoter, corroborated the remark and stated that at Randburg, in Southern California, the town lots sold for more money than the mines ever produced. The Klondike is undoubtedly a remarkable gold strike, but it has been boomed far above its merits in certain respects. Most of the men who went in in 1896 did surprisingly well. Many who went in in 1897 were equally lucky, but of those who went in in 1898 *new to the country* the number of successful men is hardly worth consideration.

In the winter of 1896-1897 there were probably a thousand men on the Yukon. The winter of 1897-1898 there were approximately 5,500, of whom the great majority had come from Seattle and Pacific coast towns. The present winter there are upwards of 40,000.

There has been little or nothing to warrant the last rush. All the profitable mining and business enterprises had been taken up before these men came. They were nothing more than a sacrifice offered up to the transportation companies and the mining claim swindlers, who hold up their hands in holy horror at the suggestion of working themselves the valuable properties they offer for investment. Certain of the transportation companies have a heavy charge to answer for. Corporations have no souls to lose, but I can fancy that individual members of these companies may some time or other be visited by a nightmare of the Frozen North and given a realizing sense of the ruin their cupidity has caused. Bony arms from famine stricken bodies will point at them and human forms rotted with scurvy will make the accusing gesture. They will see poor Madison, who lost both legs and arms by freezing, and in his despair refused nourishment to his maimed body and died. And perhaps they will know something of the grief of helpless women and children pining for their loved ones, wrecking their lives far away, where

"In the desolate regions of Death, in the vastness
Of the grim and implacable North, in the fastness
Of want and the skeleton spectre of Cold,
Sits the Ice King."

There certainly will be some retribution for the men who persistently catch up every false rumor of gold that they would not themselves credit for an instant, and alluringly advertise the news, with the sole object of increasing the revenues of their steamships or railroads or trading companies. They are careful not to make the statements on their own authority, but they see to it that the reports gain circulation. In several instances we saw reports of gold strikes started by men who hoped to swindle a few outsiders in a modest way by selling claims. These reports were caught up by the agents of transportation companies and the press and heralded as gospel news of pristine purity. The number of dollars to the pan taken out was definitely stated, and the new creek was declared a bonanza. The result would be a certain number of unsophisticated gold seekers enticed to the spot and stripped of their money, and in the end of food, strength, courage and belief in God or man.

In some instances claims were salted with gold purchased from successful returning miners. I have a particular case in mind, where I was personally approached and asked to boom a property that was known to be barren. Claims were to be sold cheap, and an important Government official was to get 50 per cent. of the profits for giving the tip to newcomers who asked his advice. Any other man can tell such stories from his own experience. To give a more extended field of operations, the Copper River country was boomed by some of the same men who exploited the Klondike. There hadn't been any gold found there at the time and there hasn't been any found since. Yet thousands of men, by garbled and fictitious reports, were induced to prospect that country, and a percentage have left their bones from Valdes Glacier to the Tanana.

The Yukon is a dangerous country only in a relative sense. The crime of the promoters lies in inducing unfitted men to go there and holding out impossible prizes before them. Men who go in as I did for the experience and as a rest from business, without any particular necessity for succeeding more than governs a man in the outside world, and who like a rough life, will not find it a bad country. One should not put much faith in the mining, however. The letter which follows shows how an old miner regards the Klondike. I do not give the name of the man who wrote it, because I have not his permission to do so, but he is one of that rare breed of exploring prospectors who spend their lives in the roughest and least known countries—a man who knows "the world's white roof tree," and whose eyes have gazed on silent crags and abysmal gorges with only the screaming eagle for company.

In 1866 he crossed the Arctic timber belt, 2,000 miles, taking four years to the trip. He traded and prospected in Northern British Columbia. On the Athabasca he met three Montana miners, one of whom was Dancing Bill, and spent some time prospecting with them. He discovered the Onineca Mining District 600 miles north

of Kamloops, which was the most prosperous camp of its time. Recently he turned up at Cook's Inlet. In the summer of '97 he was in the Klondike. Writing from Dawson, Nov. 17, 1897, he says:

"I have not been able to get hold of anything I thought would pay. My best chance was what they call a lay here; in other countries it would be a lease. The other day I had to throw it up. Seventy-five per cent. of the lays don't pay. There are thirty-five or forty good claims here; balance are common; hardly wages.

"When I got here everything was located that was worth anything. Everything is staked—brooks, creeks, ravines, gulches and hills—all in speculation. All expect to sell next spring, when the Cheechakoes (Hudson Bay Chinook for tenderfeet) get in.

"Grub is starvation prices: Flour, \$75 per sack (50lbs.) to-day; bacon, \$1.25 per pound."

[No orders were accepted for provisions at stores in Dawson, according to Mr. Baker, of the A. C. Company, after Sept. 13, as goods were not received up river. Previous orders were filled in part only, though later some orders were filled from caches belonging to the traders.]

"I think I can live till June if I don't freeze to death. Thieves so plenty you have to sit down on your grub to keep them from stealing it, and, friend, it is the worst mining camp I ever got into, and God knows if I ever get out of this I will try never to get into another like it.

"Seventy-five per cent. of the old-timers are praying to get out of the country. I have not made any money and don't expect to. If I can raise one sack of flour next July I will try to pole up the river to a country where there is something to eat. All the talk here is of grub."

Why is it that the transportation companies do not publish such letters? They get them often enough.

J. B. BURNHAM.

Just About a Boy.—XVII.

"THIS here's whut yeh call sage brush, is it?" inquired the boy, as he climbed up in the wagon seat with one of the highly scented shrubs in his hand and turned it over and over, inspecting every branch and leaf. "Seems 's 'ough it'd ought to grow bigger'n that if it was goin' to grow 't all, but I reckon they's a reason why it don't if a feller juss know'd it."

"Well," I replied, "you notice that this ground is very hard, and that water is pretty scarce—two conditions that have helped to produce this knotty, gnarly little excuse for a tree. I have seen them further west where they grew 6 or 8 ft. high in the creek bottoms near water. Take it up in the foothills this side of the main range, where the soil is fairly good and the water is plenty, there you will see it grow to a good-sized bush."

"Hain't much water here 't any time o' year, I sh'd judge, juss fr'm th' looks o' things, is they?"

"No, not very much. You see, this country is bad lands—that is Pine Ridge off yonder where you can see that chain of hills with the evergreens on. Over here is the South Fork of the Cheyenne River, where it runs around the south edge of the Black Hills, or, rather, between the hills and the bad lands.

"This is a curious country up here, you notice. The line of formation is as clear between the hills and the bad lands as though they were miles apart. Here the water is loaded with alkali—across the Cheyenne River it is good. There is no grass nor rocks here to speak of and across the river both are plenty. Here it is bad lands; there it is mountains and fairly good soil."

"That's kind o' curious, ain't it? What makes it that way?"

"It is the formation, that is all—just a geological freak. The bad lands are a sedimentary formation and the hills are an upheaval. The probabilities are that what we see in the present Black Hills country is nothing more nor less than the tops of a half-buried mountain range, and that the country we are traveling over now is the bottom of some ancient lake that—"

"Whoa! gimme th' shotgun!"

The boy grabbed the gun and tumbled out of the wagon in a reckless way that endangered himself and the whole outfit, but, boylike, landed on his feet and ready for business. Walking back and to one side of the road a few paces, he flushed a pair of pintail grouse, both of which came tumbling down as the gun cracked twice in quick succession.

"What kind o' prairie chickens d' yeh call them?" he asked, as he climbed back and inspected his birds. "I never saw no chickens like them down 'long th' river at home."

"No, I guess you never did. Those birds are pintail grouse, and the prairie chicken is a different grouse altogether. This one lives up here along the streams, and only comes up in the high country to nest. You should have left them both alone, as they are probably a pair that are nesting around here some place."

"That's so," said the boy. "Fact is, I never thought nothin' 'bout it when I shot 'em. I juss seen a new kind o' bird 'n' took 'em in. Reckon I'll haff to r'member 'bout sich things after this too—less'n we're short o' meat er somp'n."

All day long we drove over the clay hills and along the sage brush flats, crossing the Cheyenne River without accident in time to go into camp on the north bank, where a little clump of cottonwood trees made us feel as if we had friends near by instead of being just a wandering outfit all alone in the wilderness, and an Indian wilderness at that, for we were not so very many miles from the spot where old Sitting Bull got the long call for the happy hunting grounds in after years.

We would soon be in among the Black Hills now, and the boy kept up a rapid fire of questioning that got me busy finding answers for.

"Say, gee!" he remarked, as he put the kettle on containing the two grouse, with the idea of producing one of his camp stews—made from any kind of game that came handy, seasoned with vegetables and a bit of pork. "Say, I'm juss hankerin' fer a crack at a elk er deer er bear—don't care much which, but I want to git a shot at somp'n big. This here ole .45-70 o' mine 's juss gittin' rusty fr somp'n to do. Here we been out two weeks

'bout 'n' we hain't seen nothin' bigger'n a coyote, 'ceptin' them two antelope down 'n th' sand hills, 'n' yeh wouldn't let me shoot at them."

"Look here, son, I told you why you shouldn't shoot antelope, or deer either, for that matter, in the spring, didn't I? Now here you are getting bloodthirsty again, and you don't stop to consider that we have plenty to eat, and that big game in the spring is the last thing any white man wants to eat anyhow. Now, you just keep your ammunition until we run out of grub or some Sioux wants our hair for his own personal decoration; then you may blaze away to your heart's content. Otherwise, don't get foolish and do things that you might regret."

"I guess they's a heap more sense 'n they is poetry in that, too," said the boy, good naturedly. "I ought to know better, 'n' I do know better, too, 'n to kill things 'n th' spring, but I reckon a feller gits sort o' forgetful like, sometimes, 'n' juss wants to kill everything he sees juss cos he can. Course, bears 'n' kiotes don't count, 'n' 'f ever I run 'crost a bear I'm goin' to shoot 'n' keep a shootin' tull I git him er haff to run."

"You had better give any bear that you meet in this part of the country the right of way unless you've things all your own way," I answered. "They grow pretty big up here, and they have a nasty habit of clawing people all to pieces after you shoot them full of holes. They have a way of living long enough to damage a man pretty considerably after they are shot through the heart."

"We'll," said the youngster, reflectively, chewing a straw as he looked into the blaze, "they's one thing sure; if I see a bear 'n' kin git a good stiddy shot at his ole head I'm goin' to crack away, 'n' I bet he won't feel much like eatin' me up after one of these ole .45-70s o' mine goes through him 'tween his year 'n' his eye."

"You had better put it a little further back, for a bear's brain is mostly behind his ears and pretty low down. Aim low and well back and you have a chance to break his neck and to brain-shoot him, in which case he would probably be through with the troubles of this mundane sphere."

"Huh! Gittin' funny, ain't yeh, on this here bear talk."

"Oh, no; just giving a rank young tenderfoot a few pointers, that's all. I think, however, that you will not need many pointers on what to do if you meet one of these bears that run through this country—you'll be mostly running."

"Oh, I dunno! Course I ain't goin' to take no fool chances with a big bear; but if one of them gives me a haff a show I'll juss everlastin'ly lambaste him full o' holes er quit shootin'—that's a sure thing."

"Better let him get away if he will, my boy. They're mighty unhandy to have around the house."

"We'll see," he answered, reluctant to give up, and I thought perhaps he'd better be taken care of while we were up there for fear he would do something he would regret if he met a big bear. However, my fears were groundless, for he was with big Ike Ward when he met his bear, and Ike did all the killing, while the boy stood by and took a big dose of experience that might be called bear cure.

"How long 'll it be 'fore we git into real mount'ins?" he asked, as he rolled up in his blanket and waited for sleep.

"About to-morrow or next day, I guess—depends on the trail we take. If we go up Skull Creek we ought to camp about Kara Creek or at the foot of Inyan Kara Mountain day after to-morrow night; I should think."

"Inyan Kara? Whut kind o' a name's that?"

"Sioux. Means a mountain inside of a mountain. Now let's go to sleep. I'm dog tired."

"Aw right." EL COMANCHO

Natural History.

The Crow as a Nest Robber.

GLEN ELLYN, Ill., Feb. 6.—*Editor Forest and Stream:* Although I disclaim all intentions of wilfully condemning an already much prejudiced and perhaps beneficial species, yet, in reviewing the case as presented under the above heading in your issue of Nov. 5, 1898, I—from my own experience—cannot but sympathize with the position taken by its author, Kenewah.

The question of the crow's usefulness occasionally comes to the front, and with much diversity of opinion pro and con. There are many who still hold views similar to mine concerning the destructive habits of corvus. On the other hand, those who have given the subject an exhaustive study, and are better placed perhaps for conducting an examination of this kind, make a far more conservative estimate with regard to the true economic status of this much-despised "black brigand of the woods." In other words, we find that the crow's bad habits are in a great measure counterbalanced by the good service he renders in the destruction of noxious insects. This appears to be particularly true of certain sections in the New England States, and to a greater or less degree doubtless over the bird's entire range. And here is the phase of the question which has given rise to much speculation: We know that the crow is a pilferer, and perhaps realize that during certain seasons he may be a friend to the farmer, but do we know equally well that his bad turns are fully offset in all cases by his better and less known habits?

That the crow's habits vary in different localities is quite apparent, at least to me. Here in Du Page county, Ill., I do not know that he has shown a marked preference for the sprouting corn. Neither do I know that the farmers of this section resort to the customary devices to drive them from their fields, although considerable corn is raised yearly in this county, while crows are very numerous. Unfortunately little examination of the stomach contents has been made, but, as the crows seem to work a good deal in the meadows, they doubtless devour quantities of field insects, together with occasional meadow rodents. A staple article of diet here, and of which it is known that great quantities are eaten, is the crawfish. This is attested to by the numerous remains of these crustaceans which are

found on every hand; besides, crows are often seen feeding on them. But the crow's worst habit here is his persistent robbing of the nests of that much-valued bird the pinnated grouse. For the past eight years I have found abundant evidence against him in this respect, and almost every year find many egg shells scattered about and showing plainly the work of the crow, while on more than one occasion I have actually observed the offender carrying off the egg in his bill.

Several countrymen hereabouts have also complained of the crow in this particular, and on one farm not far from this village they were reported to have destroyed three sittings of "chicken's eggs" the past spring. The nesting cover for the grouse in this locality is rather scanty, and with the crows, minks, weasels and numerous hunters, the future outlook for their preservation seems altogether discouraging. The crow, in my estimation, far outnumbers all other evils combined. That all crows are equally addicted to this bad habit I really cannot say, but probably not, though from what we know of their habits in general it is questionable whether a favorable opportunity with a much-coveted meal like this would pass unnoticed, and when robbery is once begun, the nest is never deserted until the very last egg is gone. However, in the case of the robbing and killing of very young birds, nestlings and young of domestic poultry, individuality may cut some figure. This may be described as an acquired taste. An acquaintance of mine engaged in the poultry business and living close beside a piece of woodland tenanted by crows tells me that this is true. A crow one season robbed him of six young chickens and seven ducklings—the same identical crow whose nest, containing a brood of young,

hold a conclave. There would be anywhere from 5,000 to 10,000 of them, all of them cawing away at a great rate, when suddenly, as if by a concerted signal, every one of them would stop. Then one would apparently make his remarks, extending over possibly a quarter of a minute, after which they would go to work, all of them, discussing what he had to say. This will occur three or four times in the course of a half an hour. Then the birds, as if by some concerted signal, would start off in a certain direction. Some years ago we had a very cold winter there, and in this same woods I found hundreds of dead crows. The neighbors around the woods told me that they would find large numbers of them entirely blind that had not yet died. The crows had apparently had their eyes frozen so that the pupils cracked open, and they could not see; but they were not otherwise injured. I might say, however, that I never personally examined them to find whether the eye had been cracked in this way or not. Certain it was, there was a great mortality in the flock."

This same observation on crows becoming blind during exceptionally cold weather is also mentioned by Mr. Frank L. Burns, in Bulletin No. 5 of the Wilson Ornithological Chapter of the Agassiz Association, "The American Crow" (see page 11), as occurring during the winter of 1894 in Chester county, Pa. For a more detailed account of the economic habits and life history of the American crow the reader is referred to this bulletin, also to the exhaustive treatise prepared by Prof. Walter B. Barrow, and assisted by Mr. E. A. Schwarz, comprising what is known as Bulletin No. 6, U. S. Department of Agriculture, Division of Ornithology and Mammalogy, as well as to the very able paper of Mr. E. H. For-

A Four-Footed Architect.

WE were taking a winter walk along the bank of a frozen Connecticut stream, when my companion stopped and pointed inquiringly toward a dome-shaped mound of leaves rising perhaps 3ft. above the surface of the ice. "Oh," I said, "that's a muskrat lodge; let's go over and have a look at it." It was about 30ft. from the shore, at a point where the river was shallow and sluggish, and looked precisely like a heap of dead leaves, such as gardeners rake up on the lawn in the autumn. In reality, however, the leaves were not loose, but were cemented together with ice, and formed a substantial circular wall to the cozy little chamber inside. The foundation of the dwelling was on the bed of the river, about 1ft. below the ice, and the entrance was under the water. Had we broken through the walls, we should have found that they were still further strengthened by many dead sticks laid horizontally amongst the leaves. Inside we should have seen a small room with a leafy, shelf-like bed, built a few inches above the surface of the water, which formed the floor of the apartment. Here the furry owners slept in daytime, diving into the water at dusk, when they generally set out in search of food.

My friend and I now began to look for the opening in the ice through which the muskrats must come on their way to breakfast. We soon found it close to the bank, and from it a trail led up a little hill, through a hole in a stone wall into a corn field beyond. Here the trail divided, and the tracks of the little animals led out in every direction. Most of the corn had been carted away in the autumn, but many ears had been dropped or overlooked, and for these the muskrats evidently made nightly visits to the field.

Muskrats live chiefly on a vegetable diet, and have been known to raid barns in search of apples, turnips, corn and other farm produce. They are not very strict vegetarians, however, as their fondness for fresh-water mussels is well known, and the gnawed shells of these bivalves may be found along the banks of almost any stream where muskrats abound.

In appearance a muskrat is dark brown on the back and light brown, shading to gray, underneath. Each paw is armed with five substantial claws, suitable for making burrows in the banks of streams, where most of these rodents live in the summer, and many of them all the year round. The forelegs are short and the paws small, but the hindlegs, those chiefly used in swimming and diving, are provided with large, slightly webbed feet, set on at an angle and pointing outward. The tail is flat and knifelike, with the edges at top and bottom, and is covered thinly with coarse black hairs. It is nearly as long as the body. The head is ratlike, with a small, sharp nose and black, beady eyes. The front teeth are long and chisel-shaped; there are also grinding teeth at the back of the mouth. The ears, though in reality quite large, are so completely hidden in the thick fur that they cannot be seen without a special search being made for them.

The fur of the muskrat, though not high-priced, is handsome, and is often made up into garments either in the natural color or dyed to imitate a more expensive article.

ERNEST HAROLD BAYNES.

Two Ways of Killing Rattlesnakes.

THE following was related to me by Mr. Howard E. Case, of 92 Wall street, New York, who formerly owned a ranch in Texas:

We always killed a rattlesnake at sight on the range. We even went out of our way to kill him because of his destructiveness to sheep. Not that a rattler pursues them with murderous intent—nothing of the sort. He isn't a bad fellow in his way, no fighter except in self-defense, and always gives warning of his presence, so that you may take the other side; but when he is run down by a flock of sheep, and their sharp hoofs cut through his mottled hide, it is to be expected that he will strike back. When he does strike it is always on the under side of the jaw. If we see a sheep apart by itself, its under jaw so swollen that it cannot eat, we know what is the matter, and treat it accordingly.

"What is the treatment?" we ask.

"We take a leaf of the Spanish bayonet, which has a point like a needle, and thrust it into the jaw. A milk-white fluid exudes, and when this has all been discharged the animal recovers quickly."

As I was saying, we always kill the rattler on principle, but we never waste powder on him. Every ranchman in Texas carries a "quirt," a whip with an iron handle about 2ft. long, and a leathern lash about twice that length, and ending in three thongs. There is a loop attached to the handle, through which the wrist is thrust.

On seeing or hearing a snake, I would slide from Kintana—who hated the varmints as badly as I did, often discovering them where I failed, and who would remain perfectly still while I killed them.

The reptile on seeing me, of course, threw himself into his coil. I approached until within striking distance, whip in hand, and with a blow of the lash never failed to disable them, by breaking their backs. Then it was an easy matter to put my heel on their heads and grind them into the dust.

I remember one combat I had with a rattler, in which a different weapon was used. We were loafing along one moonlit night—Kintana and I—when we both heard the familiar rattle coming from a bunch of chaparrarrieta bushes, near the trail. The sound proclaimed it an old settler. I at once dismounted, but could see nothing, the moon having gone behind a cloud. I could hear the snake, however, and cutting a long switch from the bushes, went at it by the sound, and we had quite a battle in the darkness. By and by the moon came out, and then I quickly dispatched it. It proved a whopper, 6ft. long, with twelve rattles.

In my long, lonely rides over the prairie visiting the stations, I often had ocular evidence that another rattlesnake killer was abroad. More than once I came upon a circle of leaves of the prickly pear, or cactus, as it is called in the East, and in the center of it a dead rattler, often with the needle-like spines sticking in his body. For a long time I could not imagine what built this wall around the snake, evidently when it was asleep; but

THE MUSKRAT'S LODGE.

Photographed by Ernest Harold Baynes.

was near at hand. Others of his tribe associated with the poultry on the best of terms and apparently without any evil intentions. The robber and his progeny were destroyed, after which no losses from crows were suffered.

On May 21, 1897, I detected a crow in the act of carrying off a young robin, with the old birds in close pursuit. This is the only case of a robbery of this kind actually coming under my observation, though others since have been reported to me. Of several of our native birds whose eggs I have personally known to have been taken by the crow, the following may be mentioned: Loon, king rail, bittern, and (a rather remarkable incident to me at least) the entire settling of a pair of red-shouldered hawks, the shells of their eggs being afterward found on the ground beneath the tree, with punctures which clearly showed the crow's work. Previous to that I had observed that the crows harassed the hawks somewhat, but it never occurred to me that they really had designs upon their eggs.

This list might be materially increased by the addition of names of other of our wild birds whose eggs were known to have been broken and robbed under suspicious circumstances, but the evidence in their case is not quite as conclusive as in that of the foregoing. Crows must have greatly increased in numbers within this county during the past forty years, judging from the observations of William Le Baron, M.D., who, writing from Geneva, Kane county, Ill., a few miles west of here, under date of Dec. 12, 1854 (see Illinois Agricultural Report, 1855, p. 559), and speaking of other birds then scarce, but now common, has this to say of the subject of our sketch:

"The crow, which is so common and troublesome in the New England States, is rare at the West. It is only occasionally that we see them, and then only in small companies of less than a dozen." Now, it is not uncommon to see 100 of them together at a time; in fact, this is of almost daily occurrence during the winter months, as they flock to the northwest of here about the middle of each afternoon to a roost, as I am informed by Mr. R. P. Sharpless, of Chicago, a few miles east of Elgin. Of these winter roosts of the crow my correspondent, Mr. Sharpless, has given several interesting facts, from which I take the liberty of quoting the following in his letter to me under date of Dec. 9, 1898, viz.:

"For a number of years I lived down in Pennsylvania and found several crow roosts there, some of them of immense size. The birds in Bucks county, Pa., had a habit which I never saw anywhere else. They would gather in a large woods about two or three miles east of Doylestown, the county seat, and would apparently

bush, in Bulletin No. 4, series of 1896, of the Massachusetts crop report, all of which seem to draw the conclusion that the crow's usefulness in various ways is fully equal to, if not more than a counterbalance for, those qualities which are notoriously bad.

Inasmuch as a final decision has not been reached concerning the true value of these birds, would it not do to devote still more time to the nest-robbing side of the question? A chemical analysis of the stomach contents would perhaps give the best results, yet even this might be held as untrustworthy in view of the rapid digestion and assimilation known to take place with the crow.

How then shall we finally dispose of this much-vexed question? Perhaps some of our friends associated with the biological work of the United States Department of Agriculture can show us the way.

BENJ. T. GAULT.

Louisiana Winter Rail.

JEFFERSON ISLAND, La., Feb. 14.—I mail you to-day a Virginia rail, killed here by me this A. M. The whole country here is frozen up and about 2in. of snow. Thermometer yesterday at 7 A. M. 4 degrees. The rail was feeding in an open ditch near a cherokee hedge, with ice everywhere. This effectually tells where the rail birds go.

ROBT. C. LOWRY.

[The rails go south in winter like the other birds. We have seen them feeding among the reeds of North Carolina when the country was all frozen up. If the freeze lasts long, however, they move on to warmer climes.]

Wyoming Vermin Bounties.

MORGANTOWN, W. Va., Feb. 13.—*Editor Forest and Stream:* The last issue of the Grand Encampment Herald, of Grand Encampment, Wyoming, gives these figures, which may interest your readers: "During the past two years the State of Wyoming paid bounty on 13,326 coyotes, 4,281 wolves, of which number 3,493 were gray wolves, 19 black wolves, and 769 wolf pups. The total number of predatory wild animals on which bounty was paid during the two years just closed was 21,888."

I hope many of FOREST AND STREAM readers enjoyed the third part of "In Old Virginia" in Feb. 11 issue as much as I did. Never did I laugh so much at the reading of anything as that of the doctor and his buck. Such mirth provoking narratives add years to our lives.

EMERSON CARNEY.

at last I found out by happening along when it was being done. And what do you think it was? You would not guess till doomsday, so I'll tell you. It was a bird—one with as much brains and "horse sense" as some humans, I think. What in Texas we call a "road-runner," a bird with long, stilt-like legs, long wings, long beak and dun-colored plumage, that I've seen keep the trail ahead of my horse for miles, never once taking wing; hence the name "road-runner." For some reason the bird is the mortal enemy of the rattlesnake, and in its long journeys over the prairies keeps a wary lookout for its foe. I once had an opportunity, as before remarked, of seeing what it does on discovering him. Behind a little clump of sage bushes I heard the low, querulous note made by the bird when alarmed, and dismounting I crept up and peeped over. Sure enough, a road-runner had just discovered a rattler asleep in the sun, and was circling around it with drooping wings and neck distended. After a while it ran off a few yards to a prickly pear bush and quickly returned with a leaf covered with its needle-like spines, which it laid on the circle, and then continued the process until it had built a broad wall of spines around the snake. Then it flew over and let a leaf fall on the snake's back, which sprang up, only to impale itself on the spines. For several minutes it writhed and thrashed about, the road-runner meantime looking impassively on, until at last, stung to madness, it struck its fangs into its own body and died of its own venom.

CHARLES B. TODD.

[Mr. Todd sends us a letter written to him by Mr. Case, in which Mr. Case says: "The killing of a rattlesnake by a road-runner, as described by you, was witnessed by me during the year 1877, while driving sheep in Mexico, between the towns of Lampasas and New Laredo."]

Reason and Instinct.

SOME recent articles in *FOREST AND STREAM* under this heading and also of "Animal Intelligence" have moved me to "speak out in meetin'" and tell some yarns which bear on all these subjects. Without going to the dictionaries for definitions, I, very egotistically, prefer to give my own, just as though the subject was entirely new; even at the risk of being classed with those who are said to "rush in where angels fear to tread." Yet if a fellow has not the courage to do this there would be no chance for the other fellow to whack him, and what would Donnybrook Fair amount to without a fight? Man loves fight, the Peace Society to the contrary notwithstanding, and nevertheless, "It needs no ghost to come from the grave to tell us this," we see it all around, from the boyish snowballing to the desire for actual combat, either in war or in the prize-ring. When we are denied these outlets for our pugnacity we just sit down and challenge the other fellow to controvert our opinions in some publication. Here we always win, we being umpire as well as contestant, and that is satisfactory.

With this as a preface the ball is opened. Reason requires thought, and to think is the prerogative of intelligence, and there you are. There are plants so sensitive that they close their flowers at the slightest touch; the so-called "lower" forms of animal life, the sea-anemone, clam and oyster, will quickly shut up if touched, just as a man will shut his eye if it is touched or threatened, the instinct of preservation does it, because reason could not get there on schedule time, if it ever did. The young bee comes from the hive, circles about to get the bearings of its home, and goes to find honey and store it up for a winter of which it can know nothing. If it comes out early in the spring it works about three months and dies with its wings worn to tatters in providing food for a later brood, which will winter on the honey. That's instinct.

Instinct in Man.

Reasoning men do the same thing; I know hundreds of them who are to-day working to amass honey, for what? Heirs who will "blow it in" for what the father would never have spent a cent for, or to be wasted in litigation; they want their boys to begin where they left off; one in a thousand does it. That is instinct in the form of egotism. "My boy shall not grub as I have done," and he will not. Yet why shouldn't he? This question is an American one, and not calculated for the longitude of Europe and entailed estates.

Nine times out of ten the inheritance of large amounts of money wrecks a young man who might be well equipped for the battle of life but for this handicap; it thwarts nature's law of the survival of the fittest; he may have been fitted for the fight, but saw no reason for entering it when all that the battle offered was his alreadiness. Such cases are too common to cite instances. Why should a squirrel labor to gather nuts when his father has laid up a great store? The incentive to labor is necessity, and few men would work if this were not so. With the few who would it is the instinct of the bee; they must be busy; they cannot lie on the bank and sleep with a fish-line tied to a toe and await results. Those of our race who can do this are the happiest of all men. They have no ambition beyond the day, there is no nervous strain when stocks go up or down, and they are content.

Will you say that they enjoy a mere animal existence and have not reasoning powers, because they are ignorant of books and the stock quotations of Wall Street? Not a bit of it. Your Maine, Adirondack or Western guide seldom sees a newspaper and is content to live outside of our bustling civilization and can tell you the reason why he knows that a buck and two does crossed the trail within a few hours. His mind has had different training from yours and you are surprised at his knowledge. He can explain these things in your own tongue. Let us see how our friends who cannot speak, even if they sometimes try to articulate, communicate with each other.

How Dogs Communicate.

Shakespeare, who had a knowledge of the minds of men far beyond that of any writer before him, or since, said, "Winter's Tale," act v., sc. ii.:

"There was speech in their dumbness, language in their very gesture."

If those who deny reasoning powers to the dog can be pinned to Whately's proposition that "instinct is a

blind tendency to some mode of action, independent of any consideration on the part of the agent, of the end to which the action leads," then we have them where we want them, and having them there, let us "soc et tu 'em."

The man who denies reason to the dog has never trained or studied a dog; he has never seen the long-legged, big-kneed, awkward, slouching pup develop into the handsome, graceful, brainy hunting dog; he has never seen the pup that "cut his lucky" for the home headquarters at the first bark of a gun change to the dog that wagged his steering gear loose and threatened entire dismemberment of his spine in the excess of his delight at the sight of a shooting coat or gun; he has never seen the fool pup that would "set" nothing but a bone quarter in accurate lines against the wind and then, if working with the wind, go 100 yds. or more ahead and quarter toward his handler in order to get the wind; he has never seen the same flabby pup so develop in his knowledge of birds that he could, and would, with scarce a word from his master, hunt all of the likely places for birds, picking them "by instinct" (I don't think) with as perfect accuracy as does his master by the exercise of his reasoning power; he has never looked into the reproachful eye of a disgusted dog that has been holding a bunch of birds for him that he allowed to depart in peace because of the game law. To be sure, I never did own a dog that was properly impressed with the importance of the game laws, nor that was disposed to observe the same, but if this tendency to ignore the game and fish laws was made a *prima facie* case against the possession of "reasoning power," an immense number of our so-called sportsmen would have to prove an alibi or be left with nothing but instinct with which to furnish their mental garret.

No man who has worked dogs in the field can believe that the fine points of finding and retrieving game by the bird dog are but "blind tendencies to some mode of action, independent of any consideration," on the part of the dog, "of the end to which the action leads." He knows that the dog works it out in his brain.

A ravine filled with a tangle of grapevines, blackberry briars and other wild growth ran back of my garden. In the garden was a low trellis, about 1 ft. high, over which trailed a thick growth of dewberry vines, the running blackberry. Each year a rabbit came and reared her young in the garden, nibbled the cabbage and turnips a little, and I had great fun in watching the family at play, chasing each other and having a grand romp when my terrier Joker was in the house; and there was never a cat allowed on my place. Joker also had his fun with the rabbits at times, and they seemed to like it, for they felt secure in their briery strongholds. Knowing that he could not catch one, I let him go it. One day I watched him a long time, up and down the rows of corn, among the tomato vines, jumping in the air occasionally to see better, and yelping with excitement. He stopped, looked at the vines where possibly he saw or smelt the game, and trotted off to the hatchery and I followed. He hunted around, asked to have the door opened and found the foreman's dog Rush asleep in the workshop. Joker pulled his ears, danced about, trotted off and looked back with a bark and a "wig-wag" until Rush understood, arose, stretched and followed Joker into the garden; thus reinforced, they dug under the dewberry trellis and drove the rabbits from one cover to another. Knowing that they could not hurt the bunnies, I let the dogs have their fun and exercise. Did Joker ask Rush to follow him, and did Rush understand? I think so.

In the early 50's I was in the lead mines at Potosi, in the southwest corner of Wisconsin. My partner, Charley Guyon, was at the windlass and I was in the shaft with pick and shovel. I heard a dog barking, and soon Guyon called out: "Come up; there's a fool dog here acting queerly and I can't drive him off." I got into the bucket and went up. The dog was a small one of that short-haired, no particular breed called a "fice" by the French Canadians, of whom Guyon was one. The dog turned his attention to me, barked at my face, pulled my trousers, went a few steps away, barked and "wig-wagged." "Charley," said I, "this dog wants us to follow him; he's got a rabbit in a hole or there's trouble somewhere."

"No," he answered, "that's a fool fice that belongs to a man named Johnson, over in British Hollow; he was here yesterday when it was your turn in the shaft, and he's chopping off west there, somewhere."

All this time the dog kept pleading with us to follow him, and I told Guyon: "That dog wants us to go with him, and I'm going." We went, the dog in the lead occasionally turning back to see if we were following, and expressing approval with his tail. A tramp of about a mile brought us to a clearing, and there was Johnson, pinned under a fallen tree, with a broken leg and internal injuries from which he died a week later. Did that dog reason that his master needed the help which only men could give, and did he come to ask us to give that help? Instances like these could be multiplied ad infinitum.

Memory in Fishes.

While the possession of memory does not necessarily imply reason, it is a quality that may be transmitted, especially that of fear, which becomes caution in the young. Fishes are near the bottom round of the ladder in animal life and intelligence, as we regard it. They have not the sensitiveness of some reptiles and do not compare with the frog in nervous organization, yet they have a brain, which must be of use in selecting food and avoiding danger.

I made an assertion to the effect that a fish that had been hooked might transmit caution to its progeny—*FOREST AND STREAM*, April 9, 1898—and this statement was followed by columns of argument by Col. E. P. Alexander, "Hermit," "Coahoma" and "Von W." Having stirred up the fight I sat like the red-headed boy on the rafters, and enjoyed the scrap, but never "took sides." Let's see.

Col. Alexander says: "The fish pricked with the hook rarely seems to mind it. He is ready to bite again in five minutes. He has no clear conception of man and his works, or that he has escaped a great danger."

It is true that a hook causes a fish but little pain, and that if it escapes easily it will often bite again. But it is not the hook that the fish dreads so much as the pro-

longed struggle while held fast, and if it breaks away in sight of the landing net it has learned something; a few repetitions of this will be so impressed upon it that it will be cautious, and mental qualities may be transmitted as well physical ones. In proof of this, let's take the trout in different streams. Most anglers have found trout waters far away where the trout were so innocent as to vie with each other in their haste to take anything like a fly, and where angling seemed merely trout murder, no excitement; no wondering if the cast would bring a rise. The result was sure. Fear and discretion were unknown to the fish.

Then take the trout of Castalia Springs, O., of Caledonia Creek, N. Y., and of some Long Island waters, and note the difference. Unless the fly is about right in size and color and is presented in an attractive manner on the proper day, or time of day, the angler might as well reel up, for hardly a yearling will notice his cast. On Caledonia Creek, some fourteen miles south of Rochester, a man might fish a week with the large flies used in the Adirondacks and not get a rise. The stream has been whipped for over a century by the best of fly-fishers, and all the rash trout have been caught out, and only the cautious ones left to transmit their caution. That's heredity.

There seems to be no other hypothesis to account for the wariness of trout in well-fished streams except the experience of ancestors handed down in the quality of fear. It may not be reason in the case of trout; call it instinct, if you will; but the thing is there, as thousands of fly-fishers will attest. The "instinct" which teaches all wild animals to shun man and his lures does not exist in the trout, which live where man seldom comes; they welcome his artificial flies with open mouths at first; but, twenty generations later, they are more cautious, if man has persistently sought their capture. If their forebears did not reason they had memory, and memory presupposes thought.

What the Birds Think.

Col. Alexander says: "For every wounded bird which survives and has further progeny there are hundreds unhurt to whom the explosion of a gun was, after all, only a harmless sound, and one which in certain circumstances they will easily come to disregard entirely. Birds and fish do not know what death is, nor do they figure out that missing ones are dead. The whole conception assumes for all animals reasoning powers which thousands of more conclusive phenomena show that they do not possess."

Perhaps fish may not know what death is, but a bird has a higher intelligence, and when it sees its companions stricken down and perhaps feels the stinging shot, it is not for man to say that it draws no conclusions from the flash and sound of the gun, and the glimpse of a man behind it. Once the Indian could kill birds and animals with his arrow and they knew the range of its power and kept just out of it. Then the white man came with his musket, good for 75 yds. with ball or 20 with shot, and the wild creatures became wilder, and now the sight or scent of a man a mile off alarms some of them. Is this an instinct implanted in the first deer or is it the education of the species through heredity?

My young wood ducks, hatched in confinement, feared man, dogs, cats and hawks, but would betray no fear of a cow, sheep or horse. This looks to me like an inherited trait from ancestors which had learned to fear man and was probably instinctive in the young.

Crows communicate with each other, as their various notes show; let one give the "look-out" call from a tree while others are feeding on the ground, and see the result. A crow not only knows the language of its kindred, but it also knows all the talk of the woods. A squirrel may rustle leaves or give its cheepee call and the crow pays no attention; but let little bushy-tail begin to cough and bark at something which he regards as an intrusion and the crow takes a position where he can observe operations with safety to himself. Let some blackbirds have an owl at bay in a bush, in daylight, and the crow knows their language and is wise enough to keep out of that scrapping match, for he has known blackbirds to persecute a poor crow for just taking a few eggs, when there was no evidence that one egg belonged to the persecutors.

The crow is a wise fellow. He has lived in his native land, where the hand of every boy and man has been against him, and where the so-called game birds have been killed off. Crow is not a marketable bird; men are said to have eaten it, but "not to hanker after it," but if the bird was edible and considered "game" he would not be exterminated in settled places as the grouse has been—he knows more than the grouse.

Unless when driven by hunger in winter to feed in barnyards let the man go forth to shoot the crow. He would not get one in a month, unless by accident. It has been shown that the crow can count up to five when that number of men have gone into a blind and only four have come out, and the bait was in range of the last man's gun. The crow knew that there was a man missing.

Let the deer-stalker follow his game with the wind in his face until he is near to it and then hear the alarm note of the crow; he then knows that his game is alert, as the deer knows crow talk and is off. This looks like reason on the part of the deer.

How the Rat Adapts itself to Changes.

Let's take a look at our unwelcome guest, the rat. Does he reason? I'm sure he does. Laying aside the more or less probable yarns about his getting molasses from a jug with his tail and other stories, here are some facts: Modern builders and householders have fought the rat and tried to deprive him of food and shelter in the land where he was born and where he may consider that he has some rights to life, liberty and the pursuit of happiness. They have put obstructions in the way of the rat that might have discouraged our feeble native black fellow, who was driven to the wilderness years ago by the formidable brown or "Norway" rat, which is now a resident in every land where ships go. He is the "fit-test," and he "fit" all other rats out of business. He is sagacious and can reason; a living example of physical courage and brain power. He knows no instinctive rou-

tine life, such as a bee leads, and rats rise superior to their environment at any time when the environment proves to be a misfit.

The brown rat, like the old sailor, has adapted himself to steel ships and is at home in them, but it is in the cities that he gets in his fine work on gas fittings, lead pipes, cement floors and brick drains. He chews cement floors in the weakest places and he taps leap pipes for water. "Sewer rats" have achieved a reputation on parallel lines with sanitary plumbing, and under the New York end of the great Brooklyn Bridge rats are earning a frigid living in the cold-storage warehouses and sharpening their teeth on frozen fish and game where a man's breath will turn to snow on a summer's day. He is enough of a philosopher to take life as he finds it; he is a genuine "man of the world."

As the burglar keeps abreast of the safe-maker, so the intelligent rat steps to the march of civilization and cold storage. This is not "instinct," it is the result of thought, and thought implies reason.

Another Dog Reasons.

A dog is moved by instinct to withdraw his foot from a coal of fire, and does it before he can think of it; a man does the same. A man reasons that a pole across a stream may break and let him down; an elephant plants one foot to test a bridge, reasoning that it may not bear his weight. The dog, in its highest form, the most intelligent of all animals except man, reasons out a whole lot of things which he cannot explain and which only those who love and make companions of dogs ever have an idea of. Bungo, an intelligent cur which I had on my farm in western New York to keep down rats, skunks and other vermin, always wanted to go on fox hunts with my hounds, but was not wanted because he was liable to head off a fox. He was shut in the barn and the two hounds were taken. It was winter and Mort. Locke and I were going to the Mendon Ponds, south of Rochester, some ten miles away. Mort. was at my house with his hounds, and I piled a lot of straw in the wagon, put the hounds in, and off we went.

At the ponds we stabled the horses and put out the hounds. About two hours afterward Bungo came to me, crouching and begging not to be punished. He was a short-haired dog, but was wet with perspiration. This was what I learned: Four hours after we started he was let out of the barn; he went a mile east to the village of Honeoye Falls, to Mort's house. Then on two miles south to the "Parker Boys," men sixty to seventy years old who hunted with us sometimes, but we had gone north from my place.

The dog had gone a mile east and two miles south, to my usual haunts when fox-hunting. He cared nothing for the sport, but may have been jealous of the hounds and wanted to be near his master. "Frank Forester" said: "Man is the God of the dog," and Bungo was jealous and wanted to be the sole pet. Three years before he had gone to Mendon Ponds with the hounds. I believe he reasoned it out in this way: "Master is running foxes; he has not stopped at Mort. Locke's and has not been at the houses of the Parker brothers; perhaps he's over at the ponds, where he went before, and I'll try it."

He reached us in two hours less time than the horses made and traveled six more miles, doubling the first three. The dog thought it all out, and if there is any difference between thought and reason it is too subtle for my comprehension.

As I understand instinct it is independent of thought. The horse which lifts a latch to let him into a gate or a pasture has figured it all out in his brain, without a blue print, and that is reason. When an animal flinches from physical pain that is instinct, and there you are; but when my dog has thought, "My master is not at this place, where he often goes, nor at another, perhaps he may be where he went three years ago, because he had foxhounds with him," and then follows this line until he finds me, there is no "instinct" in it.

"Von W." covers the ground of the fear of man by animals, based on their experience and the transmission of that experience to their young, and this is what all observers have seen. The late Dr. Romaine proved to the satisfaction of many, myself included, that the mind of a dog differs from that of man simply in degree and not in kind. The power of speech and thereby the transmission of intelligence of an abstruse or abstract nature gives man the power to argue questions and explain his individual views, and he uses it to its full capacity. The dog, having no speech, cannot hand down legends of his race nor of his personal experience. His acquired knowledge dies with him.

The ability of dogs, cats and horses to return to their old homes from long distances and across a country unknown to them may be termed instinct. In the case of the homing pigeon it is memory, for they often get lost if they lose their bearings; still with all these animals there is a mental process which may not be far from reason. Perhaps it may be that subtle "sense of direction" which some men seem to have.

Communication among Animals.

We, who notice such things, have seen ants meet and spend some time in exchanging touches with their antennæ, and we never doubt that they are conveying intelligence in some kind of sign language. Beavers have some sort of signals made by flaps of the tail on water. My Longfellow is not at hand, but I remember of Hiawatha that "of all the beasts he knew the language," if those are the words, and there is truth as well as poetry in it; for we know what the muskrat means by its "smacking" at night, and we've heard the red-headed, the golden-winged and the big ivory-billed woodpeckers drum on dead stubs and on barns where there were no grubs, apparently for the music or the fun of the thing; but when they stopped to listen for a reply, we knew that it was a telephonic arrangement beyond our ken.

Men know by the voices of their hunting dogs what the game is, provided they have hunted with those dogs many times and are observant. I have spoken of Joker, a skye with enough Scotch in him to be an active ratter; I had at the same time a fox terrier named Trouble, and while living on Long Island I used to let these dogs out about midnight before retiring. The rascals were as good for cats and possums as for rats,

and they would circle the garden, and if there was no game would come back; but they usually put up something. Sitting in my den I could tell by their voices if they had a cat or a 'possum in a tree. I can't explain the different tone they used any more than I can tell how I distinguished the tone of a banjo from that of a guitar, but I did. If the animal was a cat I stepped on the back piazza and ordered them to come in; if it was a possum the lantern was lighted and down I went. When they saw the light, which meant reinforcement, they would yell with delight, and keep it up all the while the pear tree was climbed and the tail of Misser Possum was uncurled from the limb and he was brought down to be put in a barrel for a festive dinner on Staten Island, or to be given to some colored man.

I believe that those dogs changed their voices in order to tell me "cat" or "possum," for they knew more than some men I have met who could yell those names loudly. They reasoned that these different animals must be known to me by different names, just as different dogs were, and they tried to tell me those names. It is too much to expect that all readers of this will agree with my conclusions, and I only ask them to believe that I believe that animals can reason.

FRED MATHER.

Services of Familiar Birds.

VERY interesting observations on the food of two of our most familiar birds have been carried on at the Agricultural Experiment Station of New Hampshire College by Dr. Clarence M. Weed, the entomologist of the station. The birds discussed are chickadee, one of our most common winter birds, and the chipping sparrow, which is a summer resident as well known.

Throughout New England and the Middle States, the chickadee or black-capped titmouse is an abundant winter bird and may often be seen in the woods or along the hedgerows hunting for food. Dr. Weed's studies were carried on for the purpose of determining what this food is, in order that the economic status of the bird might be more definitely determined. The results of these studies prove that more than half of the food taken by the chickadee during the winter months consists of insects, of which the greater portion are taken in the form of eggs. Vegetation of various sorts contributes a little less than one-quarter of the food, but of this two-thirds consists of buds and bud scales, which are believed to have been taken in accidentally along with the eggs of the plant lice. In the specimens examined, these eggs made up more than one-fifth of the entire food, and as they are usually taken from crevices beside the buds of deciduous trees and shrubs, it must commonly happen that the bud scales are to be pecked away before the eggs can be got at, and in devouring the eggs a large proportion of such scales might very well be swallowed.

By this destruction of the eggs of the plant lice which infest fruit, shade and forest trees, the chickadee no doubt renders to man its most important winter service. Dr. Weed's record shows that more than 450 eggs sometimes occur as the food of one bird for a single day, and if we imagine that 100 eggs were eaten daily by each one of a flock of ten chickadees the destruction would amount to 1,000 per day, or 100,000 during a single winter, a number probably far below the truth. The multiplication of the aphides is wonderfully rapid, each egg hatching into what is known as a viviparous female, which gives birth to living young by a process similar to that known as budding among the lowest of animals. Each of these young soon gives birth to others, which in turn mature and produce still others. So enormously rapid is the increase that were it not for the numerous checks upon these insects found under natural conditions, the practice of agriculture would be in vain and all plant life might be destroyed. The subject is a familiar one to the lover of plants.

Besides the eggs of aphides, those of many other sorts of insects are found in the chickadee's food. Those of the tent caterpillar and of the fall canker worm were common, as well as the larvæ of several sorts of most injurious moths, such as the common apple worm and the larvæ of the codling moth. Bark beetles, so destructive to our forests, are also eaten by wholesale. On the other hand, the eggs and adults of some spiders are eaten, creatures which, on the whole, are beneficial rather than injurious. The summary of these observations shows the chickadee to be one of our most useful birds.

In order to get some notion of the abundance of this species in a region like southeastern New Hampshire, where a considerable portion of the land is wooded, Mr. Fiske, Dr. Weed's assistant, made some observations in the woods and fields, recording the number of flocks of chickadees seen and the size of each, and observing also their feeding habits. In a territory estimated as four square miles, eleven flocks were noted, varying in number from four to forty, but averaging about thirteen to the flock. This would place the number of birds for each square mile at thirty-five.

Dr. Weed remarks on the desirability of inducing these useful birds to remain upon the premises, where their services in destroying insect enemies will abundantly repay the slight trouble required to keep them in the vicinity. The subject is one that has often been brought up in *FOREST AND STREAM*. Mr. Fiske calls attention also to the practice by the chickadee of carrying away surplus food, which they hide in crevices in the bark or at the base of twigs in neighboring trees. Mr. E. H. Forbush, in the Bulletin of the Massachusetts State Board of Agriculture, has also called attention to the value of keeping the titmouse about. In an orchard in Massachusetts canker worms had been very abundant the season before, and the moths of the fall canker worm had deposited great numbers of eggs upon the trees. Pieces of meat, fat and bone were fastened to the trees at the beginning of the winter, in order to attract the chickadees, which came and remained all winter about the orchard. By watching them, it was learned that they were feeding on the eggs of the canker worm moth, and a few birds were killed to determine the number of eggs eaten, which was between 200 and 300 for the stomach of each bird. In the spring the female moths of the spring canker worm were also devoured by these birds. As a result of this course, through the labors of the chickadees and such other birds as feed on these injurious in-

sects, the orchard was saved from any serious injury by the canker worm.

Dr. Weed's observations on the feeding habits of the chipping sparrow cover another season of the year, and were made by himself and Mr. Fiske during one long day in June, upon a family of sparrows which had three young ones so nearly full grown that they hopped out of the nest the second day after the records were made. The observations continued for sixteen hours, from 3:40 A. M. to 7:50 P. M., The birds were fed first at 3:57 A. M. and last at 7:36, and during the day 200 visits were made to the nest by the parent birds, which brought food at nearly every visit. The most abundant elements of this food seemed to be soft-bodied caterpillars, but crickets and crane flies were also identified, and there was much other food, the nature of which it was impossible to determine. It would thus be hard to overestimate the usefulness of this little bird at a season of the year when all insect life is especially on the increase.

The observations recorded appear to have been made with extreme care and thoroughness, and are very creditable to Dr. Weed and his assistant, Mr. Fiske.

More about Skunks.

Editor *Forest and Stream*:

Perhaps I may add a few bits of information to those that have been given in your columns on skunks. I have no experiences of my own to narrate that are not familiar to every country boy. Such experiences as holing a skunk when possum hunting at night, and setting the greenhorn of the party to "punching him out," are familiar to all possum hunting boys. But a few years since I made a very thorough investigation of that curious delusion that the bite of a skunk would produce rabies, regardless of whether the skunk was rabid itself, and in this investigation I came across some rather peculiar bits of information. Dr. John H. Janeway, then a surgeon in the United States Army, stationed at Fort Hays, Kansas, made a very exhaustive report of the short-lived epidemic of rabies in Kansas and Northern Texas in 1873, dogs, wolves, skunks and even hogs being affected, and deaths having resulted from bites of all these animals; the peculiar feature being stated by Dr. Janeway, that a rabid skunk invariably lost its power of secreting (or discharging) its odorous fluid. This Dr. Janeway states as demonstrated beyond doubt, and in view of his singular care and exactness in all his statements it must be accepted as conclusive.

I found that in southwestern Kansas, not remote from the Fort Hays locality, skunks are kept as family pets, first having the odorous fluid secreting glands removed, and in Mississippi they were often confined in various rat-infested buildings as vermin killers.

I found two instances of illness resulting from skunk bites, in one of which the bitten person recovered after copious blood-letting. In the other case, the victim went into a slow decline, dying a year after; of course neither of these cases were rabies, and Gen. Sternberg, Surgeon-General United States Army, wrote me that blood poisoning was undoubtedly the cause of the troubles.

W. WADE.

OAKMONT, Pa., Feb. 15.

The Range of the Eastern Elk.

THE recent discovery of a remnant of elk in extreme eastern Quebec is an event worthy more than passing note. Unless the species has recently been reintroduced the specimen to be shown at the Sportsmen's Show next March is the second known specimen of the Eastern elk, the other specimen being in the Philadelphia Academy of Sciences.

If any reader knows of any other specimen heads, hides, skulls or horns of elk taken in the Eastern States or Canada he can confer a benefit on science by recording them in *FOREST AND STREAM*.

According to Caton the elk was once found in Nova Scotia, New Brunswick and Labrador. If any reader can give any new records to prove this great range or refer to sources of information, I shall be glad to hear of it.

Although the former range of the elk is given in general as "entire United States," I do not know of any proof that it was ever found in the limits of the present State of Florida. Does any reader know of any horns that have been dug up in that region, or indeed of any proof, material or legendary, of former occupation by the elk?

ERNEST SETON THOMPSON.

A Maine Winter Robin.

JACKMAN, Me., Feb. 9.—This is the coldest snap of the winter, the temperature ranging from zero to 20 degrees below since Jan. 27; yet on Feb. 6 a robin appeared in camp, rested on a tree for a moment and then flew north. It does not seem probable that this bird came from the South, and yet this is the only robin I have seen or heard of in this region during the winter.

There are several large deer yards in the vicinity of camp, and so far they are all doing nicely, and were all being killed by the lumbermen or anyone else in this section. Partridges are quite plentiful, and are also wintering well, although now and then I find where a fox caught one in the snow, however, if the strychnine holds out their troubles on this account will be reduced considerably.

WILLIAMS.

A Stray Wild Pigeon.

BALTIMORE, Feb. 17.—*Editor Forest and Stream*: Apropos of the passenger (?) pigeon, I inclose clipping from the Lititz Record, a newspaper published in Lititz, Lancaster county, Pennsylvania: "During the cold spell last week a stray wild pigeon came to the farm of Henry Bomberger, northwest of Lititz, where it found lodging under the forebay, and where it has remained undisturbed ever since. No doubt it became separated from a covey of its kind, and getting lost, sought shelter at the nearest place." This is surely a belated passenger.

E. S. YOUNG.

THE *FOREST AND STREAM* is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

Game Bag and Gun.

Proprietors of fishing and hunting resorts will find it profitable to advertise them in FOREST AND STREAM.

March 2-15.—National Sportsmen's Association Exposition, New York.

The Colorado Game Law and New Departures in Protection.

DENVER, Feb. 4.—*Editor Forest and Stream:* As requested by you, I submit herewith some observations on the most radical changes from existing laws, found in the game law drafted by me and now pending in the Legislature of Colorado. These, with the synopsis of the bill published by you Dec. 31, will give a fair idea of its scope. The most radical departures are:

1. The hunting license feature, whereby every hunter of protected game must procure a license having three coupons, one of which must be attached to every game quadruped killed. By this means every animal is identified with and traceable to the person who killed it, and every animal without a coupon attached is contraband. This feature has been objected to as an importation of English methods and foreign to American ideas. The objection is prompted by selfish motives and lack of information rather than patriotism. The mere fact that a thing is of English origin cannot make it per se objectionable, as the great body of our common law, employers' liability and coal mining acts came from England, to say nothing of much of our early blood. Usefulness and not origin is the test of desirability, and licenses are as essentially American as anything we have, and are required in professions and business callings without number. The purpose of all licenses is two-fold, viz.: To produce revenue and enable the Governmental authorities to control and regulate the business, and they are especially adapted to an effective administration of game laws.

It being fundamental law that the game and fish in a State belong to the State, the same as its land, timber, etc., and held in trust for the people, the State has a right and it is its duty to enact regulations in relation to their acquisition, as no one person has a right to appropriate either ad libitum. Hence the State, when disposing of its land by lease or sale, rightfully exacts from those who desire to acquire it some compensation for the special privilege thus obtained. This is fair to those obtaining the privileges as well as to those who do not care to have them, and yet have an interest therein as citizens of the State.

The same principle is applicable to the game, for if left to the unrestrained desire of the few they alone will be benefited, and that temporarily only, as it will soon be gone.

Those opposed to game laws are either selfish or short-sighted. A widespread but altogether erroneous idea has prevailed that game laws are for the benefit of the rich. This is more or less true as to older European countries, as there the land on which the game is is all privately owned, and on it the non-owner has no right to go. This practically gives a game monopoly to the landed proprietor. This is the origin of the prejudice against all game laws, and is an English idea. The very reverse is true in this country, where nearly all the game is on public land, on which all have an equal right to go, and the average man has the same opportunity as the rich one to kill game while it lasts. If game would last without protection no laws would be needed. But as it will not, its protection is more in the interest of the average man and the poor man than the rich, for the reason that when game is scarce or gone in any particular locality the rich sportsman can board a train and go to British Columbia, Alaska or further, where game is abundant, while the poor man, when his local game is gone, has neither the time nor means to go where it is. This is obvious, and it is also true as to laws prohibiting the marketing of game, as it is already so high as to be beyond the reach of the average man. The only remedy left for him is the protection and preservation of game in every locality where it exists, that he may have it within reach, and he, above all others, should not object to paying a nominal sum for a license the principal purpose of which is to restrain and identify the market-hunter, rather than to burden the legitimate sportsman.

These licenses are not issued by justices of the peace, but by the commissioner or a county clerk, and are all furnished by the commissioner, numbered and having his facsimile signature thereon, and on each coupon, so that there is no chance for counterfeiting or duplicating. All unused licenses, with a report of those issued, to be returned to the commissioner at the close of the season.

I believe this license feature to be worth more for the protection of game against illegal slaughter than anything yet devised, and that it will before long be universally adopted. The opposition to it comes chiefly from unreasoning prejudice or the game hog. The bill referred to does not discriminate against the non-resident as to cost of license, as I believe such discrimination unfair and of doubtful validity. Instead, it provides a small export fee, which touches the non-resident only in case of success in hunting and a desire to take game out of the State, and this, I think, no one will object to.

2. The permission for cold storage of game. The opposition to this will come from the sportsmen. Not, however, from selfish motives, but from an honest belief that it will furnish an avenue for the illegal sale of game.

As game laws now are, this would be true, but it is not true in connection with the license feature. Every coupon bears the date of killing, the name of the licensee and the number of his license. The sale of domestic game being prohibited, the storage must necessarily be for the person who killed the game or his gratuitous donee, and it can never be very difficult to ascertain who the storage is for. Besides, as there are but three coupons to each license and the coupon must remain with the carcass of a quadruped until prepared for

consumption, there is little chance for using one twice, and detection forfeits game and license as well, and renders the party punishable. The limiting to three animals leaves no margin of profit to a market-hunter.

As to birds and fish, they can only be stored, in the first instance, during the open season and for five days thereafter when presented by one lawfully in possession. If it is desired to continue them in storage after that, application to the commissioners and satisfactory proof must be made of lawful possession and storage permit obtained for a longer period to be therein named. The person for whom the storage is allowed is also named in the permit. The chance for unlawfully killed game to be held in storage without detection is thus reduced to a minimum, while at the same time a fair opportunity is afforded the lawful sportsman to utilize his kill.

As most game laws now are, a man who kills a deer the last day of the season must swallow it whole that night, as he can neither lawfully ship or have it in possession the next morning, and five days' leeway, as some laws allow, is insufficient to permit lawful consumption.

As a matter of right, I think one who lawfully kills game should be allowed full opportunity to utilize it as he may desire and when he desires, if such privilege can be given without impairing the efficiency of game protection, and this, I believe, can be done under this bill.

3. The private propagation of game and fish. Believing that this should be encouraged as perhaps necessary for the final salvation of the game and fish, and in any event a meritorious business, the bill contains provisions allowing wild game and fish to be procured upon permits issued by the commissioner, and kept in parks and lakes for propagation and sale under restrictions.

4. Taxidermists are required to procure licenses, as through their hands passes a large proportion of the hides and heads of unlawfully killed game. They are forbidden to receive or mount any specimen of a game quadruped not having a hunting license coupon attached, and the coupon must remain attached to the specimen.

D. C. BEAMAN.

The California Fish Commission have written to Mr. Beaman regarding the measure prepared by him: "It is certainly the most comprehensive measure for the protection of game that we have seen. It seems to be flawless. We wish our people were advanced enough to adopt it. It is too advanced even for many of our hunters—all of whom style themselves 'sportsmen,' and many of whom are out for every feather in sight. However, they must all come to it, and we must continue the campaign until your measure is the law of the land. Let us pray that that may be before all our game has gone. We shall watch your fight in Colorado with interest. We wish you success."

Moose and White Sheep Trophies.

WM. W. HART & Co. have received a remarkable shipment of game heads from the Cook's Inlet country of Alaska. It includes the heads, horns and scalps of twenty-two moose, nineteen sheep and one caribou, as well as the skins of two sheep for mounting entire. The moose were all old bulls. The horns are unusually massive, and range in spread from 4ft. to 70in. Each set has interesting individual peculiarities, and some of them are very remarkable. One head has three distinct horns, two on one side and one on the other. The single antler has ten points, while of the other two, which lie in horizontal planes a few inches apart, the first has nine points and the second seven. The freak may perhaps be described as a doubling of the antler on the left side of the head. The beam shows indications of branching soon after leaving the skull, but the actual bifurcation does not commence till a distance of 10in. is reached. At this point the horn separates into two perfect palmated blades, of the normal type.

Some of the horns exhibit the fluted form which is a peculiarity of Alaska specimens, and one set is remarkable from the fact that the outer half of the blade bends vertically upward at right angles with the other part of the horn. Some of the shell-like hollows in the blades would hold several quarts of water. Many of the horns have another peculiarity which distinguishes them from Eastern moose, in that the first brow tines are frequently divided into two or more points. In one set the single tine branches into four points at its extremity. The horns and cleaned skulls are intact, and the skulls have not been split for convenience in shipping. The sets in this form are very heavy, and are estimated to weigh from 75 to 100lbs. apiece. The size and strength of the bulls carrying these antlers must have been prodigious, and the size is further attested by the length of the scalps, which measured from nose to brisket run from 5 to 6ft. in length. The scalps are all decidedly gray in color, and this is another distinguishing characteristic of the great Alaska moose.

The caribou in the collection has long slender antlers, similar to the European reindeer. The resemblance is so marked that it is just possible the head may have come from one of the domesticated reindeer imported by the United States Government, to be used in carrying supplies to the destitute miners on the Yukon. These caribou were last seen near the mouth of the White River in December, after their overland journey from the coast. The Laps who accompanied the herd reported that they had been obliged during the summer of 1898 to take a circuitous route, keeping near the summits of the highest ranges in order to escape the flies, and also to procure the kind of moss required for the caribou's sustenance. A large proportion of the herd had died, and it was conclusively proved that the reindeer were a dismal failure as regards the purpose for which they were imported. When last seen they were drawing sleds, though a miner who reported having met the herd earlier in the season said they were then carrying packs. This man came very near shooting one of the reindeer, thinking they were wild animals, and it seems very likely that some have wandered off and were killed by hunters.

The sheep in the collection are very beautiful specimens. The horns have a waxy whiteness very different from the dull brown of the Rocky Mountain big horn, and they are very long and very slender in comparison. The curve is more complete, and many of the horns make

something more than a complete revolution, and point toward the tail of the animal, instead of toward its nose.

No measurements have as yet been taken of the horns, but the length as a general thing appears to exceed that of the average Rocky Mountain sheep. The white hair contrasts well with the buff of the common sheep, and the sportsman who can hang the two heads side by side has trophies of which he may well be proud. One of the Alaskan black sheep found further south about the Stikkeen would add still more to the effect of the collection.

J. B. B.

The Lacey Bill.

National Game Reservations.

NEW HAVEN, Conn., Feb. 11.—*Editor Forest and Stream:* If I may be allowed the space in your columns I would like to reply as well as I can to Mr. Childress' question in regard to where the Fish and Game Commission proposed in Mr. Lacey's bill would obtain live wild birds for breeding purposes. But even if the Commission could do nothing in this way I do not admit that all further consideration of the bill would be idle, for I would put at least one of the other ways in which the Commission could assist in the work of game protection ahead of it in practicability and in promise of successful results.

It is safe to say that there will be people willing to engage in the work of capturing live birds if they can obtain reasonable compensation for doing so. This is an art that has not been much practiced in this country, although it is carried on to a considerable extent in some other parts of the world. I do not anticipate the Commission would find it impossible to obtain enough of the North American varieties that there is any prospect of propagating in this way. Among our native birds this list is not a long one, but there are certainly some foreign kinds that would make valuable game birds if introduced into the right localities. What species these are, and where to introduce them, can only be determined by experiment. Living birds of a number of foreign kinds can certainly be purchased. Neither do I see why any of the States should wish to put any obstacles in the way of the Commission, which does not propose to usurp any of their powers, and would work toward the same end as their own game laws. From some of the States it might receive much assistance, and I think a large majority would so modify their laws that its authorized agents could obtain what birds it needed for breeding purposes, by the time it got ready to undertake the work. Hostility or indifference to game laws is usually caused by unwillingness to submit to any personal inconvenience or deprivation, or to incur expense, rather than because they would not like to have the game preserved from extinction. Mr. Childress only weakens the effect of his objections to the bill, which have a reasonable basis, when he supports them by others, which on the face of them are purely imaginary. Where, for instance, is the State so jealous of its rights that it will not allow the national Government to liberate game birds within its territory? No doubt some States would neglect or even refuse to give them proper protection, but when this proved to be the case the Commission would distribute its favors elsewhere.

I would like to say a little more about game reservations, by means of which the proposed Fish and Game Commission could probably do more than in any other way, and without interfering with any State laws.

Now, the word reservation probably calls to the mind of many people something like the Yellowstone Park, covering a large extent of territory requiring a large force of wardens or troops to guard it, and entirely incompatible with the thickly settled condition of the greater part of our country. But I think what is wanted for the preservation of feathered game is not a small number of large reservations, but a large number of exceedingly small ones. When we set one apart for the protection of such wildfowl as ducks and geese, there is no sense in including a large area of upland pasture or dry woods or brush. Only the pond or marsh where the birds are found need be set aside, or if it is a large one only the part of it they most frequent, with enough of the banks of the same to prevent their being disturbed. If there is any money left over it would be far better to spend it on another somewhere else, rather than add land which the birds will not inhabit. One man could generally look after such a preserve, and on account of their small size many of them could be set aside in various parts of the country, including the thickly settled States. Such a plan would help to increase the amount of game in several ways, and would fulfill some requirements that game laws alone never can. Some of the reservations, especially in the northern part of the country, would afford suitable and safe breeding places, of which the birds would soon begin to take advantage. Others would furnish resting and feeding grounds during the migrations—places that they can hardly find in many sections—and this, more than the fear of being shot, leads them to avoid these regions.

I would expect a great deal of good from such a system of reservations, and would be glad to know if any one has any other scheme, short of an absolute close time for a number of years, by which the migratory birds that have abandoned part of their former range would have any chance of being restored (I believe this is one of the phrases in Mr. Lacey's bill) to their former haunts.

In regions where there are few suitable places for water birds, either on account of the natural features of the country or because of the changes that man is responsible for, it would often be possible by building a small dam to partially flood some stretch of ground that is now too dry for the birds, but too wet to be of much use otherwise, and thus make an ideal place for them, and at very small cost. I freely admit, however, that if the reservations were not established in just the right sort of places they would do no good at all.

The suggestion of the editor of FOREST AND STREAM that the State Governments might establish reservations as well as the national Government is a good one. I certainly hope they will do so. But I hope that this

possibility will not lead any one to think the undertaking superfluous, or to shut their eyes to the fact that the probability of the States carrying it out to the extent that it needs to be carried, or with regard to anything but their immediate and local interests, is exceedingly remote. Only a few at most of the States would do anything about it at all, and the reservations would consequently not be so distributed over the country that the birds would get protection at the times and places they most need it. Probably the States where reservations could be placed to the best advantage to the country as a whole would not be the ones to take any interest in the matter. People have not yet got over the old notion that ducks or plover and snipe, or even woodcock, can be permanently protected by the same methods that partridges or rabbits can. Let me emphasize once more the fact that in the case of migratory birds our methods of protection fail if they cannot maintain the total number of individuals that migrate through our territory or visit it at certain seasons of the year. Mere local increase means very little, probably only that for some reason the birds have been drawn away from some other section. Moreover, State reservations would continually be tampered with by the Legislatures, which never let well enough alone. They would be an important addition to a system under control of the national Government, though not a substitute for it.

In conclusion I will mention that I spoke of the interstate commerce law, not because it has anything to do with the Lacey bill, but as a case where the national Government assumed a power it had long allowed the States or individuals to exercise, because they had used it to the disadvantage of the residents of other States.

The question of the limitations of the power of the national Government would not enter into anything the proposed Fish and Game Commission would do. There would be no occasion for their authority clashing with that of the States, and on reservations owned or leased by the Government they could forbid trespassing just as any private individual can on his own lands.

W. G. VAN NAME.

PHILADELPHIA.—*Editor Forest and Stream:* The communication of Mr. Frederic Irland, in *FOREST AND STREAM* of Feb. 18, on the "Lacey Game Bird Bill," impressed me as being a presumption either on the lack of information on the part of your readers, or a lack of information on the part of Mr. Irland.

He cites the London Field or any other English sporting paper for columns of advertising of pheasants' eggs, partridges, etc.

Mr. Irland forgot to mention that English estates are mostly entailed; that the shooting rights of these estates are vested in individuals; that each estate has its crew of keepers, whose duties are to breed the game, protect it from vermin and poachers, train the dogs, etc., and that their fitness for the task is the training of years.

It is true that the restocking of covers in England "is a recognized, common, perfectly-successful industry."

As to England, however, it is a private industry. The Government of that country, wise in its way, does not meddle with matters which do not concern it.

Now, considering the industry as it exists, they can only breed such birds as can be raised in domestication, or semi-domestication. All the efforts which have been made in this country to raise the ruffed grouse and quail in domestication have proved to be total failures. In captivity the birds are barren. If their eggs are hatched by a common barnyard fowl, the chicks are so wild from the start that they cannot be domesticated.

Now, will Mr. Irland be so good as to explain the bearing of his reference to the rearing of pheasants by private enterprise in England, and the rearing of quail, ruffed grouse, woodcock, snipe, etc., in America by the United States Government?

He says also: "If you ride from Washington in any direction into Maryland or Virginia in the spring, you are amazed to see the countless thousands of young domestic poultry. They crowd the mother instinct of the hen very hard in this region, and often give one broad-breasted old clucker thirty-five or forty chickens to hover and rear. I believe it would be easy, in time, to have the country swarm with game birds to nearly the same degree."

Those chickens swarm because they are private property. No property owners would permit game to swarm as do the chickens, for it requires a vast amount of food to supply them. But it would be a great field for the furnishing of jobs to men who itch for public money.

To show that the partridges of England do not run about as do the domestic hens of Maryland, and that there is an infinity of care required to successfully raise even a few, I ask your permission, Mr. Editor, to present a clipping, taken from the London Field of recent date, in respect to the rearing of grouse. Other game requires quite as much care in its raising. It is as follows:

In the first place, it is very necessary to have quiet and reliable hens, to save both trouble and disaster after the chicks are hatched, as they are very fragile, and easily trampled and killed. The grouse eggs should be taken—when you are taking them on your own moor—after they have been incubated some time, and then placed under the hens, which latter ought to have been brooding some time, so that there will be no fear of their giving up before the eggs are hatched. It is needless to say that each nest of eggs must be kept separate, and put under a hen, and that there must be no mixing of eggs of different nests.

While sitting, the hens must be duly and regularly attended to as regards both food and water, and taken off the nests for exercise, seeing that they do not remain off too long. When the eggs are hatched, leave the chicks under the hen undisturbed for at least twenty-four hours, and in the meantime have your coops—which ought to be amply large, with a sliding grid door in front—got ready. These want placing on a flag or board on short heather, seeing that no vermin can get in, as weasels or stoats will make short work of them. A flag too ought to be put in front of the coop to feed on, with a large shallow saucer with a few pebbles in the water; this latter ought to be changed several times a day. In addition to these, a small run ought to be made, with each coop, of three boards, say, 11 in. deep, the run to be 8 ft. or 10 ft. long.

This is to keep the young grouse from rambling too far away from the hen, and being lost, which they would be apt to do. This run has to be kept going until the grouse can fly—say in about fourteen days—when the boards can be moved. The coops and runs must be moved on to fresh ground at least every twenty-four hours, and the flags or boards frequently cleaned, for on this cleanliness in a great measure depends the health of the birds, and the success in rearing them.

The young birds, as soon as they get on to the heather, begin to pick it, but, in addition, the keeper ought to have some coarse ground oatmeal, and give some to them on the flag in front of

the coop several times a day, at fixed times, but more particularly at the last feed at night, say about 5 o'clock, calling them with a gentle whistle; they can then be put into the coop and shut up. They are then always ready for their food, and soon get to know the times to come, and are generally there within a few minutes of the time, if not already waiting. This more particularly applies after they have the free run of the ground, but if you wish them to be tame, and come to the call, you must go on, even after they are fully grown, for if they are left out even one night their natural instinct comes back, and the probabilities are they will never come near again. On the other hand, if properly looked after in feeding regularly, and shut up every night, you can keep them tame an indefinite period. Our keeper has kept them for two years, when they have had nests and brought up young broods. He has had as many as sixty tame ones at once, and at his call would come and perch on his outstretched arms and head, and follow him all over the moor, walking after him as well as they could, and, as he left them, flying and alighting at his feet again, which of course is very interesting.

In reference to the food, the oatmeal, after the chicks are, say, a week to ten days old ought to be mixed with a little water and given in pellets; later on, oats can be given. There is, I need not say, a good deal of trouble attached to hand-rearing grouse, and unless the keeper—or whoever looks after them—is prepared and willing to meet this trouble, and devote a good deal of time to the young birds, it is better not to begin with them, as it would only bring about a lot of disappointment to those most interested, through failing to do what was required to bring about ultimate success, which can be obtained if proper precautions are taken.

Nevertheless I cannot imagine any better office than that of looking after one or two hens at a salary of say \$2,000 or \$3,000 a year. If those hens and chickens which so enliven the perspective in Maryland and Virginia were raised at Government expense, the pension fund would be a mere trifle in comparison with the cost of poultry raising. After all, a comparison of a private industry in England as a Government function in America is very far fetched.

L. A. CHILDRESS.

Pheasant Rearing.

From the report of Fish and Game Protector Hollister D. McGuire, Fish and Game Protector of Oregon.

OREGON has always been a sportsman's paradise, but nothing has contributed so largely to spreading its fame in this particular as the Mongolian pheasant, the king of game birds.

Our State being the first place on the American continent to become stocked with these pheasants, has had the effect of advertising us with the sportsmen all over the United States. No other section of the country has succeeded as yet in establishing them, although great effort and considerable money have been expended by a number of States in an attempt to do so. Hundreds of pheasants have been shipped out of this State to nearly every section of the Union. Some of the game commissioners of other States report birds imported from Oregon as doing well and gradually increasing.

Many, in their communications, express astonishment at the statement published in my last report that 10,000 Mongolian pheasants were sold in the markets of Portland last year during the one month (Oct. 15 to Nov. 15) that market sales of upland birds is permitted under our laws. The immense slaughter of the pheasants for market has aroused a strong sentiment favoring the prohibition entirely of market sales. Of course, this proposition will meet with strong opposition from those who do not own a gun and never go afield to hunt the wary ring-neck, but have, nevertheless, learned to look forward to a month of feasting on this toothsome game bird, and will strenuously object to being deprived of their accustomed annual feast.

The demand for Mongolian pheasants for propagating purposes in other States has steadily increased since the enactment of the law in 1895 permitting them to be shipped out of the State, the demand at present being greater than the supply, as only birds bred and raised in confinement can be lawfully in possession or held for shipment. Since the increased demand for these birds for exporting purposes, complaints have come to this office that parties were engaged with dogs trained for the purpose in running down and capturing young birds. One party was reported as having captured nearly 100 young birds in this manner, which were afterward raised in confinement and shipped out of the State as fully domesticated birds. Since my attention was called to this I have changed the form of affidavit and now require the applicant for permit to swear that the birds for shipment were bred and raised in confinement, and by whom. Every application for permit is closely scrutinized and satisfactory evidence required of the shipper that the birds are entitled to shipment before permit is issued.

The correspondence in connection with the exportation of pheasants has grown enormously, much of it coming from other States. Nearly every shipment requires a letter explaining the law. A blank affidavit is furnished, and when this is properly executed and returned to this office, if found satisfactory, the permit is forwarded to the person desiring to make the shipment.

The breeding of these birds for exportation has become quite an industry, and as the birds readily sell for \$5 per pair, bring into the State no inconsiderable sum of money. Very few have been successful in breeding these birds in confinement, however. It seems that they require special care in feeding and handling during the first two weeks after hatching. Many who attempt pheasant breeding give up in despair, as the chicks all die frequently before they are two weeks old. A great many letters have come to this office inquiring as to the method necessary to be employed to successfully breed and raise these birds in confinement. Realizing that reliable information on this subject would be of much interest to those desiring to engage in pheasant raising, I addressed a letter to Miss Jennie Griffith, of Clymer, Marion county, Oregon, who is recognized as the most extensive and successful breeder of the ring-necked pheasant in the State, as well as an acknowledged authority on the subject, asking her to contribute an article for publication in this report on the subject of breeding and rearing pheasants. Miss Griffith very kindly acceded to my request, and the thorough and extensive description of the method employed by herself in the breeding of pheasants, herewith appended, is a valuable contribution on the subject, and should certainly be a guide to those who desire to breed these beautiful birds, either for profit or pleasure:

Care and Propagation in Confinement of the Denny or Ring-Neck Pheasant.

"The phenomenal increase of the twenty-eight ring-neck pheasants which Hon. O. N. Denny in 1881 intro-

duced into the Willamette Valley has attracted attention throughout the continent. They have proven to be an ideal game bird, and although shooting methods are no longer crude, there is little, if any, fear of their becoming extinct. These pheasants, ever alert, with the advent of the shooting season, develop, to a remarkable degree, the instinct of self-preservation. They never flush toward the gunner, and have learned to suspect him and his dog, but will scarcely rise to avoid a carriage and team. The marksman must be skilled and prepared to do quick and long-range shooting. So wary is this pheasant, the approaching sportsman is noticed before he gets within shooting range; the bird is quick to select a furrow as a screen, which it follows on a run until too closely pressed by dog and gunner, it leaves the furrow, usually at right angle, for a possible covert among fern or stubble. If forced to flush, the saucy cry of alarm or whirr of wings as it swiftly flies from the danger marks the supreme moment of pleasure of the sportsman, who has had his pulses stirred with excitement throughout the chase. The majestic bearing and wealth of plumage of the ring-necked cock cannot be imagined by narrative description, and the delicious flavor of his flesh must be tasted to be appreciated. It is not too much to say that visiting marksmen who possess the true instinct of the sportsman, and have enjoyed a day's shooting in this valley, will never be satisfied until their own preserves and fields are well stocked with these festive game birds. Even now there is a great demand for these pheasants. As the game laws of this State require said pheasants to be fully domesticated—raised in confinement and kept for propagation and exhibition purposes if permit to ship from the State is granted—the successful breeders of these enclosed birds find it a profitable source of income. That the new industry may sooner be established, the following helps are respectfully submitted.

"The two essentials are: Properly constructed aviaries and feeding. The former, although easily managed, is more generally neglected.

Aviaries.

"Elaborately arranged, expensive aviaries are not a necessity and may prove objectionable if they prevent the occasional choosing of a new situation. Any plan of aviary which is spacious, well-lighted, clean, thoroughly ventilated, screened from enemies and erected on sloping or well-drained grounds is acceptable; I prefer aviaries tightly boarded on all sides. Such walls protect the birds from drafts and they, wild by nature, enjoying greater seclusion, are more contented. Wire netting, 2 in. mesh, as a roof admits sufficient light and ventilation. If the walls are but 6 ft. high the flight of a frightened bird will not be serious. Avoid frightening the pheasants by giving them one attendant who will announce his approach, and by providing numerous coverts; shrubs planted in the runs are ornamental and permanent; evergreen boughs also are excellent for this purpose.

"Dryness under foot is important, and any mud after copious rains should be kept down by a liberal supply of clean straw. In providing shelter, I build several sheds along the walls—broad enough to afford at all times dry earth. As the pheasants enjoy a dust bath (and should insect vermin infest them such bath is a necessary requisite) wood ashes are added to the dry earth beneath the sheds. Give them sufficient space in proportion to number. Numerous short perches are better than one or two long ones, as the most pugnacious often commands an entire perch.

"A supply of gritty matter and some lime should be thrown in the runs. Thoroughly cleanse and sweeten the ground of old aviaries by spading, and place the birds in duplicate apartments long enough for freshly sown seeds to form a sod. This rotation is most necessary unless the aviary is very large.

Feeding of Stock Birds.

"The quantity of food is best determined by the appetites of the birds. It is a good plan to remain a half-hour or longer with them, throwing out the food in such moderation as to induce a scramble for the tidbit, as they prefer to search for their food. Conceal some in the grass, vegetable leaves or clean straw, and note their eagerness in picking it up. Cease the supply as soon as they show the slightest indifference to it, as overfeeding is a source of disease, and fat hens never lay so well as those kept in a hard, muscular condition. Great care should be taken that the grounds the pheasants are fed upon are clean. The vessels containing the drinking water must also be clean and should be placed in the shade. Keep the pheasants supplied with fresh water. The active, restless nature of the 'Denny' or ring-neck pheasant is an advantage to the breeder, as exercise promotes health, and such bad habits as egg-eating and feather plucking are rarely established. Occupation is more easily devised and their lives less monotonous than those of many other birds kept in limited space. Owing to their active lives they more readily assimilate stimulating and concentrated foods. At a regular early hour in the morning they should be given some quickly digested soft food. Avoid stickiness. Ground oats, cracked wheat, stale bread, cooked potatoes, boiled eggs, curd, etc., may be used constantly with advantage. Do not mix meals with water or milk, as the soft food thus concocted is too sticky for pheasants. These birds are insatiable in their desire for animal food and some should be given two or three times a week. When insects are scarce, boiled beef or mutton finely chopped and mixed with crackers, wheat or meal is recommended. If supplied at the regular feeding hours, tends to make the birds dissatisfied with the other foods. I therefore suggest the animal food to be given at the noon hour. When berries and fruits in season, green food and fresh water suffice. An hour before dusk feed grain. Wheat and oats may be fed at any season; sunflower seeds, peas, corns and buckwheat are added from time to time; the quantity during cold weather may be slightly increased. Grain in the sheaf is the best preparation. It should be borne in mind that birds are thiriest when frequent changes in food are provided, and every pheasant breeder is repaid for the care and trouble in procuring a variety of wholesome foods. A daily supply of as much green food as the birds will eat is indispensable to thrifty growth. It should be fresh. When garden waste is scarce green sods will be found good substitutes; the birds

will in their persistent search for insects tear these sods to shreds with their beaks.

Mating and Breeding.

"The aviary containing the stock birds should be situated in a quiet spot, separated and apart from those holdings birds for shipment, where they may be undisturbed when orders are being filled. These pheasants are polygamous, and eggs collected from yards containing four or five hens and one cock are strongly fertilized. The sooner they are mated the better. If they have been removed from some other run, should be placed in the breeding yards at least a month before the breeding season begins, as they must have time to accustom themselves to their new surroundings. The early hatched chicks are the easiest reared, and each thrifty hen lays sixty or more eggs, beginning April 1. In selecting the stock birds avoid inbreeding and choose well grown pheasants, alert in style and free from deformity. Keep all of your birds full-winged. A rank growth of grass, affording seclusion, encourages the laying in nests. No other laying accommodations may be provided; this wanting, they drop their eggs promiscuously in the yard. They should be daily collected and placed under domestic hens for incubation. During five years' experience I have possessed but one pheasant hen sufficiently tame to trust with a setting of eggs. This especial pet hatched and raised her brood in confinement.

Management of the Setting Hen.

"Always select a tame, broody hen—I consider one with smooth legs and of light weight best. Unless the hen has chosen a quiet, suitable position, secure from interruption, at dusk place her on the trial nest which has been previously arranged in one corner of a roomy coop. Form the nest by securing a turf about 5 in. thick, which, with the grassy side upward, fit into a shallow box and beat the turf into a saucer-shaped hollow; some soft oat straw is last added. Give the hen trial eggs for a day, as she will build and form this nest to her shape and the risk of breakage is thus reduced. Never neglect to free the hen from body vermin. Provide her with food and water, as the eggs are small and easily chilled. During the time the hen is feeding examine the nest and if any eggs are broken they should be removed; should other eggs have become dirty in consequence, or from any other cause, wash them in warm water and afterward wipe them dry. The pheasant eggs are generally fertile and require about twenty-four days for incubation. I have used eighteen eggs as a setting.

Rearing the Chicks.

"When the pheasant chicks are thoroughly dry carefully remove the hen and brood to another roomy coop placed on short grass, with some dry chaff in the corner most protected from cold winds. During unusually severe weather special methods of shelter should be adopted. So construct your coop as to allow the chicks their freedom from the first, but do not frighten them by remaining near to admire or attend them. They are active and wary, and at one signal of alarm from the hen I have known them to scatter and creep through the grass beyond sight or recall. Many have been the disappointments of keepers over solicitous who have searched in vain for these wee birds. If they had retired, the inquiring call of 'chee' from the hidden chick would have soon been heard. The hen's cluck, which they learn in the nest, is the one note to which they will at this stage respond; then leave them undisturbed for twenty-four hours.

"Every two hours for the first week I placed a little hard-boiled egg, bruised small with a fork and mixed with cracked wheat, about and in front of the coop, and leave the hen to teach them to eat. As they grow they should be fed at gradually increased intervals, and curd, stale break crumbs and other grains may be added. Early in the season the chicks find insects among the grass and in the garden; when the range is exhausted some acceptable animal food should be procured for the birds too young to forage beyond the coops. Insects, as cutworms, grasshoppers or ants' eggs, are more eagerly eaten than cooked meats; either preparation should be mixed with the egg and cracked wheat, which I regard as the staple food for young pheasants.

"They will not thrive properly unless they have plenty of fresh, green food. As the season advances and the ground near the coops has been run over, I snip into small pieces with scissors dandelion and lettuce leaves; chickweed, onions, bulb and top, are also suitable. Give but little, if any, water the first three weeks. After this critical period, fresh water may be supplied two or three times a day. Never allow water to remain in the drinking basin, as sun heated water is often fatal to young pheasants by causing diarrhoea. Cleanliness is the best prevention of disease and cannot be too strongly urged. Use a certain call at each feeding. Group pheasants of a like age together, as some hens are cruel to birds belonging to other broods. When the birds are the size of quail they should be confined and may then be fed as the stock birds are.

"Handle these pheasants by the body, as their legs are easily broken. There is a satisfaction, aside from the money profit, enjoyed by successful breeders of these beautiful game birds."

Tallahassee Game Fields.

A RECENT letter from Judge R. C. Long reports that about Tallahassee the quail season is at its height, the supply of birds is good, and their condition excellent. Some Northern shooters are here. My little son, fifteen years old, at home from University of the South for his winter vacation, on Saturday, over an old (eight years) setter, found twelve beavies, and bagged nineteen birds out of twenty-six shots with a single-barrel .12 gauge Remington. Lesser scaup are here in great numbers, and in prime condition. They feed on a species of wild celery or Valisneria, growing on the bottoms of our deep freshwater lakes. Shooting them from "stands" along the passes and straits is very high order of sport, requiring grit and skill, and is much engaged in by our local shooters. They are just a little faster in flight than any other natural or any artificial target I have ever crooked a finger at.

Adirondack Deer and Hounds.

THE ADIRONDACKS, Feb. 10.—*Editor Forest and Stream:* Although not a subscriber to your valuable paper, I read it frequently, and am an ardent admirer of the high ideals at which it aims, and the true sportsmanlike ring to its articles from the sincere pen; yet I cannot refrain from replying in part to a recent contributor to its columns (Mr. J. H. Woodward) in an article written in the interests of deer protection in the Adirondacks. In the main his sentiments are mine, though I cannot wholly agree with him on the question of hounding. Even though he has spent twelve consecutive seasons within the North Woods—I assume a few weeks each time—yet I think one to be thoroughly and intelligently conversant with the deer question must be an absolute resident, being in constant touch with guides and natives and in consequence thoroughly able to treat the situation in an impartial manner. Owing to ill health, I have been obliged to live steadily in the Adirondacks for ten years past, having resided in that portion near Paul Smith's and the Saranacs, and I am personally acquainted with nearly every guide within a radius of fifteen miles.

There is not the slightest doubt that the anti-hounding law has done and is doing more to protect and thereby cause a decided increase of our Adirondack deer than any measure that could ever be adopted; it is already manifest in the two years it has been in force. I thoroughly appreciate the feelings of Mr. Woodward when he refers to the sagacity and true hunting qualities of the hound, to say nothing of the excitement that is ever present when one is anxiously waiting on a watch ground, straining every nerve to catch even a faint sound of the approaching dog, giving tongue on a fresh track. All of this sounds very "sporty," but even our noble hound must be "called down" occasionally, and not have it all his own way. St. Lawrence county is an admirable illustration of what a non-hounding law will accomplish if permitted to remain in force a while. The above section is infested with deer, and if a sportsman comes to this vicinity in quest of this game and engages a guide for this purpose, he is invariably taken to or near the limits of St. Lawrence county. And yet, in the face of this indisputable evidence, if this same guide is approached concerning his opinion on the deer law, in nine cases out of ten he will support hounding, when at the same time they all know that, if permitted, it will in the near future annihilate our deer.

Deputy game protectors are lax; in a great number of instances they will break the law as quick as a would-be sportsman, or in other cases, if one finds that the culprit whom he is after proves to be a neighbor or friend whose ill-will he does not wish to incur, of course the case is not pressed, and so it goes. I fear space would not admit, but there are other points I would like to touch upon and lay before your readers in an impartial light. However, in conclusion I would say that after all still-hunting is the only mode that appeals to the true sportsman, in this that the deer has an equal chance; but it is the height of absurdity to contend that in hounding the deer has the same chance as the dog. If you want to hear the melodious voice of your hound put him on a fox track or turn him loose in a rabbit swamp; but spare the deer and enable our North Woods to enjoy the reputation accorded it for years in offering superior inducements to the sportsman.

J. THOMSON GALE.

Shooting from the Hip.

Editor Forest and Stream:

Among the very pleasant features of your paper is the opportunity of exchanging views, queries and yarns. It may be (fish or otherwise), with our brother disciples of the ash or steel from all over this vast sporting world. I was very much amused by the very emphatic demonstration of our old friend and versatile writer Didymus on the hip position in game shooting. He says he has shot with nearly as many men as our great character delineator Fred Mather has fished with, and "never met with more than one instance of a bird being killed in that way," and intimates that that was an accident. Well, he has not seen everything in the shooting field by a long shot. There are several hip shooters, that shoot that way and no other, and they are good shots too.

Some forty years ago, when I was much younger than now, and was considered a fair wing shot, there appeared in our village, away up in the Chenango Valley (Madison county, N. Y., to be more explicit), a little wiry Englishman—Stringen, I think, was his name. He had been gamekeeper or assistant to one for some English lord over the water. Whew! the oldest inhabitant had never seen or heard the like of this extraordinary being. He cleaned up the grouse (partridges we called 'em) for miles and miles around; and he always shot from the hip; said he never shot any other way. He was an indefatigable walker, as well as more than excellent marksman.

One day, upon descending the hills to the flats after a day's tramp (he had five grouse, I one), I thought if I could get him among the snipe or meadow larks in open ground I could do him, or at least hold my own. We found no snipe, but struck a lot of larks. But, whew! I wasn't in it. It didn't seem to make much difference to him, far or near; he dropped them the same. "Long practice," he said, "in the turnip fields" had made him accurate on distances and elevation. And as Forrester says, "With the eye of faith and the finger of instinct" he let go and the birds almost invariably came to bag.

Killing from the hip an accident! Poh! Many a July woodcock, when I was a boy, have I shot in the thick brush without raising my gun from my side; and no later than a few years ago, up in the Pocono Mountains, as I was crawling through a laurel thicket, a cock grouse whirled up in front. I couldn't get my gun up on account of the tangled brush, but I gauged as well as I could as the bird towered, and he came down. I don't call that an accidental shot any more than if I had glanced along the barrel and been as successful.

I have no doubt there are many sportsmen, notwithstanding Didymus' very positive assertion calling it stuff,

who have made many successful attempts from the hip that were not chance. I have in my mind now a resident of Jersey City, one Richard Dyne, whom I regard as one of the best brush shots (on grouse more especially), barring neither John Henry Outwater nor Sam Castle, in the State; and that is saying a good deal. I know of his killing at least two grouse without raising his gun to his armpit; and I have little doubt that Sam Castle or Hen Outwater will own up to the same. But why run on so garrulously on so palpable a thing. Let Didymus start something about which he is better posted before he calls it stuff.

JACOBSTAFF.

Boston Sportsmen.

BOSTON, Feb. 18.—Quail shooting in the South is getting up a good name among Boston gunners who can find time and means to enjoy the sport. Harry B. Moore, of Boston, and Geo. C. Moore, of North Chelmsford, have hunted and fished together about as much as it is possible for two busy men to do. This year they again planned their fall outing for the South, and have just returned. They left Boston Jan. 19 for Hickory Inn, on the Southern Railway, between Salisbury and Asheville, N. C. Here they were met by Dr. French, one of Boston's best known gunners. They had seven or eight dogs, mostly pointers, of registered breeding, and most thoroughly trained. The Northerners were in charge of a guide thoroughly posted in that part of the country, and went quail shooting about every day. Still they did not shoot for numbers, for Dr. French was quick to call a halt when from eight to a dozen birds had been taken. They hunted mostly over ridges of cleared land, and Harry Moore says that it was worth the trip to see the dogs work. They could stand on one ridge and watch them work another. The weather was fine, with mercury registering about 60 in the middle of the day—not too warm. The dogs were very fast rangers, generally working in couples or trios, and the Boston gunners were particularly delighted with their careful pointing and steadiness, one dog never disturbing the point of another, but immediately coming into position too. In every case the hunters went forward and flushed the game, which they could not see, and often the birds would get up behind the gunner, requiring skill and practice to whirl and shoot in season.

After a few days of this delightful North Carolina weather and shooting there came a snowstorm, and this was the signal for packing the guns and starting for Florida. They visited St. Augustine, thence to Tallahassee, and thence over to Panacea Springs, near the Gulf Coast. Here they stopped to enjoy the shore bird shooting, which they found to be all that could be desired, especially snipe shooting, which birds they found in great variety. The weather was warm and this had started the ducks and geese north to some extent, though they had some shooting on that class of game. The inhabitants always tell strangers that there are no snakes in their particular section, especially in winter, but they do crawl out in the sun occasionally. The hunters were a good deal startled one day by the sudden jumping backward of the negro guide, as they were beating through the canebrake and saw palmetto. He pointed ahead, and there lay a big moccasin. It took only a charge of shot to settle him, but the boys were more on the alert afterward. Speaking of fireflies, there are doubtless some big ones on the Gulf Coast of Florida. One night there was a tremendous flashing in the canebrake and Harry Moore called the landlady of the house to see it. She allowed that there were many good-sized flies of that class there in the summer, but she had never seen one that made so much of a flash as that. She called to the principal darky man, Joe, to come and see it, and if possible to capture it for the Northern hunters to take home. Joe allowed that he had never seen anything like it, and shouted for the other negroes to come and help him catch it. They skipped about in the darkness as well as they could and tried to put their hats over where it was last seen. Each time it eluded them, and would flash in another place. All this time Harry Moore was calling to George Moore to come down stairs and see the firefly. At last it flashed directly in the face of the foremost negro and nearly blinded him. With a yell of fear he ran from the canebrake, followed by the others; the light flashing after them. By this time Harry Moore was nearly dead with laughter, and George, who was really in the canebrake with one of the new electric flash tubes in hand, was ready to join him. Those two hunters are always sure of some joke every time they go on a trip together. Since they got home Dr. French has sent each a beautiful specimen of Florida squirrel, to be mounted.

SPECIAL.

Mountain Parks.

MISTAKEN effort is pending in this State and at the national capital to open the mountain reserve parks to sheep pasturing. With the increase of Western population, the available ground for promiscuous feeding has been constantly shrinking, and the wool growers feel that it is but right to allow them the unoccupied meadow lands in the Government reserves.

Two weeks ago the Post-Intelligencer printed a very timely communication, setting forth the injury which sheep pasturing has wrought to the meadow lands of other States, and urging that the State of Washington be far-sighted enough to take care of its natural beauties while they are yet undamaged. There was much sentiment in the communication, but it was eminently wise on the whole and must have met with general approval.

The mountains are places for sentiment, and sentiment holds an indispensable place in the happiness of humanity. But there is something more than sentiment which inhibits the spoliation of places of wild nature. There is something in the congested life of modern municipal civilization that requires that districts unmarked with the aspects of artificial development be available. Lest man should become worn and coarse with the constant contemplation of his own works, it is necessary that he shall be able, when he so desires, to withdraw to a retreat where he can feel that the world and all that is in it takes care of itself independently of his effort, where, in

other words, he may rest with the pleasant consciousness of irresponsibility.

In the environment of nature's beauties man feels that there is some one beside himself to build his roof for him; some one, if it be only the grasses, to lay his walks and paths; and where the destructive human instinct has not revealed too long there is wild game upon which he may feed. There are purer waters in the streams, free for the mere dipping of them, than the best of mechanical means will enable him to pipe to his cities. There is oxygen and ozone to build up his system, instead of the drug. And there is indifference to dress, and variety and spontaneity of exercise.

But fill the parks with sheep, or hew the timbers away for profit, and the problems of our city life or the problems of our country homes will but be transferred to the scenes whither we go for rest. For sanitation's sake we shall find it necessary to sweep away the tracks of the sheep, to box up and pipe the springs; instead of taking water from the streams. For shade's sake and for art's sake we shall find it necessary to supplant the hewn timber with the trees and the shrubbery of artificial choice, and to apply the human mind to the fashioning of landscape and gardening where it had been so much better done by nature.

Against this the impulse to sequestration and rest makes a most natural outcry. We feel as if we wanted our parks as nature made them, unmarred by hoofs and untorn by the saw or the axe. We feel as if we wanted them in all their rough weirdness, shaped in that incomprehensible disorder in which earth maintains its beauty and baffles human imitation.

Something more than "Lower Gardens of Eden," as they have been called, are those mountain parks. They are places of beauty and of pleasure which never pass away. They are gardens where man may perpetually retreat and learn to value at its least the tree of knowledge at which he has so long feasted, and to value at its greatest the infinite fruits which yet remain untouched.

If we pasture our flocks upon them, what shall we gain? A few years' food, a few years of money from clean wool, and then—a barren field. Shall we sacrifice so much?—Seattle (Oregon) Post-Intelligencer.

CHICAGO AND THE WEST.

All about Hunting Knives.

CHICAGO, Ill., Feb. 11.—I am in receipt of considerable correspondence this week, which makes my desk look a good deal like the workshop of a trade paper. Much of this matter is of necessity of a trade nature, yet I consider it to be so interesting that readers of FOREST AND STREAM will be glad to see it. The hint to all manufacturers, whether of footwear, hunting knives, or anything else which sportsmen use, is so obvious that I should think they would need nothing further than to express their thanks and send their orders.

For instance, here is the matter of a hunting knife. Everybody has seen these long-bladed, sharp-pointed hunting knives which fill the cases in the sporting goods stores. This is something like the old Bowie knife model. I do not know who first conceived the thought that it would make a good sort of hunting knife. My experience is that you cannot skin anything with these knives, and that they break when you try to open a tin can with them. The chief fault with most hunting knives is that the blade is too long. The closer the point is to the handle of the knife, the better you can skin with it. All trappers know this. Their skinning knives are short-bladed. With a short blade and a curved point you can skin, and also cut about all you want to with a hunting knife. I bought a knife a while ago with a 5 in. blade and a round rubber handle, which is about the best thing in knives I have got hold of yet. It has no guard and the handle wedges tight in the sheath. It is so short that I can wear it horseback safely, and can sit down when I am at dinner with a friend without mussing my dress coat. It is not heavy, but is strong.

The following letter I have received from a firm at East Wilton, Me., and I take this means of answering it in the hope that other readers also will come forward with their ideas as to what a good hunting knife should be. There is a great variety of taste on these matters, and I think the firm will get some valuable information from suggestions which readers of FOREST AND STREAM are very apt to make. The communication is as below:

"In your article in FOREST AND STREAM, Jan. 21, pages 52-3, we note your reference to a knife presented you at Christmas time. We have, for a long time, had the manufacture of a strictly first class, up-to-date hunting knife in view, but we have been holding back because we could not seem to find a pattern which would give general satisfaction. We manufacture machetes, and our No. 15, 18 in. blade, is a dandy for all kinds of rugged work, but we hardly think it is an all-round article such as is demanded by sportsmen, and we are writing to ask if it will be encroaching too much upon your valuable time if we ask you to kindly give us a sketch, rough, on paper, of your ideal hunting knife, what its length, form and weight should be, and what style and quality of handle."

At a later time I may perhaps be able to evolve a knife, with the assistance of my friends. At present I should say the most useful knife for all-round purposes in hunting is a sheath knife, with a handle which offers a good grip, with a strong, straight blade, with a curved point which will serve for skinning. I should not think the blade ought to be over 5 or 6 in. in length, and the handle not over 4½ in. There should certainly be no guard on the handle. In the canebrakes of the South even to-day a bear is sometimes killed with a hunting knife, but this rarely happens and need not be figured on. It should be borne in mind that the hunting knife is not a fighting knife, but mostly an eating and whittling knife, and once in a while a skinning knife. It is not nowadays used very much in cutting up such large game as buffalo. You can skin and cut up an elk with a 5 in. blade if you know how, and you can cut up a deer with a pocket knife. Some of the best hunters use nothing larger than a pocket knife. It should be remembered that the perfect skinning knife is one with a curved blade, and the straight-blade hunting knife is a compromise.

When I go out for bear I usually have two little knives, a short skinning knife and a short hunting knife, and also a steel. This is only when I have on my war paint. When I want to travel a long way, and go light, I carry my little hunting knife and my little axe, which weighs a pound and will cut anything. Then I do not care where I am when night comes, and I can very well take care of anything I kill during the daytime.

The heavy Hudson Bay knife of which I have been writing lately is a cross between the axe and the little hunting knife. It is good for cutting wood, or cutting bones, or tin cans. You could skin a large animal with it if you had to, and you could whack off its ribs or its backbone. The main trouble about this knife is its great weight. Yet it weighs little more than my knife and axe together. Here is what Mr. D. H. Macgowan, of St. Paul, Minn., writes about the old Hudson Bay knife:

"I will tender no apology for addressing you on the Hudson Bay knife question. When I read your description of the pretty toy, and the manifold duties to which it might be applied, I hankered for one. Not that it was likely to be of any service to me, but my wife could utilize it for cutting button-holes, and the baby could play with it. The Land Commissioner of the H. B. C. ('Here before Christ,' the old-timers say the initials stand for) is an old friend of mine, and I wrote him in reference to the knife, describing it as a pup out of a Texan Bowie knife by a Cuban machete, and asking if they could still be obtained. He replied promptly, enclosing a sketch of the knife, which sketch I forward you herewith, that you may compare it with your weapon, and ascertain if they are similar. The price of the 'tickler' is only \$1, a great drop from the day when it brought twenty beaver skins. I enclosed my dollar, with shipping directions, and received the toothpick yesterday."

"Seeing in to-day's FOREST AND STREAM that a Mr. Scudder is after you for information about your cutlery, and that you have switched him off upon poor Mr. McChesney, who had trouble enough of his own without your bringing down on his devoted head an avalanche of letters from the FOREST AND STREAM family, from Dawson City to the Gulf of Mexico, I will, to lighten Mr. McC's burden, request you to inform all sportsmen with a taste for accumulating bric-a-brac of that description can now do so."

Mr. Macgowan's sketch shows this old knife to be identical with mine, 14 in. in length, with blade 9 in. in length. The blade is 2 in. wide, and ¼ in. thick on the back. The handle is 5 in. long, and has a heavy band of brass 1 in. in width, reinforcing the handle next to the blade. The knife has no guard. The handle is flat, but with a widening on the end which gives the hand a good grip, the under surface of the handle being slightly curved. The great beauty of this knife is its excellence of steel and its great strength and durability. I should say that it was better adapted to the past than to the present conditions of the country, though a most excellent implement for certain conditions of sport.

I offer the above, as I have remarked, chiefly in the hope that this may call out expressions of opinion from others of the FOREST AND STREAM family. There would probably be a market for a good hunting knife of the practical, useful-in-camp sort. We do not skin buffalo nowadays, we do not fight bears, and we do not carve our brothers-in-law, as we used to do not so very long ago. Of course, every one has heard of the Arkansas man, and I don't know but I have earlier referred to him, who remarked that his own brother-in-law was the "sweetest-cutting man he ever saw in his life. He cuts just like a pumpkin." It seems to me that the builder of a hunting knife should have reference not so much to the brother-in-law factor as to the opening of a can of sardines, the whittling of a box-lid, or the taking off of the skin of some animal less than 3 or 4 ft. long. I have found that my hunting knife makes an excellent paper knife also, and I suspect it of being used now and then in the paring of the domestic potato. Alas! such is life, and thus are changed the ways of the Wild West, into which erstwhile strode men with high boots and long, long knives.

All about Rubber Shoes.

I shall really, as a matter of self-defense, be obliged to ask some boot and shoe man to advertise my leather-topped rubber shoes. I see no reason why I should favor tradesmen who do not avail themselves of the privileges of FOREST AND STREAM's advertising columns, but I just take this method of thanking them all for their responses to my request for information on rubber shoes for my friend McChesney. A gentleman at St. Anthony Park, Minn., says: "Noting your inquiry in FOREST AND STREAM for rubbers, I can furnish them in 12 in. leather tops for \$3.25; 8 in. leather tops, \$2.75; 12 in. canvas tops, \$2." This is straight trade, and in justice to other customers of FOREST AND STREAM I must decline to give trade address.

Mr. H. J. Morgan, of Cambridge, Vt., says under date of Feb. 6: "The rubbers with leather tops which you desire have been sold this winter in one of the villages of our town, and if you will write to the address I give you can no doubt get the address of the house where they can be bought, should you not wish this firm to send them direct." I thank Mr. Morgan very much and enclose his letter, with others, to Mr. McChesney.

Mr. Macgowan, who was so good about the Hudson Bay knife, comes to me with the following information which he has dug up regarding my leather-topped rubbers. I have taken the liberty of sending also to Mr. McChesney the card enclosed with Mr. Macgowan's letter, which follows:

"I think I have found the rubbers you have been looking for so long. They are 'Gold Seal' lumberman's rubbers, leather tops, moccasin heels, and both soles and heels have heavy roll to protect from crust cutting. They carry two styles. One has 6 in. leather top with six lacing places, the other has 10 in. leather top with eleven laces. Retail prices, \$2.50 and \$3.50. I enclose firm's card, so that if you wish you can order direct; but if I can be of any use in making a selection for you don't hesitate to call on me. Will be pleased if I can be of any service to you."

(Respectfully referred to Mr. McChesney.)

Just to show there is no coldness, I would like also to

run the following letter from Mr. C. C. Jones, of Sandwich, Ill. Mr. Jones has discovered something of the same sort of thing that Mr. McChesney and myself have run across before now. He says:

"I notice that you are looking for a place to buy the special lumbermen's rubbers with grain leather tops, and am glad to inform you that in your town they are sold. I have cruised in all kinds of footwear, have run the gamut from buckskin moccasins to cavalry boots, but these rubbers, worn with good thick German socks, are the first and only shoes that I ever struck that I could call just right for still hunting in cool or cold weather. To almost every hunter of big game the problem of footwear is more difficult to solve than the rifle question, but these rubbers will cure insomnia for those who have been studying over what to wear for still-hunting work."

I shall have to stop on this rubber business before long, but must add the note from City Treasurer B. S. Phillips, of Eau Claire, Wis., who says under date of Feb. 8: "If you are still in the market for gold seal rubbers with leather tops, will say that if you will correspond with the local firm named you can get anything you desire in that line. I beg pardon for putting in my oar."

Referred to Mr. McChesney.

I am very much obliged to Mr. Phillips and to all the others above quoted. These things I submit as proofs of the extent and of the intelligence of the FOREST AND STREAM family. I started out quite a while ago to get my friend this pair of shoes, and I think I have now gotten so far as to be able to assure him that he need not go unshod.

Death of Colonel Sexton.

Col. James A. Sexton, Commander-in-Chief of the G. A. R., and a member of the War Investigating Commission, whose death occurred at Washington last week, was formerly concerned to considerable extent in the sportsmanship of this section. He was a prominent member of the old Cumberland Club, and stood high in the Councils of the Illinois State Sportsmen's Association in the earlier days. His death is mourned by very many warm friends in this city.

Minnesota.

Mr. H. P. Jewell, of Wabasha, Minn., writes me that Warden Fullerton is having lots of trouble with the ice fishermen. He was tried at Wabasha under a suit brought by fishermen on the charge of malicious destruction of property. The suit came up last Friday and was postponed for two weeks after a hot session of several hours. Meantime all of Lake Pepin has blossomed out with spearing shanties, and the end is not yet in sight. Mr. Jewell offers some rather hard news about the quail crop, and I regret to say that it is likely this news may be duplicated from many sections of the West which have been visited by the late protracted spell of bitterly cold weather. It has been colder here in Chicago this week than at any time since 1872. It has frequently been mentioned in these columns that the quail are moving northward in the States of Wisconsin, Michigan and Minnesota. I have little doubt that they will eventually reach Lake Superior. Yet this change of habitat can never be permanent, for it must always be subject to severe winter weather, such as that we have lately been experiencing. About his birds Mr. Jewell remarks:

"There were more quails about here last fall than for twenty years back, but I am afraid the cold weather will be too much for them, for it has been unusually severe. My thermometer registered an average of 25 below zero at 8 A. M. for five consecutive days, and has not been above zero but a few hours for ten days. At the present writing it is 15 below. An acquaintance of mine picked up four dead quails out of the snow a short time ago, apparently frozen to death. This is a mighty bad omen."

Flight Coming North.

Already the ducks and geese are coming up from the South, close on the heels of the worst cold this country has known for twenty years. At Lake Senachwine and other Illinois River points there was a good flight on yesterday, including many geese and swans. Some of the Chicago boys have left to-day to see what they can do.

In Minnesota.

The ways of the market hunter are peculiar. I have already mentioned some of the ways in which the Illinois shippers evade the law, such as marking quails as "butter," sewing birds up inside rabbits, etc. It would seem that the Illinois market man is not alone in his weird imaginative powers, for out in Minnesota they also have ways that are vain. Mr. Fullerton, warden of that big and busy State, says in a recent personal letter:

"We have seized game in all manner of ways, in cars of wood and cars of hay; in butter tubs and egg cases, and as household furniture, and to-day we seized eight dozen partridges in a whisky barrel labeled whisky, and that, I think, was a new idea in the matter of shipments of game. They are giving me a lot of trouble down in Wabasha county in regard to the burning of some fish houses and nets. I burned forty pound nets and twenty fish houses, and they have sued me for arson, for malicious destruction of property and civilly for the value of the nets and houses. We would have been satisfied in just burning the stuff up if they had let us alone, but now we are going to prosecute each one of them so we will meet them halfway in the fight. Of course, I expect to defeat them in their suits against me, but it is rather disagreeable to have those suits pending."

"I think our new bill that we have called the 'conference bill,' because it was agreed upon in Chicago, is going to pass our Legislature, and it will be a good thing."

E. HOUGH.

1200 BOYCE BUILDING, Chicago, Ill.

Fox Squirrels.

A CORRESPONDENT wishes to know where fox squirrels may be found in numbers sufficient to make it worth while to hunt for them.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

Zigzag Experiences.

IV.—A Luscious Meadow Lark.

Tempo—The sea fowl shooting season of a few years ago.

Dramatis Personæ—Two Massachusetts sportsmen of which the writer was one.

Scene—The shooting box of Captain Andrews situated on the coast of Virginia, south of Cape Henry, amid the vast regions of sand and water adjacent to the Atlantic Coast, where human habitations are few and far between, and where myriads of sea fowl make their winter home.

THE stress of weather prevailing during the early morning hours sent many visitors to our decoys at Shell Point and many a prized canvasback and goodly redhead were added to their score before the furious gale subsided, and the morning flight was over.

Soon thereafter my companion proposed that we return to headquarters and exchange our heavy guns for lighter arms and seek the scaup, scaup snipe in many of the swales and marshy patches with which this coast abounds.

Accompanied by our boatmen and gunners, we divided into two parties, and journeyed northward toward one of the life saving stations some four miles away.

This proved to be one of the days when I was at my best, and I killed about everything I shot at, and made several long distance and difficult kills that won the admiration and praise of my boatman—especially a meadow lark that fell to my gun soon after the starting out.

Meeting by appointment at the life saving station, my companion's game bag proved to be empty, although his ammunition pockets had been materially lightened during the journey.

Candor compels me to admit that this was a very unusual experience for him, who offered as an explanation the impaired vision resulting from the seething, cutting sand with which the air is filled, and which produces sand ophthalmia, a very prevalent disease in these parts.

But sand or no sand, he was made the butt of much jesting and good-natured chafing, for wasting so much good ammunition and failing to score. This was persisted in until he became somewhat touchy and said I had better opportunity to kill than he had, and that he could beat me at the game if I would exchange routes with him on our return trip. This was finally agreed to, each to follow the tracks left in the sand by the other, when I assured him that if a life saving boat was to take wings he couldn't hit it!

I had not proceeded far on the return before the drifting sand had so filled his tracks that the trail was as hard to find as the place on his now bald head, where he used to part his hair. We finally struck a bee line for Little Island, the home of Captain Andrews, showing but indistinctly in the hazy distance.

I added several more of the cork-screwing birds we sought to my score, and arrived at our destination a little in advance of my opponent.

The Captain being a jolly man, enjoyed the story of my companion's discomfiture, and said he must touch him up a little. On his arrival the Captain complimented him upon the large bag of birds which I told him he had killed.

Not having killed a single bird on his return, this proved the last straw, and he broke in just when I had taken the meadow lark, which I had shot several hours before, from my pocket. "There," said he, grasping the bird, "the Doctor may tell big stories and think he is a great shooter, but I will bet a bottle of Extra Dry that he can't hit this dead bird when I throw it up into the air."

Now a bottle of Extra Dry just about this time would be most acceptable, and the boquet would be much more choice if the sparkling nectar was drank at my companion's expense, so I said, "It is a bet! Let her go!"

He tossed the bird up, when it immediately took wing and struck a lightning gait, going toward North Carolina. I threw my gun to my shoulder, sighted as well I thought as I ever sighted a bird in my life, and bang! — bang!! — but so far as I know that bird is going yet!

Then on whom was the laugh? And who paid for the wine? GEO. McALEER.

WORCESTER, MASS.

The Ways of Quail.

THEY were sitting together, as usual, in a popular resort in Paterson, discussing the pleasures to be had from the use of rod and gun, when one of them remarked: "I received a letter last week from a doctor in Tennessee who has done little for the past ten or fifteen years than study the habits of quail and other birds. He gave me some information which fully agrees with my own observations, and which may account in a measure for the scarcity of quail in some seasons, when, according to all rules, there ought to be plenty of them."

"Suppose you tell us something about the domestic arrangements of the quail," said the young neophyte, who had only recently purchased his first gun.

"Of course we all know," began the veteran student of natural history, "that in the latter part of April or the first of May, according to the forwardness or backwardness of the season, the quail mate, there being only one cock to each hen. But that seems to be about as far as the naturalists have pursued this subject. But there is frequently trouble before the process of mating is accomplished. Cock quails are like men, they take a fancy to a particular hen and they think they cannot live without her. When two cocks evince a liking for the same hen there is trouble, and it is only when one of the cocks is severely thrashed that the other withdraws. When there are just as many cocks as there are hens there is less trouble, for finally each finds a mate and sets up housekeeping. When there are more hens than cocks there is no trouble, for the unmated hens go off by themselves and do not interfere with the rest. But when there are more cocks than hens there is serious difficulty. A bachelor cock, who has been disappointed in his love affairs, goes about from household to household, assaulting the hens, frequently injuring them in his violent passion, and breaking up the household by destroying the

eggs. Too many cocks are a nuisance and serve to destroy the young birds. If a cock, who has an embryo family, is killed, his nearest male neighbor will take care of the widow and subsequently of the little ones, but it is very seldom that a widow will put up with a bachelor. She seems to prefer somebody who is somewhat acquainted with housekeeping and the duties of a husband. It is on this account that in some places men who have preserves have a number of the cocks shot off just after the mating season has begun; they know that a surplus of cocks is injurious, and that a few less than the equal proportion is just as good as the full number."—Paterson (N. J.) Chronicle.

The Woodcock Flight.

NORTH FERRISBURGH, Vt., Feb. 16.—*Editor Forest and Stream*: In the FOREST AND STREAM of Feb. 4 I see Old Reader, of Hamilton, Ont., speaks of the scarcity of woodcock in the Niagara peninsula the past fall.

The last ten days of September I was in the Adirondacks and traveled over what has formerly been the best of woodcock cover. The cover is still the same as for the past twenty-five years, little or no land clearing having been done in this section. A few cock were bagged each day, but I have since been informed that the flight birds which before this have stopped on these grounds in large numbers in October failed to put in an appearance this fall, and no shooting was to be had after about Sept. 28.

It hardly seems possible that this can be the result of overshooting entirely, but I am of the opinion that in migrating the line of flight has changed.

I am much in favor of the Lacey bill now before Congress, and hope to see it become a law. But I think the result would be far more satisfactory for each State to place far more rigid protection on its game, and get the increase from the supply on hand than try restocking after this supply is exhausted.

The pheasants in this State are just now where a rapid increase in numbers might have been looked for, but the short-sighted representatives of this State who met at our last Legislature gave an open season on pheasants of fifty days, beginning Oct. 1. The farmer should now post his land against all shooting, and unless this is done the pheasant will soon be a thing of the past.

We also find with the rapid decrease of ruffed grouse the open season was lengthened fifteen days when it really should have been shortened a month or more, at least this is the opinion of FERRIS.

The Menotomy Club.

BOSTON, Mass., Feb. 13.—The third annual banquet of the Menotomy Fish and Game Club took place in Menotomy Hall, Arlington, Mass., Friday night, Feb. 3.

The hall was decorated to represent a Maine forest of firs. At one end was a hunter's camp with its pine lean-to containing the usual camp paraphernalia. In front was the regulation camp-fire blazing brightly, and suspended over the fire on the white birch cross-piece was the boiling kettle. The frying pan was not far away. Perched in a spruce near the camp was a large great horned owl, which in the Maine wilderness had swooped down on J. W. Roneo, carrying his hat away and scaring him nearly to death.

At the extreme end of this miniature forest was a standing deer, which was nearly spoiled for the taxidermist by having been "set up" after being killed in such a manner that A. Bart Hill emptied a full magazine Winchester twice at it with different holding each time.

On the walls were hung many trophies killed on the club's preserve, which is in northwestern Maine and the Province of Quebec.

The table was set in a clearing. President N. J. Hardy called for order at 8:15 with a camp hatchet. After a visit to the spring near the door the members and guests sat down to the tables. After the banquet cigars were lit and story telling commenced. Nearly all the members had a word to say.

A. A. Tilden spoke of the formation of the club. Walter B. Farmer of a successful moose hunting trip, as did Everett L. Pope and others. Alfred S. Swan of trout culture. A pantomime on President Hardy by Dr. Stedman was cleverly done. Music by the orchestra, singing by the glee club, and other entertainments wound up the evening. ZERO'S SPORTSMAN.

The Hudson Bay Knife.

HAMILTON, Ont.—The accompanying outline is drawn from the Hudson Bay knife, as supplied to the trade by Canadian jobbing houses. We believe that any of the Sheffield cutlers could supply them, but as they do not

carry stock made up, considerable delay must be expected. Any reader of the FOREST AND STREAM should be able to secure one of these through his local dealer by having his tradesman order from the New York agency of Messrs. Alfred Field & Co. the "Hudson Bay Knife No. 01432." W. V.

Duck Hunters in the Great Storm.

GREENPORT, L. I., Feb. 15.—Herman Kuehne, Edwin Tuthill, and Daniel Brown, of East Marion, who were carried out to sea on Monday in two small boats, which had got caught in the drift ice, reached their homes today, after a most trying experience. After getting caught in the ice the men, who had been duck hunting, drew their boats up on the largest floe and arranged them so as to form a sort of shelter. On Tuesday the floe drifted in toward shore at Montauk, and launching their boats, the three duck hunters rowed for Gardiner's Island. They managed to reach the island, but not until early this morning. They were cared for by the United States engineers engaged in constructing fortifications on the island. The crew of the tug Alert, sent in search of the gunners, brought them home.—New York Times, Feb. 16.

Quail Weights.

STEVENSVILLE, Pa., Feb. 11.—In answer to Didymus' inquiry as to weights of quail, I have shot and weighed quail in Pennsylvania, New York, Michigan and Canada, and the heaviest birds I ever bagged were reduced to possession right here in the northeastern corner of Pennsylvania. The heaviest birds I ever scaled in Michigan or Canada were 7 to 7½ oz., while the last three birds I bagged here the past season weighed respectively 7¼, 8 and 8½ oz. I noted also that the heaviest birds, instead of having the clear white distinct head pencilings of the supposed cock quail, had the mere modest, brownish-white markings of the supposed hen. NOM DE PLUME.

The Ohio Rabbit Law Destroys Quail.

FINDLAY, O., Feb. 9.—The weather here is at present very cold, 18 degrees below zero, with about ¾ in. of snow, so the quail should not suffer, as they can gain access to food without much trouble. The supply left over is sufficient, and with a good breeding season we should have good shooting here next fall. But what we need most is protection on rabbits. This would save many quail from the destructive pot-hunter, since the present law offers an excuse for being seen out with a gun. J. C. B.

The .303-Caliber as a Whale Gun.

MR. E. T. EZEKIEL, resident manager of the North American Commercial Co. at Wood Island, Alaska, reports to the San Francisco agents of the Savage Arms Co. the interesting fact that he killed a whale with the Savage .303 mushroom bullet. This is applying modern equipments in a way quite unexpected. If the repeating rifle had been invented a half-century earlier and adapted to whale hunting, the American whale fishery would have been exhausted long before it was.

Sea and River Fishing.

Proprietors of fishing and hunting resorts will find it profitable to advertise them in FOREST AND STREAM.

CHICAGO AND THE WEST.

Chicago Fly-Casting Club Annual Banquet.

CHICAGO, Ill., Feb. 18.—The Chicago Fly-Casting Club held its eighth annual banquet and business meeting at the Chicago Athletic Association Monday evening, Feb. 13, thirty-six members and several guests being present. The tables were handsomely spread and the menu was ample and artistic. The entire occasion was one of dignity and interest, and it is rarely one sees at any banquet an assemblage so high in average of personal appearance. The fly fisherman is above all things a man and a gentleman. I think I never saw a better looking lot of men together. The post-prandial programme was replete with good things, the several speakers being especially felicitous in their nominating speeches.

President Fred N. Peet was in the chair, and Secretary George A. Morrill took care of the records. The business meeting began at about 9:30, the routine reports of the secretary and treasurer occupying but a brief time. A nice balance is shown in the treasury. The report of the executive committee was approved. Under new memberships the names of Mayor Carter H. Harrison and Mr. John I. Caldwell were brought up and added to the list of the club by unanimous vote. Mayor Harrison has a wide fame as a fly fisherman, and he is not only an ardent, but an expert fly fisher. He was one of the most frequent visitors to the Michigan streams in the grayling days, has whipped the best of the Canadian waters to the Eastern seaboard, and has shown himself by no means unwilling or unable to land bass on the fly rod along the historic Kankakee. His name is no ordinary one, and the club is to be congratulated on its accession.

In the election of officers, Mr. Itha A. Bellows was chosen to the position of the presidency, Mr. E. R. Lettermann being elected vice-president and Mr. George A. Murrell being continued for the third year in the position of secretary and treasurer. Mr. Murrell's conscientious performance of his duties may perhaps be made lighter by the fact that he was voted \$100 salary for his duties last year, and also \$100 for the ensuing year. A rattling good captain was chosen in Mr. Harry G. Hascall. Mr. Fred N. Peet was chosen for the three years' term on the executive committee, in this case the club following the usual precedent of placing the retiring president on the board. Mr. Peet voiced the general wish of the members of the club in moving a standing vote of thanks to Mr. Peet for his effective work as president during the past year.

A very important feature of the meeting was the report of the committee which was earlier delegated to look into the matter of a fishing preserve for the Chicago Fly-Casting Club. This report was simply a motion for continuance, as the cold weather has prevented any active investigations, but it is the intention of the club to push the matter this spring, and it is now almost to be predicted that the Chicago Fly-Casting Club will within the year be the owner of house and grounds of its own on some fishing water within reach of Chicago. This movement will not lessen interest in the club contests or the tournament work, but it certainly is a step in the right direction. The Chicago Fly-Casting Club is working on legitimate lines, and represents a most commendable spirit in sportsmanship. Mr. Bellows, the new president, is an enthusiast and a hustler. He has good aid, and the club has the stimulus behind it of the general prosperity in business matters. The year of 1899 will be a great one for the Chicago Fly-Casting Club.

Flies for Michigan.

Mr. Norman Fletcher, of Chicago, an angler of very wide experience, both in the North and South, is good enough to send me the following note in regard to flies suitable for the waters of Michigan, and I hope this

may be useful to our Montana friend, who wishes information in regard to flies for Michigan and Wisconsin. Mr. Fletcher writes:

"I notice in the FOREST AND STREAM of this week an inquiry about trout flies. My experience in fly fishing for trout has been almost entirely in the State of Michigan. I have had the greatest success with the cowdung and sand fly. Have also used with good results professor, brown-hackle, coachman, willow, Ronald Stone and black-gnat with lead colored wings. Have some samples of the three last named, and if you care to see them will call and show them to you. They are old flies that I expect to use as samples to have others made by. I usually have to get the sand flies made to order, as I rarely find them on sale. Wm. Mills & Son, of New York, sent me some a few years ago that were about right. They had them in stock at that time. Have used many kinds of flies in Michigan, including some that were made in London, but the above named are about all I would care for. If you think the information contained in this letter is of interest to you or to your readers you are entirely at liberty to use same."

The Japanese Fly Fishing.

I have already heard favorable comment from many sources on the very interesting article given the FOREST AND STREAM by Mr. J. O. Averill this week on the Japanese method of fly fishing. I should have been delighted had I been able to read this paper at the banquet of the Chicago Fly-Casting Club, where I made brief attempt at verbal description of it. To-day Mr. Peet, ex-president of the club, called in at my office and said: "I want to see that Japanese fly which Mr. Averill sent you. That was a mighty interesting story that he wrote." I showed Mr. Peet the sparse-looking, angular little hook, and he said: "Well, that's an odd-looking thing, isn't it? Yet you see the distance from the barb of the hook to the back across the bend. That gives lots of holding room." I watched Mr. Peet very carefully, lest he should swipe my fly and go off at a run, but we compromised by my promising to let him see me catch a trout on that fly on the Prairie River some time next spring. I am sure I wish Mr. Averill might come out here and give some of our boys a lesson in fly casting after the Japanese fashion.

1200 BOYCE BUILDING, Chicago, Ill.

Mississippi Gulf Coast Resorts.

OCEAN SPRINGS, Miss., Feb. 13.—*Editor Forest and Stream:* Referring to inquiry from Reader Baston about the cero or kingfish, or as they are called here on the Gulf Coast, jackfish or cavalla, let me say that in ten years' residence in the South and fishing for them all along the coast, I have found that right out from Ocean Springs here is as good a place as any for them. The best season is during August, September, October and to about the middle of November. Sometimes they school as early as the middle of June, if the water is especially salty; but the best months are August and September. They run in weight from about 18 to 25 lbs., but will generally average between 20 and 22 lbs. They are fighters from the word go. Another big fish we have here is the tarpon or silver fish, which range in weight from 50 to 100 lbs., and even more, and give a man a good half-day's sport on the right kind of tackle; at least one feels like resting the remainder of the day after landing one. I enclose a scale from the last one caught here; it weighed 98 lbs. Fishing of all kinds is fine here nearly the year round.

As for oysters, well, you can imagine what one can do to them when you can buy them averaging between 3 and 5½ in. long and half as wide as one's hand at from 25 to 50 cents per hundred.

Red fish, speckled (sea) trout and sheepshead are biting well this winter, or were until this cold snap.

The hunting can't be beat. The woods are full of partridges and deer. Turkeys and squirrels are abundant within fifteen miles of here. A party from Red Creek, twenty miles north of here, reported last week's kill of deer at twenty-two. As for duck, since we have posted our preserves (about 25,000 acres), fronting on the Gulf, we have good duck hunting, teal, mallards, sprigtails, and others, while the bay is literally covered with black ducks, but a man wants a Gatling gun to get the black ducks, they are shot at so much. Snipe are very plentiful.

One can get boats here, either sail or launch; and take it all in all, I never found a place where one could have the variety of good sport there is right along the Mississippi Gulf Coast.

H. F. H.

Muscullonge Spearing.

THE annual muscullonge-spearing season for 1899 opened on Chautauqua Lake yesterday. From the viewpoint of the true sportsman it was a dismal failure; but from that of the man who wants to fill up on fish it was a complete success. The State law permits the spearing of these fine game fish for ten days each year—the open days being the Mondays and Thursdays for five weeks beginning the first Monday in February. By actual count there were 656 fish houses on the lake yesterday. The day was a perfect one for spearing. The ice was firm and the water clear. As a result, there was a great slaughter of fish. Hundreds of them were taken, ranging from 1 to 40 lbs. Not less than twenty-five fish were taken that would weigh 30 lbs. or more each. A large percentage of the catch, however, was of fish weighing from 2 to 4 lbs. each.

It is estimated that not less than three tons of these fine fish were taken out of the lake during the day. "A fish hatchery is maintained during the early spring for the propagation of these fish, and just why their ruthless slaughter is permitted by the State, which pays the expense of the hatchery, can hardly be explained," remarked an angler to-day. "It is permitted in no other waters of the State. The result cannot but be disastrous to the hook-and-line fishing of the summer. If the conditions remain favorable during the coming five weeks, it is likely that few muscullonge will be left in the lake at the close of the spearing season."—Buffalo Express, Feb. 7.

Yard Training a Puppy.

THERE have been published quite a number of books of more or less merit and length on the subject of dog training.

While it is not my intention to criticise any of the various methods employed by such authors, yet it is my desire to submit for trial a few ideas gleaned by practical experience in yard training a puppy before he enters the field for hunting purposes.

How many sportsmen of this country have paid fancy prices for a puppy, sent it to a practical trainer (?) and had it returned at the end of the season practically of no use (outside of the bird experience given) to the owner except to rebreak the dog at least to conform to the owner's individual ideas. Just here is the vital point at issue, namely, training a puppy and training a dog grown up are entirely different to do what each individual desires as a hunting dog. The owner of a fine puppy thinks he can pay a fancy price to a trainer, and all he has to do is turn the dog afield and the dog does the rest; that he will find all the birds and obey the many calls, yells and beatings he is sure to get upon his first trial. The question might be appropriately asked, Who is to blame, the trainer, owner, or the dog? To obviate all these trials, that have been the experience of many sportsmen, is the intention of this brief communication.

We will presume one has bought from a reliable kennel a puppy whelped in the spring, four months old, with certified papers as to his breeding. We advocate the purchase of a finely bred puppy, because experience has demonstrated the fact that you are more likely to get a good, intelligent animal from such sources; the time of one or two years you are to put upon the education and development of the puppy will more surely bear fruit; and it is less, or at least no more, trouble to raise a supposedly good one than a doubtful bad one.

The question naturally arises, Can any one train and develop a puppy? We believe it can be done, provided a little patience and perseverance are used on about these lines. We have received the puppy in good condition. Now, when shall we begin to yard break? While there are some differences of opinion, it seems that it really depends on each individual case. One being brighter mentally and of better physical development can be taught the rudiments right along until he is fully educated in dog lore and sense. Some puppies are like children. They must be handled carefully, or else you will find but little progress is made. Again, What system shall we employ? Shall we persuade the puppy by coaxing and petting him to come along, or shall we whip him, or shall we put a spike collar around his neck and by force drag him along? All these systems have their advocates. We must not forget that we are dealing with a puppy, and not a fully grown dog. We believe and advocate training your puppy by what is known as the force system, but differ as to the means employed to accomplish that end.

Study the characteristics of your puppy. First endeavor to learn if he is inclined to be bold or timid in his nature, so that you can then determine just how far you can force him to your will, yet at the same time not break his spirit.

The greatest delight of a puppy six to ten months old (like that of some people) is to eat. We will suppose you have him kenneled in a yard with wire netting about 6 ft. high in place of a fence. When feeding time approaches blow your dog whistle, to signal him you are coming. He will soon be on the outlook for you. Gain his confidence by gentle action and feed him yourself by all means.

The first lesson for him to learn is "Hold." Place part of his food before him and say in firm tones, "Hold!" and never allow him to eat until you say "Take!" If he is inclined to be a glutton and rushes to take his food before the command "Take!" strike him with your hand a gentle blow on the end of his nose and repeat "Hold, sir." This may cause him to sneeze, but it will never hurt him, and he will soon respect your command. Never allow him to do anything when you command him to "Hold" but hold; and also the same where the order "Take" is given. This is a vital first principle, if you desire to get complete control of your puppy, for the future command "Hold," when he attempts to break shot in the field. Continue this treatment until it becomes natural for the puppy not even to attempt to eat until the command "Take" is given. Never fail to impress upon him "Hold."

Next, take him out of his kennel in the yard and allow nothing around to distract his attention from you. Toss a piece of bread or meat out about 10 ft. from you, at the same time holding by collar the puppy, and say sharply "Hold." Then say "Hie on!" and when about 2 ft. from the meat command him to "Hold." Repeat until you make him do it, which will be easily accomplished if he has had his first "hold and take" lesson firmly ground into him.

The next lesson to teach him is to "Charge," meaning to lie down. This can be best accomplished by raising the hand as if to strike him, at same time giving him a jerk with his collar down and out to throw him. When down make him (by placing him) lie down on his belly, not on his side and feet in air, puppy-like. When this position is assumed rise up and repeat the command, "Charge, sir," with threatening motion of hand. A puppy watches action of hand and voice together better than one or other singly.

This lesson is soon acquired, and you have not up to this time, bear in mind, used either whip, choke-collar or persuasion, but simply pure will force.

Having taught him to "charge," throw your bread out. First command, "Charge, sir." He lies down. Then command, "Hie on," and when near the object of his desire command "Hold," and have him hold for a moment or more. Then command "Take," and while he is eating fondle and pet him in approval. The puppy likes petting at the right time, just as a person likes commendation for an accomplishment of a good action.

Continue this training until you are satisfied you have the puppy under complete control. Some will say: "Faulty; because when you try him outside of something to eat he will not obey your orders." This is a fallacy, if you have properly obtained control of the puppy.

Now begins the next stage of his education. Teach him the scent of a quail, the bird he is to hunt for you and his natural instincts crave. Procure a dead quail to teach him his lesson in retrieving, as you generally can buy in market such a bird. Some advocate a pad or cob (never a stick nor ball), both of which are useful if you can't get a quail; but the natural thing to do is to get right at what the dog naturally wants to do. For the first lesson command the puppy to "Charge." Place him on your right side, head to front. Pass your right hand over his muzzle and seize with right hand and fingers and thumb his upper lips and press his lips inward upon his sharp puppy teeth. He will open his mouth to howl. Then insert the quail in his mouth and hold it there with left hand, closing down on his muzzle, at same time commanding him to "Hold it, sir." Offer him the quail to "Take it, sir." He will refuse. Punish him by pinching his lips on his teeth, and when he opens his mouth insert the quail (or pad made out of canvas 2 by 4 in. long). Continue this treatment until he is forced to take or hold the quail in his mouth with hands off his muzzle until you command him to "Drop, sir," by touching him under lower jaw with hand to drop it in your hand.

The next lesson is to throw out the quail or pad. First command him to "Charge;" then command "Hie on; fetch dead," at the same time waving the hand indicating direction for him to go. You will soon note that his eye will follow your every motion. If he refuses to go and fetch, pinch his mouth as indicated; at the same time force him along by his collar to the quail. This is severe punishment and the puppy soon is forced by this method to do your bidding.

After you have taught him to fetch in and drop in your hand, teach him to hold the quail in his mouth and follow you around the yard, carrying the quail awaiting your command to "Drop, sir," at the same time extending your hand to receive the bird. This teaches him to retrieve to you alone, and to hold until told to drop the bird. This will prove especially useful when shooting in briars or high weeds, as we have seen a dog start to retrieve a bird, some one shoot and kill one, and the dog drop the dead one to go and get the newly killed one.

Having thoroughly ground in the dog's training to these simple yard-breaking rules, you can then expect to have full control of your dog when you begin his field training, which then resolves itself into a pleasure to see the benefit his early teachings have developed. Any one who thus handles his puppy can expect to enjoy an outing, as the dog and owner now fully understand one another and depend upon each other in their mutual enjoyment of hunting quail. The dog will then look to you and obey your commands, and there will be no need of continual whistling and hallooing "Come here, sir," and thrashing him with whip or stick. This is a source of the greatest annoyance to both hunters and dogs. They soon get rattled and don't know what to do. Your dog has been trained up by yourself and he will not pay any attention to any one but to your own express commands.

A word as to the best food for a growing puppy. We advocate the purchase of a small quantity, say 5 lbs., of beef neck. Have it stewed until all the beef juice is extracted in liquor in pot. Then strip bones off the meat, discard the cooked bones, but let remain in stew the meat. Take equal parts of corn meal and coarse wheat flour; mix and stir in the soup until thick enough to mould out into pones. Then put these pones or cakes into the oven and cook them well done. This makes the best and strongest food you can buy, and it is cheap. This broken up and mixed in half a gallon of buttermilk twice a week will make a puppy healthy and free of worms.

When you go hunting take along a cake of this preparation to feed your dog. Treat him kindly and feed him well. When you ride him home from a long day's hard hunt feed him plenty and house him warmly. He is your companion in the field, and it depends upon your individual training him and caring for him if you expect to get the best and highest results he is capable of in the field. When hunting your dog, say three or four times a week, always feed him these cakes and plenty of the food. His system under such strain requires heavy feed to restore the wasted energy. Even with the best of care, thus hunted he will show thin, but if he is thin and hardened, having had good food and plenty, he is the much better able to withstand a hunt, not of a field trial, a few minutes or even an hour, but two or three days as a genuine hunting dog, that will be a pleasure to follow; and you may then enjoy to the utmost the great delights found afield with your own broken dog and gun.

New Publications.

The Adirondack Spruce.

UNDER this title the Critic Company have published a little volume containing an exceedingly interesting study of the forest in Ne-ha-sa-ne Park by Mr. Gifford Pinchot, United States Forester, who, in the limits of 150 pages, has given us a collection in facts and figures which are of the highest practical use.

Forestry in America is young, and while for many years a small body of men interested in forest preservation have preached the doctrine of forest preservation, they have often done it with so little judgment as to arouse only hostility on the part of the practical lumbermen. Mr. Pinchot, however, holds the undeniable view that forest preservation and the lumber interest are bound together by the closest ties, and that the forest must be preserved in order that its ripened product shall be harvested and marketed intelligently, so that fresh crops of timber may be continuously produced. When the time shall come that the lumbermen believe this to be the object of forest preservation, they, of all men, will be the most enthusiastic in their devotion to its cause.

The study of the forest described in this book was carried on between December, 1896, and September, 1897, under the management of the Division of Forestry of the U. S. Department of Agriculture. Its object was the preservation and proper management of spruce timber in the northeastern United States. The original forests cannot long continue to supply the demands which are made on them, and there is pressing need that subsequent crops of this valuable timber should be provided for, lest the industries which depend on it should be crippled in the near future.

The book is divided into two parts, the first containing

a description of the forest studied, of the spruce there and its method of growth, of the spruce in mixture with other trees, of the associated trees, of the lumbering, and of the basis on which the forest should be managed. Following this are series of volume tables, valuation surveys and yield tables, as to the spruce and as to associated species. The second part of the book is the Working Plan. It treats of topography and climate, transportation, reasons for forest management, treatment of the forest, cutting and returns. There is an appendix giving fourteen valuation surveys, measured on cut-over land, at Santa Clara, N. Y., in different situations and soils. There is a very complete index.

Perhaps no work more useful for forestry has ever been undertaken in this country than the study which this little book represents, and the publication of its results. "The Adirondack Spruce" should be in the hands of every landowner in the country who has a piece of woodland on his place; for the information which it contains about forestry management in general and about the Adirondacks in particular is of very great interest and value.

Yachting.

As the yachting journal of America, the *FOREST AND STREAM* is the recognized medium of communication between the maker of yachtsmen's supplies and the yachting public. Its value for advertising has been demonstrated by patrons who have employed its columns continuously for years.

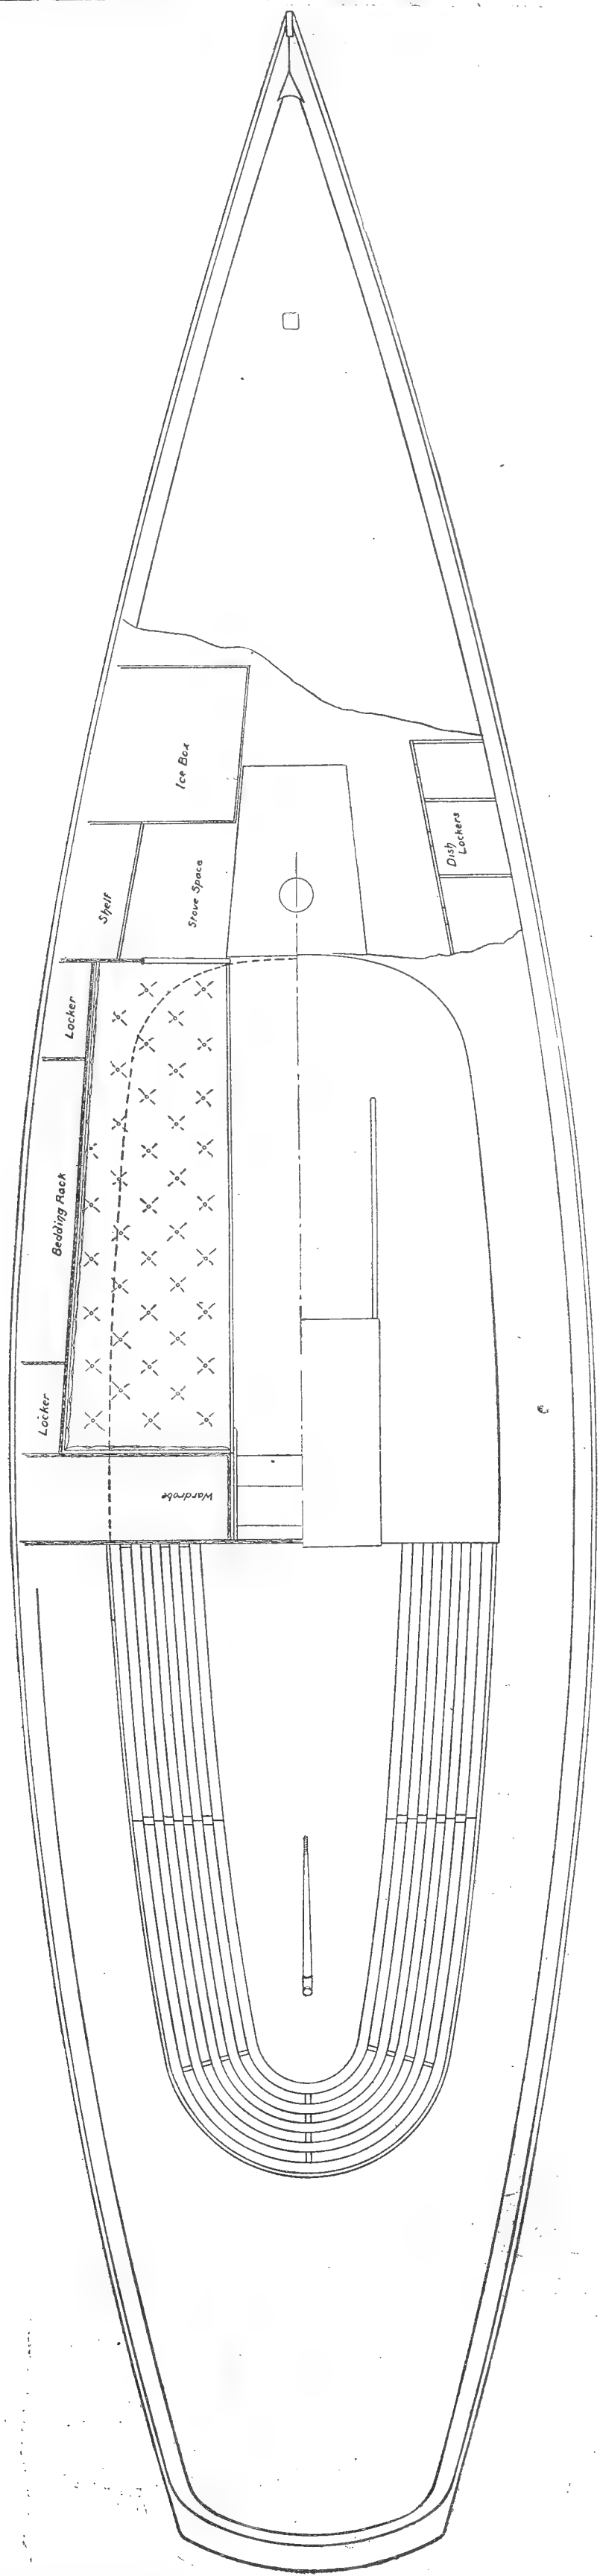

An English View of American Yachting.

The following, from the London Field, is not intended to be funny. The historical portion may pass, though as a matter of strict accuracy the capsizing of Mohawk in

1876, and of not one, but many, smaller centerboard craft, had no immediate effect. These unfortunate occurrences were explained in a way and glossed over by the majority of American yachtsmen, all firm believers in the shoal centerboard sloop. They did, however, serve a good purpose incidentally as a fulcrum for the lever by which the original "cutter cranks"—and we are glad to say that we were one of these—finally introduced the deeper model with lead keel and cutter rig.

When it comes to geography the Field is sadly mixed. If the New York Y. C. desires to introduce a pleasing novelty into its cruise this year, it might plan it so as to sail from a prayer meeting, through "Humphrey's Hole" and up "the Fall River," by way of extra diversion, some appropriate nautical ceremonies might be introduced when the fleet crosses the Fall River Line.

"FOREST AND STREAM" continues to publish drawings of small racing and cruising yachts; but they are monotonously of the same pattern, though all are of shapely form, and as they have lead keels, slightly bulbed, they are a great advance on the old centerboard skimming-dish type. This is a come-down after all that has been said by Americans (devoted yachtsmen especially) in favor of the centerboard; but the capsizing of the Mohawk and that of another yacht (the name of which we forget) opened their eyes to the value of depth and a lead keel. Mr. Burgess, an American designer, recognized the value of these elements and, aided by encouragement from Mr. Malcolm Forbes and Gen. Payne, (?) designed Puritan and Mayflower as 'compromise' craft; that is, they had heavy lead keels, good draft, and were fitted with a very small centerboard. (?) It will be remembered that Volunteer and Vigilant were also of this type; but Vigilant, at any rate, revolted against the centerplate and finally dropped it at the western extremity of the Isle of Wight. It is to be regretted that Americans do not go in for racing large or medium-sized yachts more sys-

KNOCKABOUT, DESIGNED AND BUILT FOR MESSRS. E. I. & W. L. CROPLEY, BY W. B. STEARNS, 1899.

tematically; but rivalry among themselves appears to be quite dormant, and only shows signs of life during the festive cruise of the New York Y. C. down Long Island Sound in August.

"Of course this is very delightful yachting, and the stay at New Bedford, New London and Newport is always pleasant. Then comes the sail through "Humphrey's Hole" to Martha's Vineyard, and on to Edgar Town, one of the primitive English settlements, and now the home of the codfishing men and some pilots. The serenity and neatness of the pretty little seaside village is beyond comparison, and perhaps this is enhanced by the infrequency of posts and the absence of morning and evening newspapers. It is quite an old-world place, and any Englishman visiting America in a yacht should see it; also Martha's Vineyard if in the August-September season, when the prayer meetings are raging there. Of course, the passage up the Fall River is equally interesting, especially on account of its associations with the early English settlers on the east coast."

Yacht Designing.—XXIV.

BY W. P. STEPHENS.

(Continued from page 112, Feb. 11.)

The illustrations accompanying this article are copyrighted by the Keuffel & Esser Co., New York, to whom we are indebted for their use.

THE cardboard scales are necessarily flat, but scales of wood, ivory or metal are of three forms, Fig. 56, a, flat with single bevel; b, flat with double bevel, and c, triangular. The first has one flat side next the paper, with each of the upper corners cut away on a sharp bevel and divided, the two graduated edges thus giving two or sometimes four different scales.

The second shape has a double bevel to each edge, giving four surfaces for graduation. This form of scale is very inconvenient in use, as it never lies flat on the paper,

comparing different drawings, and in studying the many designs now available through the different yachting books and journals. Even if the correct scale is given on the drawing, which is not always the case, it may be desired to compare the drawing with another by means of a different scale; for instance, any good design of a 21ft. yacht can, by means of the proper scale, be converted into a 25-footer. For all such uses the paper scales are

Fig. 60—Semi-circular Protractor.

quite accurate enough, and a good assortment of them is desirable; but for original work some wood scales of the usual divisions, 1in., $\frac{1}{2}$ in., $\frac{1}{4}$ in., etc., are to be preferred.

The diagonal method of division is very convenient in making a plain scale on a drawing, or in laying down any new scale. A line is drawn and divided into a certain number of equal parts; for instance, if a scale of $\frac{1}{2}$ in. to the foot is desired, the line may be divided into twenty-one parts, each $\frac{1}{2}$ in., as A, B, Fig. 57. From each point of division a perpendicular is now dropped, or in other words, a line is drawn at right angles to the first line. A series of ten lines, equidistant, and parallel to the first line, are now drawn. One of the end divisions is now subdivided into ten equal parts on the upper and lower of the parallel lines, each point being numbered as in the

Fig. 57—Diagonal scale; decimal divisions.

Fig. 58—Diagonal scale; duodecimal and eights.

Fig. 59—Vernier scale.

but must be held by one hand at a certain angle; it answers very well for a scale to be carried in the pocket, but it has no proper place in the drafting room.

The triangular scale has the advantage of a large number of surfaces for graduation, six in all on its three edges, and at the same time there is always one surface that lies flat on the paper while the particular scale in use at the time is held at an angle of 60 degrees, a very convenient one for reading and marking. The standard triangular architect's scale, has one edge divided into inches and sixteenths for its entire length, or divided to $\frac{1}{2}$ in. to the foot from left to right, and to $\frac{1}{4}$ in. from right to left; one edge to $\frac{3}{8}$ in. and $\frac{3}{4}$ in.; one to $\frac{1}{2}$ in. and 1in.; one to $\frac{1}{4}$ in. and 3in., and one to 2 and 4in.; or eleven different scales in all.

In working on any given drawing, there is a material saving of time in having the proper scale and no other at hand, so that it may be applied to the work as soon as it is picked up, without studying and turning to find the right scale on one of several edges. Except in the case of the cardboard scales, this is seldom done, however, as it would call for a very large and costly collection. In this particular the single-bevel flat scales are the best of all, as there is but one side uppermost, and the required scale must be on one of its two edges. The triangular scale is the most inconvenient of all, as some one of the ten scales not wanted is sure to be in the place of the right one, and the scale must be constantly watched and turned. On the other hand, however, this form of scale has two distinct advantages, it contains all the graduations in common use, and the face of the scale lies at a convenient angle, while the edge is brought much closer to the paper than in the flat scale. In the improved form of triangular scale, the angle of each pair of edges is made a little less than 60 degrees, so that while the extreme edge touches the paper, the graduated surface is raised so as to protect it from wear. For accurate work and very fine division, the metal triangular scale is superior to any other form and material, the marking point, either a hard pencil or a steel pricker, may be run down the fine line of graduation, even to 1-100 of an inch, with extreme accuracy. The triangular scale may be fitted with a small handle of bent metal, which helps to prevent confusion, as it shows which side should be in contact with the paper and which edge uppermost.

A large assortment of scales is of great convenience in

figure. A diagonal or inclined line is now drawn, from the point marked 0 on the upper line to a on the lower, and through each of the other points on the upper line is drawn a parallel line, 1, b; 2, c; etc. In crossing the ten parallels, the first inclined line, 0, a, gains 1-10 of the prime division, consequently in crossing the first parallel

Fig. 61—Protractor and Plain Scale.

(Copyrighted by the Keuffel & Esser Co., New York.)

it gains one-tenth of this distance, or 1-100 of the prime division. In crossing the second parallel it has gained two-tenths, and so on to the complete distance on the lowest parallel. Suppose the dividers to be placed on the point representing 5ft., the other point being on 0, the distance measured is 5ft. Now if the dividers be moved

Fig. 56—a, single bevel scale. b, double bevel scale. c, triangular scale.

down to the next parallel and opened so that the two points are each on its respective vertical and diagonal, the distance will have been increased by 1-100 of the prime unit. In Fig. 57 the dividers are shown on the fourth parallel, the sixth vertical, and the third diagonal; the reading, therefore, is: Six feet, three tenths of a foot, and four hundredths. The rule for measuring from such a scale is, place the dividers on the intersection of the parallel indicated by the third figure and the diagonal indicated by the second figure, moving the other point to

the vertical indicated by the first figure. The diagonal scale was in very common use by the old shipwrights, and will be found in all old books and drawings. It is easily constructed to any desired scale, and is useful in taking off measurements for calculation, which must be in feet, tenths and hundredths, and not in inches and fractions. The diagonal scale may be constructed with duodecimal divisions, giving feet, inches and fractions of an inch, Fig. 58.

The vernier scale is a device for reading to smaller subdivisions than can be conveniently marked and read on the scale itself. In its most common form it consists of a small auxiliary scale, sliding beside the main scale. Assuming that the main scale is divided into tenths of an inch, then on the vernier a distance equal to nine of these divisions of the main scale is laid off and divided into ten equal parts. It will be evident then that each division on

the vernier is equal to 9-10 of a division of the main scale; in other words, each division of the main scale exceeds by 1-10 a division of the vernier. If the two scales be adjusted so that the 0 on the vernier coincides with any point of division of the main scale, as 10 in Fig. 59, a, the reading is simply 10. If the vernier be moved to the right until its first division coincides with 11 on the main scale, it will be evident that the distance now denoted by the 0 of the vernier is greater than before by 1-10. Successive movements of the vernier to the right will show an increase of 1-10; as the point 2 on the vernier coincides with the point 12 on the main scale, the excess beyond 10 becomes 2-10; for 3 and 13 respectively, 3-10, etc. Fig. 59, b, shows a reading of 10.18; the mark 8 on the vernier being nearer than any of its fellows to some one mark of the main scale.

The difference between the length of a space on the main scale and that on the vernier (in this case 1-100) is called the *least space*, and must be equal to one space of the main scale divided by the number of spaces of the vernier. In using any instrument with a vernier, the distance to be measured is marked by the 0 of the main scale, and the 0 of the vernier; when the instrument is

adjusted to the distance, the division of the main scale immediately preceding the vernier must be read, then follow the vernier until that one of its divisions is found which coincides most nearly, if not exactly, with some one division of the main scale; the number of this division gives the required fraction, to be added to the reading of the main scale. The vernier is found on the planimeter, integrator, protractor, sextant, barometer and many other instruments in common use by navigators, surveyors, draftsmen and mechanics.

The *protractor* is literally a circular plotting scale, *full-divided*, a circle or semicircle of horn, metal or cardboard with the center marked and the edge divided into 360 equal parts, or degrees. For ordinary use the smallest division is $\frac{1}{4}$ or $\frac{1}{2}$ of a degree; but the most elaborate protractors, with revolving arm and vernier, may meas-

ure to a minute. For the yacht designer, the ordinary printed Bristol board protractor of 6 to 8 in. diameter, costing 20 to 30 cents, is quite as good as the silver instruments costing as many dollars. Two forms are shown in Figs. 60 and 61.

The scale should never be used as a straight edge, as a rule its edges will not be perfectly true, but in selecting scales they should be carefully examined as to their freedom from warping and twisting, and if of wood it should be of clean straight grain, and free from knots; the better the wood is, the less liability to subsequent warping. The graduations should show clean sharp lines and even spacing. It is surprising how plainly the most minute irregularities are apparent to the practiced eye, and what an annoyance they cause to one accustomed habitually to accurate measurements. The work of the best scale makers is now so close to the Government standards that their scales compare accurately one with another, and may be used together on the same drawing. It sometimes happens, however, that after a drawing is plotted with one scale, another one of different make is used for convenience in taking off the offsets or for similar work, and shows a perceptible discrepancy in the results. Wherever practicable, it is well to buy all scales of one reliable maker.

Atlantic Y. C.

The annual meeting of the Atlantic Y. C. was held at the Waldorf-Astoria on Feb. 14, with Vice-Com. B. M. Whitlock in the chair, Com. Adams being snowbound at Wilmington, Del. The following officers were elected: Com., F. T. Adams, schr. Sachem; Vice-Com., Benjamin M. Whitlock, aux. steam yacht Hildegard; Rear-Com., Edward Weston, steam yacht Wachusett; Sec'y, David E. Austen; Treas., Howard P. Frothingham; Meas., George Hill; Trustees, George J. Gould, Harrison B. Moore, Calvin Tomkins, Thomas L. Watson, J. A. Mollenhauer and Bartow S. Weeks; Regatta Committee, David E. Austen, John L. Bliss and Louis F. Jackson; Committee on Membership, Spencer Swain, J. M. Ceballos and Frank Sperry; Library Committee, J. M. Foote, Arthur G. Allen and J. Wallace Morrell; Entertainment Committee, Frederick E. Camp, J. M. Tappen and Calvin Tomkins; Nominating Committee, Jefferson Hogan, Robert P. Doremus, Thomas Barrett, John Cortledge, S. E. Vernon and David H. Valentine. The report of the officers showed a very prosperous condition, the membership having increased during the year from 483 to 633, and the fleet from 250 to 257 yachts. The three flag officers each offered cups to the value of \$250, and Mr. George J. Gould has offered the same amount as he gave last year, \$1,500. The regatta committee carried over a surplus of \$1,225 last year, so that the club will have ample funds for the encouragement of racing.

The date of the annual regatta was fixed for Tuesday, June 20.

The following amendment to the constitution was passed:

Any member who shall have duly qualified as an active member of the club may become a life member upon payment of \$250, until the total number of such life memberships shall be fifty in number, and thereafter by the payment of \$400, until the total number of life memberships shall be 100 in number. These payments shall be in lieu of all further annual dues.

This amendment to become valid must be adopted by a two-third vote at the next meeting of the club.

Sections 1 and 2 of the by-laws, referring to "initiation fee," were amended as follows:

Section 1.—The entrance fee shall be \$50, upon the payment of which and the annual dues, as hereinafter provided, members elect shall become entitled to all the privileges of membership.

Section 2.—The annual dues shall be \$40; payable \$20 on Feb. 15 and \$20 on Aug. 15 in each year. Members elected prior to Aug. 15 in any year shall be liable for the full amount of the current yearly dues. Members elected on or after Aug. 15 shall be liable for only one-half of the current yearly dues.

Any member who shall be absent from the United States for the whole fiscal year, commencing on Feb. 15, shall be exempt from the payment of annual dues, providing he gives notice of his absence to the secretary.

MEETINGS.

Chapter 4, Section 1, was amended to read:

Section 1.—Regular meetings of the club shall be held on the second Monday of February and June. The meeting in February shall be termed the annual meeting.

The rest of this section remains as before.

Messrs. C. T. Pierce, N. D. Lawton and Sec'y Austen were appointed a special committee to finally revise the new racing rules, which were formally adopted.

A Fast Cruising Knockabout.

(Concluded from page 189, Feb. 18.)

THE accompanying illustrations show the interior arrangement, details of construction, and sail plan of the knockabout, whose lines were published last week. The yacht is intended mainly for day sailing and racing in the handicap class, so a good deal of space has been given up to the cockpit; but there is still a very snug cabin, completely fitted with lockers, closets, ice chest, galley with Primus stove, dish lockers, etc., so that two persons can make themselves very comfortable on a cruise. The interior finish is butternut, the cockpit being fitted with removable slat seats of mahogany, to match the staving. The yacht will have two rigs, knockabout and raceabout, which can be shifted one for the other in half an hour, the same mast being used for each rig.

The construction is of the best class of single-skin caulked seam work, to the scantling limits of the knockabout class. The planking is of selected white cedar, fastened with copper, riveted, the upper strake being of Nova Scotia oak in a single length, bright finished. The planksheers are also of oak, and the deck is of Oregon cedar, ship-lapped, and payed with Jeffries marine glue. The cabin top is of double thickness, an inner skin of 1/4 in. butternut, to match the cabin joinerwork, and an outer skin of Oregon cedar, laid close-seam, with cotton and white lead between.

All of the deck and spar fittings are of Manganese or

other bronze; polished. The sails are by Cousens & Pratt. Mr. Stearns has also in hand another yacht of similar design and identical arrangement and construction, for the market. The cost of these boats is about \$1,300.

Willada.

THE steel steam yacht building at Pusey & Jones' yard, Wilmington, from the designs of H. C. Winttingham, is for Col. Wm. Hester, of Brooklyn, owner of the sloop Wizard. The new yacht, to be named Willada, will be 128 ft. over all, 102 ft. l.w.l., 16 ft. 6 in. beam, 9 ft. 9 in. depth of hold, and 6 ft. draft. She will have a triple expansion engine 9, 14 1/4 and 23 1/2 by 14, with an Almy boiler.

YACHTING NEWS NOTES.

The annual meeting of the Larchmont Y. C. was held on Feb. 15 at Delmonico's, New York, with Com. Postley in the chair, the following officers being elected: Com., Clarence A. Postley; Vice-Com., Edward S. Hatch; Sec'y, A. Bryan Alley; Treas., William Murray; Meas., John Hyslop; Trustees, to serve for three years, Francis M. Scott and Eugene L. Bushe, and Oswald Sanderson, trustee to serve for one year, to fill vacancy. Mr. Albert J. Morgan, who was nominated for Rear-Com., withdrew his name prior to the meeting, and the vacancy will be filled later. Com. Postley was instructed to appoint a committee to confer with the Yacht Racing Union of North America with reference to the adoption by the club of the girth measurement.

The Kingston Y. C., of Kingston, Mass., held its annual meeting on Feb. 11, and elected the following officers: Capt. John Dawes, Com.; Capt. Nathan B. Watson, Vice-Com.; Capt. Justus A. Bailey, Fleet Capt.; Henry M. Jones, Sec'y; Lemuel R. Ford, Treas.; Edward A. Ransom, Meas.; John C. Dawes, Alexander Holmes, Charles H. Drew, George W. Shivers, Waldo S. Cole and Joshua Delano, Jr., Executive Committee; Com. Dawes, W. S. Cole, Philemon Maglathlin, Harry I. Cole, E. A. Ransom, Fred C. Bailey, Regatta Committee.

Ægusa, steam yacht, has been sold by Count Ignazio Florio, of Palermo, to Sir Thomas Lipton, who will use her in connection with the Cup races at New York. The yacht was designed and built by Scott & Co., of Greenock, in 1886, and is 264 ft. 9 in. b.p., 252 ft. l.w.l., 31 ft. 8 in. beam and 18 ft. 6 in. depth of hold, 1,242 tons. She was reported as purchased by the United States Government just prior to the war, but the sale was cancelled owing to the impossibility of delivering her before war was formally declared. She is said to have cost £60,000, and to have sold for £80,000.

The Staten Island Y. C. has elected the following officers: Com., Hugo J. F. Lindeman; Vice-Com., C. T. Wigand; Sec'y, Edward S. Seguire; Treas., Ferdinand Roettger; Meas., Adolph Panick; Trustees, Howard Hitchcock and William H. Ludlum.

The New Rochelle Y. C. held its annual meeting on Feb. 6 at the Hotel Manhattan, New York, the following officers being elected: Com., Eugene Lambden; Vice-Com., James Fallert; Rear-Com., E. T. Birdsall; Sec'y, O. W. Meyrowitz; Treas., A. S. Cross; Meas., F. R. Farrington; Law Committee, C. E. Keene, John F. Lambden; Regatta Committee, C. P. Tower, Paul A. Meyrowitz, Joseph Lippincott, A. P. Weston, William E. Moore; Trustees (three years), Edwin Shuttleworth, Charles M. Fletcher; Trustee (two years), E. T. Smythe.

Rifle Range and Gallery.

The National Sportsmen's Association.

THE programme of the Grand Championship Rifle Tournament of the Fifth Annual Sportsmen's Show, at Madison Square Garden, New York City, March 2 to 15, 1890, under the auspices of the National Sportsmen's Association, is appended. The ranges are open from 2 P. M. until 11 P. M. each day, except Wednesday, March 15, when all shooting will close at 9 P. M. sharp.

Individual Championship Match, open to all—100 shots off-hand; 25-ring target; distance, 100 ft. Any .22cal. rim-fire rifle allowed. Entrance \$5, including season ticket of admission to the Sportsmen's Show. Only one entry allowed each competitor. To be shot in strings of ten shots. Competitors can shoot their ten strings during the tournament as they desire.

Prizes: First prize, Championship trophy and \$20; second, \$25; third, \$20; fourth, \$15; fifth, \$12; sixth, \$10; seventh, \$8; eighth, \$6; ninth, \$5; tenth, \$4; eleventh, \$3; twelfth, \$2.

Each winner can take either his cash prize or its value in a trophy.

Entries for this event will be received by any member of the rifle tournament committee, or by J. A. H. Dressel, secretary-treasurer of the Sportsmen's Association, No. 280 Broadway, New York City.

Continuous Match, open to all—Off-hand, on 25-ring target. Distance, 100 ft. Any .22cal. rim-fire rifle allowed. Entrance for ticket of three shots, 50 cents. Re-entries unlimited, but only one prize obtainable by any one shooter. Two best tickets to count for prizes.

Prizes: First, \$50; second, \$35; third, \$25; fourth, \$20; fifth, \$15; sixth, \$12; seventh, \$10; eighth, \$8; ninth, \$7; tenth, \$6; eleventh, \$5; twelfth, \$4; thirteenth, \$3; fourteenth, \$2; fifteenth, \$1; sixteenth, \$1; seventeenth, \$1; eighteenth, \$1; nineteenth, \$1; twentieth, \$1; twenty-first, \$1; twenty-second, \$1; twenty-third, \$1; twenty-fourth, \$1; twenty-fifth, \$1; twenty-sixth, \$1; twenty-seventh, \$1; twenty-eighth, \$1; twenty-ninth, \$1; thirtieth, \$1.

Premiums: For the best five tickets, \$5; for the second best five tickets, \$4; for the third best five tickets, \$3.

Point Target or Practice Target, open to all—Five shots for 25 cents. The shooter scoring sixty points will be entitled to a fine trophy. Shooting off-hand; tickets unlimited. Trophies can be seen at the range.

Bullseye Target, open to all—Off-hand, on 4 in. bullseye. Distance, 100 ft. Any .22cal. rim-fire rifle allowed. Entrance, 50 cents per ticket of three shots; re-entries unlimited. The best single shot by measurement to count. Only one prize obtainable by any one shooter.

First, \$25; second, \$15; third, \$10; fourth, \$8; fifth, \$7; sixth, \$6; seventh, \$5; eighth, \$4; ninth, \$3; tenth, \$2; eleventh, \$1; twelfth, \$1; thirteenth, \$1; fourteenth, \$1; fifteenth, \$1; sixteenth, \$1; seventeenth, \$1; eighteenth, \$1; nineteenth, \$1; twentieth, \$1; twenty-first, \$1; twenty-second, \$1; twenty-third, \$1; twenty-fourth, \$1; twenty-fifth, \$1.

RULES.

A shot must cut the ring to count. All targets will be counted and entered by the official scorer, and will be returned to the shooter in case there is no dispute. The referee committee will decide all matters pertaining to doubtful scores. Any sights except telescopes allowed.

All questions in dispute not covered by these rules will be decided by the referee committee. Messrs. Zettler Bros. will have charge of the ranges, and will furnish rifles and suitable ammunition free to all competitors. All kinds of .22 rim-fire ammunition will be on hand.

Tournament committee: H. D. Muller, chairman; G. Zimmermann and C. G. Zettler.

Address all correspondence to J. A. H. Dressel, secretary-treasurer, 280 Broadway, New York City.

Shell Mound.

SAN FRANCISCO, Feb. 13.—Editor *Forest and Stream*: A beautiful day greeted the numerous marksmen at Shell Mound range yesterday. The feature of the afternoon was the contest between P. P. Schuster and Dr. L. O. Rodgers in the Germania Club medal contest. Only one entry per month, 20 shots, 25-ring target, 200 yds., are the conditions of this contest. Schuster won high score with 447 rings to Dr. Rodgers' 444, the latter getting in a bad "flyer," a 11. Score of the Germania for the day were:

First champion class, F. P. Schuster, 447; second champion class, R. Stettin, 336; first class, Henry Stelling, 422; second class, August Jungblut, 382; third class, John Beutler, 339; best first shot, E. Goetze, 24; best last shot, John Utschig, 21.

Bushnell medal: F. P. Schuster 220, J. Utschig 219, D. B. Faktor 217, Dr. L. O. Rodgers 216, A. Strecker 216.

Three shots, competition for cash prizes: D. B. Faktor 72, C. F. Rust 71, William Goetze 70, A. Strecker 69, John Utschig 69, Henry Stelling 68, Louis Haake 67.

Scores of the Columbia Club:

Columbia target, 200 yds.; experts: F. E. Mason 60, Dr. Rodgers 62, F. O. Young 63, Sharpshooters: G. M. Barley 69, O. A. Bremer 77, M. J. White 115, Marksmen: G. Mannell 93, E. W. Moore 99, Mrs. Mannell 115, J. P. Cosgrave 153, C. Roberts 165, J. J. Fitzpatrick 176, Glindeman rifle medal: F. O. Young 60, A. H. Pape 60, E. W. Moore 78, O. A. Bremer 81.

Pistol range, 50 yds., Columbia target; experts: G. M. Barley 38, J. E. Gorman 44, M. J. White 57, F. O. Young 66, Sharpshooters: F. E. Mason 67, J. P. Cosgrave 71, C. Roberts 78, Marksmen: Mrs. G. Mannell 102, J. J. Fitzpatrick 106, George Mannell 124, J. F. Twist 126, Lewis revolver trophy: C. Roberts, 75, 81, 111, 128; F. L. Lewis, 128, Siebe all-comers' pistol medal: G. M. Barley 46, 62, 72; J. P. Cosgrave, 67, 71; F. O. Young, 51.

Twenty-two and twenty-five rifle, Daiss all-comers' and Jacobson medal for members: F. L. Lewis, 67, 92; George Mannell, 27, 32, 33, 35; J. F. Twist, 53, 73; C. Roberts, 40, 31, 41, 49.

Scores of the Schuetzen Verein:

Champion class, F. P. Schuster, 417; first class, C. F. Rust, 405; second class, not filled; third class, Henry Stelling, 379; fourth class, D. Salfeld, 356; best first shot, C. F. Rust, 21; best last shot, John Utschig, 21.

ROEEL.

Conlin's Tournament.

THE present year is the thirty-fifth one I have been proprietor of a shooting gallery in New York city. A number of my friends and patrons have suggested that I celebrate the event by holding a shooting tournament. I have decided to act on this suggestion, and beg to announce that on Feb. 25 I shall open at my gallery, Broadway and Thirty-first street, New York, the Sportsmen's Jubilee tournament, for rifle, pistol and revolver, which will continue until March 18. This event will be unique in its character. Many of the prizes have been contributed by gentlemen who have been closely identified with shooting matters in this country and in Europe for the past quarter-century. Full particulars will be announced later.

JAMES S. CONLIN.

Trap-Shooting.

If you want your shoot to be announced here send in notice like the following:

Fixtures.

Feb. 13 and 22.—Newark, N. J.—On Lincoln's and Washington's birthdays respectively, on Smith's grounds, Foundry street and Ferry street, a 15 live-bird event each day; open sweepstakes also; class shooting.

Feb. 21-22.—Garden City, L. I.—Amateur championship contest under the auspices of the Carteret Gun Club.

Feb. 22.—Fremont, Neb.—All-day shoot of the Fremont Gun Club; targets and live birds.

Feb. 22.—Rochester, N. Y.—Live-bird and target shoot of the Rochester Rod and Gun Club.

Feb. 22.—Lebanon, Pa.—Keystone Gun Club, of Lebanon, Pa., all-day live-bird and target tournament; open to all. A. E. Smith, Captain.

Feb. 22.—Altoona, Pa.—Target tournament of the Altoona Rod and Gun Club. G. G. Zeth, Sec'y.

Feb. 22.—New Haven, Conn.—New Haven Gun Club's tournament; \$20 added money. J. B. Savage, Sec'y.

Feb. 22.—Worcester, Mass.—Tournament of the Worcester Sportsmen's Club; targets. A. W. Walls, Sec'y.

Feb. 22.—Lebanon, Pa.—Keystone Gun Club's live-bird and target tournament.

Feb. 22.—Dexter Park, Brooklyn.—All-day open shoot at live birds. H. S. Lippack, Manager.

Feb. 28.—Lyndhurst, N. J.—Live-bird tournament of the Brooklyn Gun Club. John Wright, Manager.

March 1.—White Plains, N. Y.—Fifteen live-bird handicap, \$10 entrance, birds included. E. G. Horton, Manager, White Plains.

March 2.—West Chester, Pa.—West Chester Gun Club's annual shoot for a Remington hammerless. F. H. Eachers, Sec'y.

March 2-11.—Madison Square Garden.—Tournament in connection with Sportsmen's Exposition. Address, Sportsmen's Exposition, 280 Broadway, New York.

March 25.—Pawling, N. Y.—Postponed shoot of the Pawling Rod and Gun Club. Geo. S. Williams, Sec'y.

March —.—Brooklyn, L. I.—Monthly shoot of the Brooklyn Gun Club. John Wright, Manager.

April 4-5.—Chambersburg, Pa.—Chambersburg Gun Club's spring live-bird and target tournament; open to all. J. M. Runk, Captain.

April 6-8.—Utica, N. Y.—Fulford's handicap at live birds. E. D. Fulford, Manager.

April 11-13.—Elkwood Park, Long Branch, N. J.—The Interstate Association's seventh annual Grand American Handicap tournament. Entries close April 4. Edward Banks, Sec'y, 318 Broadway.

April 18-20.—Lincoln, Neb.—The Lincoln Gun Club's second annual interstate tournament; targets and live birds; \$500 added. Geo. L. Carter, Sec'y.

April 18-21.—Baltimore, Md.—Prospect Park Shooting Association's tournament; \$500 added. Stanley Baker, Sec'y.

April 21-28.—Baltimore, Md.—Tournament of Baltimore Shooting Association; targets and live birds; money added. Geo. L. Harrison, Sec'y.

May 2-5.—Lincoln, Neb.—Nebraska State Sportsmen's Association's twenty-third annual tournament, under the auspices of the Capital City Gun Club; six amateur and four open events each day; targets and live birds. R. M. Welch, Sec'y.

May 9-13.—Peoria, Ill.—Illinois State Sportsmen's Association's tournament. C. F. Simmons, Sec'y.

May 16-19.—Erie, Pa.—Ninth annual tournament of the Pennsylvania State Sportsmen's Association, under the auspices of the Reed Hurst Gun Club. F. W. Bacon, Sec'y.

May 16-20.—St. Louis, Mo.—Tournament of the Missouri State Fish and Game Protective Association. H. B. Collins, Sec'y.

May 17-18.—Oil City, Pa.—Tournament of Interstate Association, under the auspices of the Oil City Gun Club. F. S. Bates, Sec'y.

May 23-25.—Algona, Ia.—Tournament of the Iowa State Association for the Protection of Fish and Game. John G. Smith, Pres.

May 24-25.—Greenwood, S. C.—Annual live-bird tournament of the Greenwood Gun Club; 25-bird Southern Handicap. R. G. McCants, Sec'y.

May 30.—Canajoharie, N. Y.—All-day target shoot at Canajoharie, N. Y. Charles Weeks, Sec'y.

May 30-June 2.—Erie, Pa.—Ninth annual tournament of the Pennsylvania State Sportsmen's Association, under the auspices of the Reed Hurst Gun Club. Frank W. Bacon, Sec'y.

June 5-10.—Buffalo, N. Y.—New York State shoot, under the auspices of the Buffalo Audubon Gun Club; \$1,000 guaranteed; over \$2,000 in merchandise, and \$1,000 added money in open events. Chas. Bamberg, Sec'y, 51 Edna Place.

June 6-9.—Sioux City, Ia.—Fifth annual amateur tournament of the Soo Gun Club. E. R. Chapman, Sec'y.

June 7-9.—Columbus, O.—Tournament of the Ohio Trap-Shooters' League, under the auspices of the Sherman Rod and Gun Club. J. C. Porterfield, Sec'y, O. T. S. L.

June 14-15.—Bellows Falls, Vt.—Tournament of the Interstate Association, under the auspices of the Bellows Falls Gun Club. C. H. Gibson, Sec'y.

June 14-16.—Cleveland, O.—Cleveland Target Co.'s tournament.

June 20-22.—Sistersville, W. Va.—Third annual tournament of

the West Virginia State Sportsmen's Association, under the auspices of the Wheeling Gun Club, Wheeling, W. Va. John B. Garden, Sec'y.

July 19-20.—Providence, R. I.—Tournament of the Interstate Association, under the auspices of the Providence Gun Club. R. C. Root, Sec'y.

Aug. 9-10.—Portland, Me.—Tournament of the Interstate Association, under the auspices of the Portland Gun Club. S. B. Adams, Sec'y.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have printed. Ties on all events are considered as divided unless otherwise reported. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York.

The Gun Bore Treatment Co., of 7 and 9 Warren street, New York, report most gratifying business support. Mr. Neaf Appar, the manager, informs us that the guns received during the present month for treatment were in large numbers. The company claims that their treatment is an absolutely effective and permanent protection against the rusting, pitting, fouling and leading of the bore, and that after they have treated a gun hundreds of charges can be shot out of it, and thereafter it can be put away uncleaned for months without damage to it, the treatment rendering it impervious to rust, dampness, powder gas and salt water. The company is pleased to receive visitors at its office and show sections of barrels treated and untreated, with all the benefits gained by the former.

In the programme of the Grand American Handicap, published elsewhere in these columns, there is one statement which we are convinced is incomplete as to qualifications. It reads as follows: "All birds will be retrieved by dogs, the dog being released the moment the bird touches the ground." Undoubtedly this meant after the shooter had fired his second shot or opened his gun. A bird might touch the ground after the first shot, and still need a second shot. Lies is a better word than touch, for a bird might touch the ground and then disappear where earth and sky meet.

Under date of Feb. 18, Messrs. Daly & Chanfran write us as follows: "We beg to state that on March 13 and 14 there will be two events shot at Elkwood Park: On the 13th, the Oakley handicap, named in honor of Miss Annie Oakley, 25 live birds, \$10 entrance, birds extra, handicaps from 25 to 33yds., high guns, Tuesday, 14th, the sportsman handicap, 25 to 33yds., 20 live birds, \$10 entrance birds included, high guns. Money in both events to be distributed according to number of entries. Miss Oakley will present cup to winner."

The all-day shoot of the Lyndhurst Shooting Association, of which the State championship, the E. C. cup being the emblem, takes place on Saturday of this week. There are ten events on the programme, eight at 15 targets, each \$1 entrance, and one at 25, \$1.50 entrance. Moneys divided by the Rose system. Grounds can be reached in thirty minutes from New York, either by the Erie R. R. to Lyndhurst, or D., L. & W. to Lyndhurst. T. W. Morfe, Sec'y.

Mr. E. G. Horton, 100 Railroad avenue, White Plains, New York, writes us as follows: "All the preparatory details of Westchester handicap, March 1, have been carefully considered and executed. We now await the day of contest, and trust that the elements will favor us with sunshine, and that our friends and shooting companions may have a pleasant journey to White Plains. Kindly remember, 9:15 A. M. train, New York & Harlem R. R."

The race for the championship of New Jersey, at Lyndhurst, on Saturday of this week should be very close. Harold Money has worked up, into excellent form. Last Saturday he missed but 6 targets out of 145 shot at—a gait which is a trifle short of 96 per cent. Mr. Morfe seems to be always in good form; therefore the race is one well worth witnessing.

At Waterloo, Neb., on Feb. 14, in a two-men team race for \$100, between Waterloo and Gretna, Messrs. Mayhew and Wilkins scored 14 and 17 respectively out of 25 live birds. Messrs. Harclon and Beaublett, the Gretna team, scored 23 and 22 respectively, thereby winning by a total score of 45 to 31.

Mr. J. R. Newall, of the U. S. Smokeless Powder Co., San Francisco, returned to California last week, after quite an extensive visit in the East, and we take pleasure in adding that he will return East again in time for the Grand American Handicap.

Mr. Chas. Lambert (Bryan), of Haverhill, Mass., was in New York during last week, and participated in the shoot of the Brooklyn Gun Club, on Thursday last. He made some excellent scores, considering that he was shooting with a strange gun.

The annual live-bird shoot for a Remington hammerless gun, 12-gauge, will be shot on the grounds of the West Chester Gun Club, at West Chester, Pa., on March 2. Tickets, \$1; miss-and-out. Birds 15 cents each. American Association rules.

A match at 50 live birds per man between Messrs. Justus von Lengerke, of New York, and L. Harrison, of Minneapolis, has been made, to take place some time in the future.

Mr. A. A. Hegeman won the Class A contest in the New Utrecht Club shoot, at Woodlawn, Feb. 11, killing 9 out of 10 at 28yds.

The two days' shoot at live birds at the Three-Mile House, Reading, Pa., will take place on Thursday and Friday of this week.

BERNARD WATERS.

Programme of the New York State Shoot.

THE forty-first annual convention of the New York State Association for the Protection of Fish and Game will be held at Buffalo, N. Y., June 5 to 10, 1899, inclusive, under the auspices of the Buffalo Audubon Club.

In connection with the New York State shoot, to be held at Buffalo, June 5 to 10, inclusive, the Buffalo Audubon Club has arranged the following programme, open to all sportsmen in the United States and Canada. Professional experts and manufacturers' agents will be allowed to shoot for price of birds only, but will be provided for by special prizes, over \$100 of which are specified herein.

Expert amateurs will be handicapped as follows: Every man shooting 90 per cent. or better will pay \$4 extra each day. Every man shooting 85 per cent. and less than 90 per cent. will pay \$2 extra each day. These amounts will be set aside for a special purse, to be divided pro rata among amateurs shooting through the first three days' programme, who fail to get one of the twenty special average prizes provided for in the programme.

The club will not attempt to classify the shooters or charge extra entrance fee, but will deduct amount from winnings each day, after day's average has been ascertained. By this method shooters classify themselves each day, and all objections to unfair handicap will be avoided.

First day, Tuesday, June 6: No. 1, 15 targets, \$25 added, entrance \$2; No. 2, 15 targets, \$25 added, entrance \$2; No. 3, 25 targets, \$500 guaranteed purse, surplus added, entrance \$5; No. 4, 20 targets, \$25 added, entrance \$2; No. 5, 20 targets, \$25 added, entrance \$2; No. 6, 15 targets, \$25 added, entrance \$2; No. 7, 15 targets, \$25 added, entrance \$2; No. 8, 20 targets, \$25 added, entrance \$2; No. 9, 20 targets, \$25 added, entrance \$2. Five moneys in 15 and 20-bird events; eight moneys in 25-bird events; \$50 added for (amateur) day's averages; ten high guns, \$5 each.

Second day, Wednesday, June 7: No. 1, 15 targets, \$25 added, entrance \$2; No. 2, 15 targets, \$25 added, entrance \$2; No. 3, 25 targets, grand merchandise, entrance \$5; No. 4, 20 targets, \$25 added, entrance \$2; No. 5, 20 targets, \$25 added, entrance \$1; No. 6, 15 targets, \$25 added, entrance \$2; No. 7, 20 targets, \$25 added, entrance \$2; No. 8, 20 targets, \$25 added, entrance \$2; No. 9, 20 targets, \$25 added, entrance \$2.

In event No. 3 (grand merchandise) the Buffalo Audubon Club will guarantee 100 merchandise prizes, every one of which will be worth at least the value of entrance money, \$5, and will also guarantee that the total value of prizes in this event will exceed \$1,000. Five moneys in 15 and 20-bird events; \$50 added for (amateur) day's averages; ten high guns, \$5 each.

Third day, Thursday, June 8: No. 1, 15 targets, \$25 added, entrance \$2; No. 2, 15 targets, \$25 added, entrance \$2; No. 3, 25 targets, \$500 guaranteed purse, surplus added, entrance \$5; No. 4, 20 targets, \$25 added, entrance \$2; No. 5, 20 targets, \$25 added, entrance \$2; No. 6, 15 targets, \$25 added, entrance \$2; No. 7, 15 targets, \$25 added, entrance \$2; No. 8, 20 targets, \$25 added, entrance \$2; No. 9, 20 targets, \$25 added, entrance \$2. Five moneys in 15

and 20-bird events; eight moneys in 25-bird events; \$50 added for (amateur) day's averages; ten high guns, \$5 each.

Fourth day, Friday, June 9: No. 1, 50 targets, \$50 added, entrance \$5; No. 2, Buffalo Audubon Club event, open handicap. Rich merchandise prizes to be announced hereafter, guaranteed to exceed in value \$1,000.

Clearing up of events of former days if any are unfinished. Sweepstake events. Targets at this tournament will be 2 cents each, and all entrance moneys include targets.

General Prizes.

To the twenty amateurs making best averages in all events of the first three days' programme will be given ten merchandise prizes of a guaranteed value of over \$10 each, and ten cash prizes of \$10 each. All amateurs shooting through the first three days' programme and not obtaining one of the above average prizes will divide pro rata the proceeds of the purse provided by taxes on those who shot 85 and 90 per cent. daily averages.

To the ten high guns among experts shooting through the first three days' programme the club will give \$10 each, and will also provide a special prize for first average. Other prizes for experts will be arranged for hereafter. See programme, ready about May 1.

Special prizes and events for New York State shooters will also be arranged for hereafter.

The purpose of arranging at this early date for open events is to give shooters from a distance a chance of deciding just where the best programme for the year is offered. This tournament, in connection with that to be held at Cleveland the following week, must surely offer the best inducements of the year. Among the merchandise prizes will be at least twenty transportation tickets to Cleveland and return. An additional notice will be issued in advance of the final programme.

Guarantees to Date in Open Events.

\$1,000 added money; \$1,000 guaranteed in two purses of \$500 each; \$2,000 merchandise; 2-cent targets; all averages added.

Rochester Rod and Gun Club.

ROCHESTER, N. Y.—The change in the weather called out an unusually large midwinter crowd to the ranges and traps of the Rochester Rod and Gun Club last week. The weather was as perfect for shooting as any day this winter. A number of shooters who had never tried it before went out to Cobb's Hill yesterday afternoon, and they did well. Sim Glover entered a couple of events, retiring with two good scores. The club is making a very successful effort to enlist the interest and enthusiasm of the members. There was a time when the members seemed to lose interest in the club, only a few of them—always the same ones—going out to Cobb's Hill every week.

There has been a great change for the better. Now the members flock to the club house by the scores. If next Wednesday proves as fine a day there will doubtless be a still larger attendance. Many of the members who would like to try live-bird shooting have been unable to find any birds. Frank McCord told the Democrat and Chronicle man last evening that person having birds to sell could notify him at his place of business, No. 113 State street. He will hereafter see to it that all members desirous of obtaining birds are supplied with them. There are several persons in and about Rochester who raise birds for this purpose.

Twenty-two members in all participated in the target events yesterday afternoon. Nugent, who had never before entered an event, made 8 out of a possible 10 in the first event. Daly, another new man, also made a creditable showing. The best shooting was done by Norton, Mosher, Parsons and Borst. The first three named entered seven events, each of 10 targets. Following are the scores:

Events:	1	2	3	4	5	6	7
Targets:	10	10	10	10	10	10	10
Norton	9	8	7	7	8	9	8
Weller	7	8	6	8	7	9	..
Fuller	6	7	5
Kerschner	5	7	5	..	7	5	..
Willard	7	5	4
Jones	7	8	7	7	7
Judson	6	4	6	4	6	5	..
Mosher	8	7	8	10	8	8	9
Parsons	8	6	9	9	6	7	6
Glover	9	10
Gibson	7	4	5	4	6
Borst	9	8	7	8	8	9	..
Daly	3	5	5	6	4
McChesney	6	6	6
Rogers	6	6	5
Kay	7	6	8	10
Galbraith	5	6	5	8	8
Myers	5
Nugent	8
McCord	8
Porter	4	6
Wray	7	6

Four of the best shooters in the club shot at live birds. They were Wray, Weller, Gibson and Myer. Wray made 12 out of a possible 15. Myer shot at 10 birds and only missed one. Weller missed 2 out of 10, and Gibson allowed 3 birds to pass. The score:

Live birds:	
Wray	201210221101212—12
Weller	2100122112 — 8
Gibson	0210021122 — 7
Meyer	2120121122 — 9

Frank McCord and Ed C. Meyer are going to shoot for the championship of the county. McCord is the crack shooter of the Columbia Rifle Club.

Though he has only been shooting at the Rod and Gun Club for a comparatively short time, he has rapidly risen to the "big circle." Meyer is a veteran shooter at Cobb's Hill. He is a good one too, and classes well up with Glover and the other stars.

The McCord-Meyer match will be put on the boards directly after Dr. Weller and Meyer finish their contest. The all-round championship of the county will consist of five events, two with the rifle at the Schuetzenzilde range at Cobb's Hill, two with the shotgun on the Rochester Rod and Gun Club's grounds, and one with the pistol at the Columbia Rifle Club's range in Reynolds arcade.

The shotgun events will be at 100 bluebirds and 25 live birds. The rifle events will be off-hand shooting, 10 shots at 200yds. and 10 shots at 25yds. The pistol event of 10 shots will be at 10yds. off-hand. It is probable that two days will be taken for the match, the shotgun events to be contested on one day and the rifle and pistol events on the other.

Trap around Reading.

READING, Pa., Feb. 11.—Mr. Harvey Clouser, of Gibraltar, Pa., has posted a forfeit of \$10 with Larry Ressler, 26 South Sixth street, this city, and challenges Coldren to shoot either American Association rules or Rhode Island rules, 50 or 100 live birds, for \$100 or \$200 a side. Mr. Clouser reserves the right to select the place for the match.

Feb. 7.—The Mt. Penn Gun Club, of this city, held a meeting and elected the following officers: President, Harry Saylor; Vice-President, Wm. Smith; Secretary, Geo. Rhoads; Treasurer, Albert Yeager; Captain, Harry Ball; Trustees: Messrs. Shultz, Laird, Gerhard, Strohecker and Brown.

Oakbrook, Pa., Feb. 6.—Mr. Chas. Echelman, of Gibraltar, and Chas. Hufford, of Oakbrook, shot a match at the Kurtz House, each man shooting at 25 live birds for \$10 a side. Echelman won, killing 22 to Hufford's 14. The conditions were 25 live birds per man, 28yds. rise, 50yds. boundary.

Phoenixville, Pa., Feb. 8.—J. Buckwalter defeated J. Edwards, both of this place, to-day in a live-bird match, by the score of 21 to 15.

Reading, Pa., Feb. 18.—The Reading Shooting Association had to postpone their live-bird match from Feb. 15-16 to Feb. 23-24, owing to the recent blizzard, which struck Reading last Monday and tied up all traffic on all roads. The same programme as announced a week ago in FOREST AND STREAM will be followed. Mr. Ritter, secretary, of the Reading Shooting Association, stated to the writer that among the entries in the Shillington handicap, 25 birds, \$15 entrance, handicaps from 26 to 33yds., guarantee \$200, were Elliott, Brewer and Welsh, and many other prominent shots from this section.

The Somerset handicap, to have been shot on Feb. 17, has been indefinitely postponed by the manager, Mr. Chas. Bechtel. Pottsville, Pa., Feb. 16.—A live-bird match was shot on the

Tumbling Run Dam grounds to-day between Ellis and Sterner on one side, and Cavanaugh and Allen on the other. The score: Sterner 4, Ellis 6; total 10. Cavanaugh 4, Allen 4; total 8.

Reading, Pa., Feb. 18.—The members of the South End Gun Club held a short practice shoot to-day, getting into condition for the next medal shoot, to be held Feb. 22. The medals are at present held by Shaaber, Downs and Ball. The medal shoot is a handicap, class shoot, each man shooting at 25 targets over the magautrap.

All arrangements are completed for the live-bird shoot of the Mt. Penn Gun Club, on Washington's Birthday, Feb. 22. Each man shoots at 15 live birds, 25 to 28yds. rise, 50yds. boundary, to decide the live-bird championship of the Mt. Penn Club. The event will be shot on the Mt. Penn grounds on Mt. Penn.

DUSTER.

WESTERN TRAPS.

Montgomery Ward Live-Bird Handicap—Second Series.

CHICAGO, Ill., Feb. 18.—The new series of the Montgomery Ward & Co. live-bird handicap started off yesterday afternoon at Watson's Park at a very hot pace, there being thirty-four entries, of whom fifteen were from outside of the county, this latter fact showing that the non-resident clause is bound to be a popular one. Waukegan sent down a good turnout. The afternoon passed very pleasantly indeed. The weather was mild, but a strong wind gave life to the birds and made the shooting far from easy.

There were nine men who landed in the 15 hole, and in the first tie there was not a straight. Sturtevant stood to win the tie and once apparently had it safely in his hands. He caught a fast blue driver, which he knocked down directly against the wire, but when the dog went to retrieve the bird the latter gathered and hopped over the boundary. Then followed an odd incident. There were four men below Mr. Sturtevant who had one bird each to shoot at, and one man who had two birds to shoot at. Any one of these men could have won the badge by killing, but one by one they missed, and the men had to go into the next tie. The final tie was shot miss-and-out. Nelson in the finals ran neck and neck with Col. Felton, but the Colonel missed his fifth bird, and Nelson killing, won the badge for the first contest of the series. Mr. Nelson is an old-time Audubon Club shooter, whose name has been too infrequent of late in the trap scores, but whom we may hope to hear from more frequently hereafter. The following are the scores:

George Roll, 30, 12; C. Flinn, 28, 14; W. B. Leffingwell, 30, 14; E. O. Rice, 26, 13; E. Sturtevant, 30, 15; N. L. Hoyt, 28, 15; C. E. Felton, 28, 15; T. B. Hoyt, 28, 15; R. G. Dwyer, 30, 11; J. S. Boa, 30, 14; W. B. Stannard, 28, 13; N. Nelson, 28, 15; A. L. Mottinger, 28, 15; F. G. Barnard, 28, 13; W. S. Bullock, 28, 10; E. P. De Wolf, 28, 13; J. B. Barto, 30, 12; R. Simonette, 28, 15; Edmonsens, 28, 0; J. Hoffman, 28, 15; J. L. White, 30, 13; T. P. Hicks, 30, 13; S. Palmer, 30, 11; N. Broadbier, 28, 8; M. H. Shaw, 28, 11; H. Lee, 26, 15; H. J. Sconce, 30, 14; H. Ehlers, 30, 13; C. C. Hyde, 30, 14; E. M. Steck, 30, 14; D. O'Brien, 28, 15; W. N. McCanney, 28, 5; V. A. Rosebeck, 28, 12; C. Hoffman, 28, 15.

C. A. A.

The live-bird medal of the Chicago Athletic Association was won Thursday afternoon by Mr. J. M. Sellers. The entry was small, but select, and the shooting no sinecure, a strong wind giving the birds legs. Mr. Sellers had a handicap of two birds, by means of which he landed straight. Score:

George A Thorne	2220*2012101222—11
J. M. Sellers, 2	212220211202221—15
H. H. Frothingham	221226212122222—14
J. E. Farrell, 3	221202111202200—14
O von Lengerke	222222220222222—14

Notes.

Audubon Gun Club medal was won this week at Watson's by J. A. Amberg, who sustained his reputation by landing in the 20 hole straight.

At the annual meeting of the Garden City Gun Club this week the following officers were elected: President, A. L. Smith; Vice-President, J. H. Amberg; Secretary and Treasurer, Henry Levi. Directors: Henry Ehlers, John Watson, A. L. Smith.

Trouble pends between Mike Petrie and John Amberg, who will at a date later set shoot at 50 live birds at Watson's Park.

Alpine Gun Club will hold a little team race, with an all Chicago team, at 25 birds, Watson's, Monday afternoon.

Mr. C. C. Hess, secretary of the Eureka Gun Club, sends the following announcement:

"Please announce in the next issue of FOREST AND STREAM that the annual meeting of Eureka Gun Club, of Chicago, will be held in Parlor L—38, Great Northern Hotel, Wednesday evening, Feb. 22, at 8 o'clock, for the election of officers for the coming year, and other business. All the members are requested to be present, as matters of vital importance pertaining to club affairs are to be discussed."

Garfield live-bird shoot to-day, at Watson's. Scores elsewhere. E. HOUGH.

1200 BOYCE BUILDING, Chicago, Ill.

ON LONG ISLAND.

Brooklyn Gun Club.

Brooklyn, L. I., Feb. 18.—The weather was very unfavorable. Soon after the shoot began rain set in. There was a fair attendance nevertheless. The feature of the contest was Harold Money's good shooting. He made straight scores in several events. The club shoot was shot in the rain, which caused several to refrain from entering, and Mr. Banks withdrew on that account at the end of the first 25. Among the visitors was the popular shooter, Mr. Chas. Lambert (Bryan), of Haverhill, Mass. He shot with admirable skill, considering that he was using a strange gun.

The scores of the club shoot are as follows:

Banks	100101101111111111111111—20
Waters	1111101011101101011101—18
Douglas	01111111111010001111101—19
Billings	111111010110010111110101—18
II Money	0111111101011111111111—22
Bryan	1111111111111111111111—25

Interstate Tournaments.

PITTSBURG, Pa., Feb. 18.—Editor Forest and Stream: The Interstate Association has made arrangements to give inanimate target tournaments during the season of 1899 as follows: Oil City, Pa., May 17 and 18; Bellows Falls, Vt., June 14 and 15; Providence, R. I., July 19 and 20; Portland, Me., Aug. 9 and 10. This completes the circuit, with the exception of a tournament during the month of September, negotiations for which are now pending.

ELMER E. SHANER, Manager.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iv.

All contestants will shoot their score at the same target.

BIRDS EXTRA.

Birds will be extra in all events. When entering for any event the shooter must pay for all birds called for in that event, in addition to the entrance fee. Money will be refunded for all birds not shot at on application to the compiler of scores, who will furnish rebate tickets that will be redeemed for cash at the cashier's office.

INFORMATION RELATING TO THE GRAND AMERICAN HANDICAP EXCLUSIVELY.

The manner of shooting the Grand American Handicap this year (and, in fact, all events scheduled for the tournament) is as follows: Shooters will be called to the score in turn, shooting their first bird at No. 1 set of traps; as soon as a shooter has shot at his first bird, he passes on to No. 2 set and shoots at his second bird on that set; he then shoots at another bird on No. 3 set and passes into the building through the right wing, waiting until it is time for him to go out and shoot at his fourth, fifth and sixth birds, and so on.

A contestant missing five birds must drop out, with the privilege of re-entering in case he has a chance to win any portion of the purse.

To facilitate shooting, and to prevent delays at Nos. 2 and 3 sets of traps, a shooter who happens to score his fifth miss on either No. 1 or No. 2 set of traps must finish that round of three birds, irrespective of the fact of his having five misses to his credit.

Every shooter will be numbered, each entry being known by his number when called to the score. A small tag will be affixed to each shooter's back, giving his number on the shooting list, and also his handicap in yards. This will enable the referee to see at a glance if the shooter is at his right mark; and will also enable shooters, spectators and scorers to tell who is at the score by merely referring to the list of entries numbered in shooting order.

Each contestant must supply himself with five "no bird" tickets.

In case the Grand American Handicap entries are so numerous that it is impossible to finish in good light on April 12, the referees shall stop the shooting at any time they may deem it necessary; in this case the shooting will commence at 9 o'clock sharp, Thursday, April 13.

Positively no entry will be taken, nor shooting up allowed, after the last man has shot at his second bird.

The Interstate Association reserves the right to refuse any entry.

An admission fee of 50 cents will be charged each day.

All contestants in the Grand American Handicap will receive a badge, which will admit them to the Park free during the entire tournament.

Any shooter who is not a contestant in the Grand American Handicap will have the 50 cents paid for admission refunded (at the cashier's office) upon his making entry in any sweepstakes event.

The comfort and convenience of the contestants, as well as the spectators, has been looked after carefully, inasmuch as the entire club house is closed in with glass front and heated throughout. The two wings, located within a few yards of the traps, will be reserved for the exclusive use of the shooters, where they can witness the sport when not actively engaged in it.

The office of Compiler of Scores will again be filled by Mr. Edward Banks. His services the last three seasons in a similar capacity are a sufficient guarantee of excellent results on this occasion. Mr. Banks, also, will act as press representative.

Conveyances will meet trains at the Elkwood Park stopping place and carry shooters to the club house, charging 10 cents. Shooters are requested to inquire what the fare will be before riding in the conveyances. This is necessary to avoid being imposed upon by unprincipled parties.

A warm and substantial lunch will be served each day in the club house for the sum of 50 cents.

Shooters desiring meals a la carte can secure same at Elkwood Inn.

Contestants are requested to make sure that their guns are not over 8lbs. in weight, as all guns will be weighed at the score.

An official record will be made of the make of gun, kind of powder, shot and shell used by each contestant. This record will be compiled by an official appointed for the purpose, and contestants will be required to furnish such information as is necessary.

The association reserves the right to select two cartridges from each contestant (to test the same for proper loading), the selection to be made, at any time, from those of a shooter at the score.

Bank checks, drafts or bills of exchange will not be received at the cashier's office in payment for balance due on entries, nor will any check, draft or bill of exchange be cashed during the tournament. This rule will be strictly enforced.

The locker arrangement will be entirely different from that of former years. A new office has been created—Locker Office—the duties of the official in charge being somewhat similar to that of a hotel clerk.

Lockers will be rented to those who desire them at the rate of 50 cents per man for the week's shooting, three contestants to each locker. These lockers are amply sufficient to accommodate the belongings of three shooters, and no two lockers have the same key, there being seventy-five lockers all told. Each applicant will be required to deposit \$1, of which amount 50 cents will be refunded on return of the key check when through with the locker.

Any three contestants who desire to be assigned the same locker can have one reserved for them in advance by making application to the Manager, Elmer E. Shaner, 122 Diamond Market, Pittsburg, Pa.

It is requested that entries for the Grand American Handicap be made in ample time to permit the sending of receipt and admission badge, and for same to reach the maker of the entry prior to his departure for Elkwood Park. Should entries be received so late that it will be impossible to reach the maker of the entry, by mail, until after Saturday, April 8, receipt and admission badge will not be sent. Therefore, shooters who make late entry, and do not receive receipt and admission badge, will be required to pay 50 cents admission to Elkwood Park, which will be refunded on calling at the cashier's office and applying for receipt, admission badge and rebate ticket covering the amount paid at the gate.

All entries made must be accompanied by the maker's full name and address, which will be withheld from publication if desired, and "shooting name" only will be used.

Guns, ammunition, etc., forwarded by express should be prepaid, and sent care of Daly & Chanfrau, Elkwood Park, Long Branch, N. J.

All consignments forwarded via the Adams Express Co. will be delivered at Elkwood Park without an extra charge from Long Branch.

For the convenience of shooters who desire to return goods by express, the Adams Express Co. will open a branch office at Elkwood Park on April 13, 14 and 15.

When making an entry by mail, remittances covering amount of forfeit (\$10) should be made by bank check, draft, post-office money order, express money order or registered letter.

Regular entries close April 4, and will be received at the New York office, Edward Banks, Secretary-Treasurer, 313 Broadway, New York, N. Y.

Special Announcement.

At a meeting of the Interstate Association, held at Madison Square Garden, Jan. 17, 1899, the following resolution was introduced:

"That all paid representatives, whether paid in shells, guns, money, or otherwise, and all those connected in any way with companies manufacturing guns, shot, shells, powder, targets and traps shall be barred from participating in sweepstakes and purses, but will be perfectly welcome to shoot for targets only and display their goods. The decision as to who such paid men are to be left at all times to the manager, whose decision shall be final.

"Resolved, That the foregoing does not apply in any way to the Grand American Handicap tournament."

Address all communications relating to inanimate target tournaments to the manager's home address, Elmer E. Shaner, 122 Diamond Market, Pittsburg, Pa.

Headquarters for sportsmen who desire to stop in New York will be the Astor House, Broadway, Barclay and Vesey streets.

The shoot of the Pawling Gun Club, which was to be held on Feb. 13, is postponed to March 25, which is also the first club shoot of the season of 1899. The same programme is offered, and in addition the Pawling Rod and Gun Club cash handicap; open to all; twenty-five targets; 50 cents entrance; high man to win. Handicaps arranged before the event is shot, but not announced until afterward. Ties shot off at twenty-five targets, same handicap.

Sportsmen's Association Tournament Programme.

The programme of the inanimate target tournament, to be given in connection with the Sportsmen's Show, under the auspices of the National Sportsmen's Association, in Madison Square Garden, New York City, March 2 to 15, 1899 (Sundays excepted), is now ready for distribution. J. A. H. Dressel, Secretary-Treasurer and General Manager, 280 Broadway, N. Y. The members of the committee are Messrs. Elmer E. Shaner, chairman; Edward Banks, secretary; Wm. M. (U. M. C.) Thomas and Bernard Waters.

Special Notice.—For \$2 any gentleman may become a member of the National Sportsmen's Association, membership entitling him to free admission to the Sportsmen's Show. Membership card is a season ticket. Address Sportsmen's Association, 280 Broadway, N. Y.

The management of the National Sportsmen's Association, in deciding to hold an inanimate target tournament in connection with its Annual Sportsmen's Show, March 2 to 15, 1899, hit upon something entirely new and startling in the line of attractions. When first suggested, the scheme did not seem at all practical, but later developments have proved the feasibility of the plan.

Madison Square Garden is covered with an ample roof-tree, and on that roof-tree the tournament will be held on the dates above mentioned. There is ample room for a single set of traps, arranged in the regulation manner, and throwing a good target, fully up to the requirements as laid down in the rules governing target shooting.

All competitions decided at this tournament will be under the direction of Mr. Elmer E. Shaner, whose well-known ability in the management of tournaments is a guarantee that the several competitions arranged for the occasion will be well, smoothly and successfully carried out. Mr. Shaner will be assisted by a corps of aides, who have been specially selected by him for their fitness to help in such matters.

The hours of shooting will be from 11 A. M. to 5 P. M. on each day during the two weeks that the Sportsmen's Show is open to the public, Sundays excepted. The six hours per day during which the traps are open for competitions have been divided by the management into three equal portions of two hours, each of these portions being set apart for the decision of some particular feature on the programme.

The Continuous Match, 11 A. M. to 1 P. M. each day.—This match is a new departure in the annals of trap-shooting. In this event re-entries are unlimited, four prizes being donated by the National Sportsmen's Association to the four men making the four longest runs of consecutive breaks made in this competition. No man can win more than one of the above four prizes.

All targets thrown at unknown angles.

No run of consecutive breaks made in any other competition will be allowed to count for prizes in the Continuous Match.

In addition to the above four prizes, the management will donate each day a prize to the shooter making the longest run of consecutive breaks on that day in this competition.

Entrance fee, 50 cents, in addition to cost of targets at 1½ cents each.

Re-entries unlimited.

Sportsmen's Association Championship, 1 P. M. to 3 P. M. Each Day.—Conditions, 100 targets, unknown angles, entrance 50 cents, in addition to cost of targets at 1½ cents each. Re-entries unlimited.

From Thursday, March 2, until Tuesday, March 14, inclusive, the traps will be open from 1 to 3 P. M. for shooters to qualify for the final round in the Championship Contest, which will take place on Wednesday, March 15. The conditions of the final round will be 100 targets per man, unknown angles, entrance price of targets at 1½ cents each.

Those eligible to compete in the final round of the Championship Contest will be the twenty-five shooters having the twenty-five highest totals made in the previous "qualifying rounds" shot on any of the preceding days of the tournament.

No shooter can qualify with more than one score, that score being the highest made by him in the "qualifying rounds."

As re-entries for the qualifying rounds are unlimited, any shooter can, during the qualifying rounds, try to better any record made by him in previous rounds.

Prizes.—To the winner in the final round of the Championship Contest will be donated a handsome trophy, emblematic of the Sportsmen's Association Championship. This trophy will become the property of the winner.

To the shooter making the second highest score in the Championship Contest will be donated a gold medal.

To the shooter making the third highest score in the Championship Contest will be donated a silver medal.

To the shooter making the fourth highest score in the Championship Contest will be donated a bronze medal.

In addition to the above prizes, the management will donate a prize each day to the shooter making the highest score in the qualifying rounds shot on that day.

Sweepstakes and Special Matches, 3 to 5 P. M. Each Day.—From 3 to 5 P. M. each day the traps will be open for sweepstake shooting, special matches, or for competitions for special prizes as may be decided upon by the management.

No programme will be definitely arranged for this portion of the tournament, but the programme for the following day will be posted up the previous afternoon on the bulletin board devoted specially to announcements in connection with this tournament.

Intending contestants can ship guns and shells in care of Mr. James C. Young, Madison Square Garden, New York City.

Boston Gun Club.

WELLINGTON, Mass., Feb. 17.—The execrable weather of Wednesday, Feb. 8, rendered shooting quite out of the question, so the Boston Gun Club was forced to submit, and the eighth prize shoot passed without a single score being entered in the prize match. The following Wednesday, Feb. 15, afforded another example of the weather's vagaries, for the terrible storm of Monday had left its mark at Wellington, as in other places, and the trapping of targets was accomplished under difficulties. Shooting also, if we may judge by the scores, for with two exceptions they were decidedly off. The irregularities of traps and pulls hardly seemed to affect Mr. Gordon, who emerged from the afternoon's trials and tribulations with a clean 80 per cent. Likewise Mr. Woodruff, who had scarcely less. Such records but serve to emphasize the downfall of others who allow minor details to worry and perplex when they should be attending strictly to business. Scores complete:

Events:	1	2	3	4	5	6	7	8	9	10	11
Targets:	10	10	3p	10	10	5	3p	10	10	10	10
Gordon, 17	10	7	3	9	9	4	2	9	8	8	9

Miskay	0	11	11	11	11	11	11	11	11	11	11

The Warwick Gun Club will hold a Washington's Birthday shoot on Feb. 22. There are eight events, calling for 125 targets, with a total entrance fee of \$5.75. Extra events to suit the wishes of visitors if time permits. Targets are included in all events. Lunch and coffee on the grounds. The shoot takes place rain or shine, blizzard or calm. There will be two individual races also. One for the E. C. cup, 100 targets, between W. S. Lines, the holder, and A. W. Edsall, challenger. The other for the president's cup, 100 targets, between J. M. Servin, holder, and T. Welling, challenger. Shooters are cordially invited. John B. Rogers, Manager, Warwick, N. Y.

IN NEW JERSEY.

Belvidere Gun Club.

Belvidere, N. J., Feb. 11.—At the live-bird shoot of the Belvidere Gun Club, in the event at 10 live birds, 28yds. rise, 60yds. boundary, \$2 entrance, G. Bordeman killed 9 straight:

G Bordeman222112222-9	G McMurtrie10111200-5

Answers to Correspondents.

No notice taken of anonymous communications.

Princeton, N. J.—What model and what caliber of Colt's revolver is most in use among Western men? Also what length of barrel? Ans. The large model, .44 and .45, single action mostly, although there is now a limited fancy for smaller models of .38 to .45, which can be carried in the pocket.

R. H. A., Alberta, N. W. T.—1. The breeders of barzois presumably breed for their own private use, as they are modest advertisers. We regret that we cannot furnish the information. 2. According to the Massachusetts Rifle Association's rules, the standard American target, full size, having an 8in. bullseye, is used at 50yds.; the same, half-size—that is, 4in. bullseye—at 30yds.; one-quarter size—2in. bullseye—at 20yds.; and in the same ratio of reduction at lesser ranges.

PUBLISHERS' DEPARTMENT.

A Defense of Militarism.

BY A PROMINENT GERMAN AUTHORITY.

Prof. Gustav F. Jaeger, whose name has become familiar to the civilized world by his "woolen-wear theory," recently delivered a public lecture at Stuttgart on the results and benefits of militarism. In his opinion Germany's army system, in its growing scientific development, is the principal basis of her immense economic evolution and expansion. Through the nation's military education the health of the people has been steadily improving, thus creating a "live capital" that cannot commensurately be acquired or represented by mere accumulation of dead coin. * * *

As to the sanitary effects of militarism he proves his theory by statistics drawn from the health reports of the German army. During the three years' service in the army, which is recruited from the whole of the people without distinction, the third year's soldiers presented the most favorable conditions of health and efficiency, not only in the active service, but also as forming the best physical and mental preparation for civil life, enterprise and success, a result not attainable, or at least never yet produced by any other system of education in public schools or academies of learning. A militarily trained person is endowed with a physical and mental equipment far superior to that of the "State school cripple," whose brain is battered by indigestible book learning, and whose nerves are neutralized by the unhealthy atmosphere of the recitation room and the senseless system of an education which forgets the old rule that we ought to "learn for life, not for the school." In the annual maneuvers of German reserve and national guard forces Dr. Jaeger discovers a national health factor that no sanitary regulations, public or private, are able to produce. German military training alone supplies a nation with the necessary living capital for future growth.—Baltimore Sun, Jan. 31, 1899.

Old Point Comfort, Richmond and Washington.

NEXT SIX-DAY TOUR VIA PENNSYLVANIA RAILROAD.

THE second of the present series of personally conducted tours to Old Point Comfort, Richmond and Washington via the Pennsylvania Railroad will leave New York and Philadelphia on Saturday, Feb. 25.

Tickets, including transportation, meals en route in both directions, transfers of passengers and baggage, hotel accommodations at Old Point Comfort, Richmond and Washington, and carriage ride about Richmond—in fact, every necessary expense for a period of six days—will be sold at rate of \$34 from New York, Brooklyn and Newark; \$32.50 from Trenton; \$31 from Philadelphia, and proportionate rates from other stations.

OLD POINT COMFORT ONLY.

Tickets to Old Point Comfort only, including luncheon on going trip, one and three-fourths days' board at that place, and good to return direct by regular trains within six days, will be sold in connection with this tour at rate of \$15 from New York; \$13.50 from Trenton; \$12.50 from Philadelphia, and proportionate rates from other points.

For itineraries and full information apply to Ticket Agents; Tourist Agent, 1196 Broadway, New York; 759 Broad street, Newark, N. J.; or Geo. W. Boyd, Assistant General Passenger Agent, Broad Street Station, Philadelphia.—Adv.

Waterproof Hunting Boots.

THE waterproof boots and shoes made by Messrs. M. A. Smith & Co., of 25-25 N. Thirteenth street, Philadelphia, have won a high reputation among practical field sportsmen and anglers, because of their good qualities and experience-proved serviceability. Some people have a notion that the more hardships they go through in the field the more good they get out of it; and again others, wiser in their day and generation, wear the Smith Ideal shoes and go dry shod.

Postal Information.

THERE is a Coatesville in Indiana, Shirtsville in Pennsylvania, Hattville in Ontario, Shoe Cove in Newfoundland, Stockington in New Jersey, Yellowbreeches in Pennsylvania.

MORE people are binding their FOREST AND STREAMS than ever before. Are you binding yours? See advertisement of 40-cent binders. It's astonishing what a library FOREST AND STREAM files make up.

The Forest and Stream Publishing Co. are the largest publishers and importers in America of Books on Outdoor Sports. Their illustrated descriptive catalogue will be sent free on request.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

COPYRIGHT, 1899, BY FOREST AND STREAM PUBLISHING CO.

TERMS, \$4 A YEAR. 10 CTS. A COPY. }
SIX MONTHS, \$2. }

NEW YORK, SATURDAY, MARCH 4, 1899.

VOL. LIII.—No. 9.
{ No. 846 BROADWAY, NEW YORK. }

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iv.

A wise Philosopher, noting the sundry desires of divers men, writeth, that if an Oxe bee put into a Medowe hee will seeke to fill his Bellie with Grasse, if a Storke bee cast in shee will seeke for Snakes, if you turne in a Hounde hee will seeke to start an Hare.
HAKLUYT.

THE RUNNING DEER TARGET.

AMONG the devices of the modern rifle range is a moving target, known as the running deer, a sheet of metal so shaped as to present the broadside of a deer, and moved across the range by an arrangement of wires and pulleys in such way as to simulate the motion of the running game. Shooting matches at the running deer target are favorite forms of competition in Switzerland. An account of a typical meeting of this character in the Tyrol was printed in our columns a year or two ago. We have spoken of the moving target as a contrivance in modern use; but it is by no means modern in origin; it goes back to the early dawn of history, to an age prior to written history indeed, when the feats of mighty marksmen were perpetuated in song and legend and so handed down from generation to generation. For the flying target is mentioned in the Maha-bharata, one of the great epics of ancient India, and celebrating the exploits of heroes who contended at the butts in the fourteenth century B. C.

On the banks of the Ganges, the Maha-bharata tells us, thirty-three centuries ago, the monarch Dhrita-rashtra, King of the Kurus, gave what would in our day be known as an invitation champion shoot; that is, it was a tournament to determine who should have the name of amateur champion of the Kuru land, but only the one hundred sons and the five nephews of the monarch were invited to enter the competition for the distinction. So they measured out the tourney ground on a meadow clear of jungle, with a crystal fountain playing hard by, and built the altar for the sacred gifts, and erected the grandstand white and stately;

And the people built their stages circling round the listed green,
And the nobles with their white tents graced the fair and festive scene.

Then to the shooting ground repaired the spectators, men from stall and loom and anvil, Brahmans and priests, old and young, high and low, fair Gandhari the Queen, white robed Drona the priest and prophet, and the monarch himself, sightless, to whom was described the progress of the contest as it was fought. Then came the competitors, who, we are to understand, then, just as now, paid each his entrance fee, got his number in the squad, stepped to the score in his turn, twisted himself into his characteristic posture and called "Pull" when ready.

Each behind his elder stepping, good Yudhisthir first of all,
Each his wondrous skill displaying, held the silent crowds in thrall.

And that there were in those distant times, as well as in these later days of Wild West shows, marksmen who could ride and shoot, the epic further attests:

Mounted on their rapid coursers oft the princes proved their aim,
Racing, hit the targe with arrows lettered with their royal name.

The crack shot of those invited to the tournament was the King's nephew Arjun, who, as he stepped forth gauntled and jewel-girdled, and clad in golden mail, with carriage proud and stately, and bearing his mighty bow, created a sensation on grandstand and bleachers, so that a great shout went up from the people as they beheld him, and well it might.

Now the voices of the people died away and all was still,
Arjun to his proud preceptor showed his might and matchless skill,
Towering high or lowly bending, on the turf or on his car,
With his bow and glist'ning arrows Arjun waged the mimic war;
Targets on the wide arena, mighty tough or wondrous small,
With his arrows, bright, unfailing, Arjun pierced them one and all!
Cow-horn by a thread suspended, and by wings unceasing swayed,
One and twenty well-aimed arrows on this moving mark he laid.
Wild-boar shaped of solid iron coursed the wide-extending field,
In its jaws five glist'ning arrows sent the archer wondrous-skilled.

Here we have the moving target, the coursing boar

prototype of the running deer. And here we have the marksman who could hold on it as it coursed. Nor was he the only one; for then came Karna, uninvited to this championship shoot, an intruder, an interloper, an unknown, a dark horse; and this was the "bluff" he made:

"All thy feats of weapons, Arjun, done with vain and needless boast,
These and greater I accomplish—witness be this mighty host!"
Thus spake proud and peerless Karna, in his accents deep and loud,
And as moved by sudden impulse, leaped in joy the list'ning crowd.

Moreover, he could shoot as well as talk—

Drona gave the word, and Karna, Protha's war-beloving son,
With his sword and with his arrows did the feats by Arjun done!

This was of course bitter chagrin for the golden-mailed Arjun; for then, as sometimes even now, the worsted champion took defeat with ill grace. There were jealousies and heart burnings, a war of words followed, and then real war. Out of that shooting match on the Ganges grew a conflict of tribes and peoples so fierce and so stubborn, and waged so long that the chronicles which record it, as the epic has come down to us, growing with the centuries as shooting stories are apt to grow, extends to not less than 180,000 lines of verse—more, perhaps, than the entire product of spring poetry in this year of grace 1899.

So much of the antiquity of the moving target, and of the mighty men of old whose skill delighted to master it. Little did those contestants in the invitation championship shoot on the Ganges dream that they were shooting for a meed of enduring fame to be sung through the ages. And as for the marksman of to-day, wearer of the medals of the moment, holder of the cup of the hour, the moral for him is that the art of shooting did not come first into this world when he took to practice; there were champions of old, whose record, emblazoned on the records of thirty-three centuries, he well may emulate.

OLD TIMES ON THE PLAINS.

THE scene represented in our supplement this week tells a story of the past. It is nearly twenty years since the buffalo ceased to be the support of the red people of the Northwest. Before that time they had already been exterminated over the middle plains from northern Nebraska south to the northern line of Texas; but in Montana they were still found, as they always had been, crowded together in great herds, and people still said that the buffalo would never be all killed off. Traders and travelers over the Northern plains still spoke of them as found here or there by millions; and yet four years later there were none. If the vanishing of these great multitudes came with a shock of surprise to the white hunter, how much more amazing must it have been to the Indian who had always regarded these dusky hordes as his own property, on which he could forever draw for food, for shelter and for clothing. To him it was simply incredible that the buffalo should have disappeared, and for years afterward he would not believe that they had done so except by some supernatural means.

But Mr. Deming's picture is of the old days—the buffalo days—and it represents a scene familiar to those who knew the Primitive American Hunter and had part in the hunts of the people. In a wide valley, not far from the mountains, a herd of buffalo was feeding. The night before it had been discovered by the keen-eyed scouts, who had brought the news to the camp, and the chiefs had ordered the old crier to announce through the village that the next morning the people would go out and kill food. All were warned to bring in their horses; the men must whet their arrow points, the women must sharpen their knives. Very early in the morning the camp started; first the men, and then the women with pack animals and travois to bring in the meat. Under strictest discipline the force of hunters moved forward until they reached the point from which the charge was to be made, and then, at the word, swept down on the unsuspecting animals before them. Confused, surrounded, turned back, most of these soon fell before the keen arrows propelled from the powerful sinew-backed bow, until many brown carcasses lay upon the prairie. Then, as the men dismounted and let their horses go and began to skin the game, the women and children, with the pack animals, appeared over the swell of the prairie and hurried down to assist in the work, to butcher, to cut up the meat, pack it on the animals and transport to the camp.

He who took part in such scenes still sees in memory the parched yellow plain quivering in the hot air, the distant mountains, their sides dark with pines, and their peaks white with snow; the little groups of men and women and children and dogs and horses clustered about the brown spots on the prairie, which near were big and buffalo, and far off were mere dots surrounded by pigmies. And when the work had been completed, and the laden animals started to return to the camp he calls to mind the universal gladness that pervaded every individual of the motley throng. The babies could not cry, for they were busy sucking pieces of the meat, the older children were stuffed almost to stupor, while the women and the men knew that for a time at least the camp would be free from the fear of starvation. It was pleasant to take part in such a hunt, and not less pleasant at night, after the day was over, to sit in your lodge and listen to the cheerful sounds that rose from the camp.

SNAP SHOTS.

Mr. Charles Hallock calls our attention to an interesting personal item in the Calais, Me., Times, recording that "George A. Boardman, Esq., celebrated his eighty-first birthday at his home, on Lafayette street, Sunday, Feb. 5. Callers tendered their most hearty congratulations, and all expressed the wish that they might call upon him next year and find him enjoying good health and his usual cheerfulness."

That which gives point to the paragraph is the fact, noted by Mr. Hallock, that Mr. Boardman's was the second name on the list of subscribers among the patrons of FOREST AND STREAM when it was begun in August of 1873. The first subscriber was Gov. Horatio Seymour; and Mr. Boardman therefore enjoys the unique distinction of being the Nestor of FOREST AND STREAM readers; and he may defend his claim to the record even against those correspondents who occasionally aver—either through lapse of memory or by fisherman's license—that they have been reading the paper for thirty or forty years. Mr. Boardman has been a frequent contributor to our columns; we print to-day some notes from his pen on the queer ways of bears.

The worthless dogs infesting many sections of the South are a devouring curse, which costs the community hundreds of thousands of dollars annually. An endeavor was made in the Georgia Legislature the other day to levy a dog tax of one dollar, to apply throughout the State at large, and Mr. Dews, of Randolph county, the promoter of the measure, asserted that such a tax would exterminate thousands of worthless curs and put \$100,000 into the State treasury. It was a wise economic measure, but the Legislature, each member mindful of his own cur-infested district, lacked the moral courage to approve the measure, and it was defeated. Georgia will continue to breed dogs when she might breed sheep.

The New York Metropolitan Museum of Art has recently received, as an addition to its collection of arms, a handsome specimen of the old Purdy muzzle-loading shotgun, the gift of a sportsman of this city. As a work of art, the weapon is in every way worthy of a place among the Museum's treasures, and it would be a happy supplementing of the gift if owners of other guns deserving of such a disposition should follow the example of the giver of the Purdy and add to the collection of arms here preserved.

To one not versed in parliamentary practice, the outlook for the combination Hoar and Lacey bird bill in Congress is somewhat obscure. A report of the progress of the measure is given in our shooting columns. In Mr. Irland's letter is one paragraph which records a great victory for the cause of game protection in this country. The Washington market, so long open for the traffic in the game of the several States out of close season, has now been by act of Congress shut up.

That paper on Massachusetts trout hatcheries, written by Mr. C. C. Wood, a practical trout culturist of Cape Cod, read before the Massachusetts Association the other evening, and printed in our fishing columns to-day, ought to mark the beginning of a new era in the Commonwealth's fish-cultural administration. The logic of experience and of the facts related in the paper cannot be overcome.

The Sportsman Tourist.

Seven Sportsmen, Seven Springs, Seven Hundred Dollars, Seven Quail.

WE met at the Old Dominion Line dock, in New York city. When the good ship Roanoke glided out into the stream at 3 P. M. we had started for the North Carolina quail shambles. We shambled home later after having butchered seven quail all told. The trip cost the writer approximately \$100 of borrowed money, and unquestionably cost the others the same. Yet we were a happy lot. As the boat started our literary one-seventh quoted, "She starts, she moves, she seems to feel the thrill of life along her keel." Then arose a discussion as to the origin of the words. The one-seventh claimed that Longfellow's "Launching of the Ship" was a plagiarism; claimed that the words were first used when the girl slipped up in her first attempt to skate. That point settled, each began to tell the others what he thought he knew about ships that the others did not. A seventh son of a seventh son could not be more profound than each thought himself. On general principles it is best not to call names, yet I cannot resist the desire to state that the genial vice-president of the Old Dominion Line, W. A. Guillaudeau, was one of the party. I regret to state, however, that he did not shoot a thing; that he broke the stock of his gun and got angry at a purp. He deserved better luck. Let him know when you go South on his line and you will own the boat.

In due time what is called supper in Boston, dinner in New York, was available, and an appetite that reached from Cape May to New York was speedily satisfied by direct contact with an excellent cuisine. After supper we gathered on deck and talked about guns. One brought out a Lancaster, another a Greener, another spoke up for the Parker, while I exploited a Daly. The rest said that any old gun would do. I trotted out a Scott, 8-bore, under lever, 13½lbs., 36in. barrel, the finest thing that my gundealers ever charged. W. A. said, "What in the mischief did you bring that for?" "For quail," I told him. "You will blow a whole county out of the State," said he. Then I told them that I had 78lbs. of shells for it, and they were down in the hold for ballast; also that I had a revolver and bowie knife, fishing rod, three coats, two pairs boots, a lot of other duffel and a quart of Antediluvian. Toward the last they admired my judgment. 'Tis a good idea to carry all you have. It is fun to lug two guns, 100lbs. of shells and a lot of clothing around on a hot day. Another thing, the countrymen think that you are well fixed.

The ocean was as still as a mill pond. The moon—oh, never mind, I am growing old. We turned in about 12 P. M., turned out at 6 A. M. The first thing I saw in the morning was the name of Adam Phool on the clean white paint of the stateroom. He had registered all right, pedigree and everything. There is taste in all things; some show the most away from home. The mill pond had been dropped behind and we were "rocked in the cradle of the deep." We came out on deck and walked around sideways with our backs against the deck housing, with our feet apart and well to starboard. Some of the crew were heaving lead, some of the passengers their breakfast. The latter is a case of the weaker being the stronger. W. A. was gathering all stray newspapers and magazines. Upon inquiry I found that it was his intention to throw them out as we passed Cape Charles, in order that the lighthouse keepers might enjoy the reading matter. A signal from the steamer's whistle caused a boat with two occupants to put out from the lighthouse. They obtained the literature, and W. A. was happy. At times we saw stray ducks, and they became more numerous as we approached the bay. The gulls followed the boat in tandem to pick up what the cooks discarded. My field cannon was on deck, and the skipper made a splendid shot at a flying mallard, which was also gathered in by the lighthouse keeper.

We made a landing at Old Point Comfort and Norfolk, and then passed over to Pinnar's Point, where we took the cars. There were many colored men around and they seemed to be a cheerful and well-disposed lot. It is after they have hung around a Park Row beanery a year or two when they travel with an alias and with a pocket full of razors and talk "Come 7, come 11," that one does not care to affiliate with them. You can pick up as much quaint humor down South as among the lakes of Killarney. The cars and the afternoon sped away, and darkness came on. I was wrapped up in my thoughts and three coats, and shading my eyes against the window I watched the negro cabin lights as we passed through the country. The cabins were all alike—just a door in the front center, a stone chimney outside at one end, with a fireplace inside. The rattle of the cars called the occupants to the doors, and the light from the fire of pine knots flickered through the pickaninies' legs, while the tall forms of the parents were in silhouette. The children seemed to wear but little covering—possibly a fig leaf—I could not tell, the train went fast and the light was dim.

Late in the evening we arrived at the depot at Kingston, N. C. Our advance agent had done his work well, inasmuch as every public conveyance in town was there to meet us, and the populace was on the street eager to see the circus when it touched the town. After supper and a discussion as to the advisability of frying all kinds of food, we retired to dream the dreams of the innocent and virtuous.

In the morning all the shooters in town (both gun and crap) had assembled to cheer us on. Each of the former proffered us advice and something in the way of a dog. We compromised by taking one. The latter importuned us, and we finally gave them the shake. We were loaded in two wagons, and the colored porter "took up the white man's burden" and stored our dunnage under the seat.

We had three dogs of our own, and with the Kingston addition we were apparently well supplied. A few miles out we came to a spot where we thought a covey of quail might exist, so we cleared decks for action. W. A. led off with the Kingston pup, and the pup started for home. W. A. tried to head him off, but the beast gained a lap. W. A. shied his gun at him, tripped over a cotton bush and disappeared between the rows. One of the party let a charge of No. 10 shot fly at our Kingston friend, and his motions were accelerated by forced draft, and he seemed to shorten by a foot from the rear. Whether he reached Kingston head on or not we never knew.

The fields were covered with cat briers and sedge grass, and we were "high steppers" like the Pirates of Penzance. We disturbed a covey of quail and they disappeared like rockets; not a gun was fired. We were a fine trio—a novice, a sluggard and a darn fool. One admitted the situation was novel to him, another said he was too slow for that work; by the way the dog looked at me I assume that I was a fit subject for the third appellation. The dog could not be induced to stay with us longer, and went over to his master and kept with him thereafter. We moved off, each determined that the next chance would be improved. There was a disturbance in the grass ahead, and a bird arose. Six shots went off in as many directions, and the bird, a little thing, went off in another. Ashamed to look each other in the face, we separated, and I accidentally met one of the trio later at a creek. Inasmuch as I had on top boots I offered to carry him across. Grasping him around the knees, we started over, while he took off my cap and fondly patted my bald head. "Familiarity breeds contempt," I slipped on a slimy stone and dumped my burden, then went down myself to rescue him from a watery grave. We scrambled ashore, and I asked him why he did not hang on. "Hang on to what?" was the reply. "There is no capillary attraction in a bald head." To be thus twitted of physical defects seemed unkind, yet he was my friend, for he always had stocks that he wished me to possess on a low margin. If they were with him then I had watered them sure enough. Gun stocks are all that I own, and are near enough to Consolidated Gas and National Lead to stampede a bear when a bull is not made of it. The others brought in four quail. One had evidently died from fright, another had been dead a week or more, and the other two flew into W. A.'s pocket for safety and had suffocated. The three required to make the seven were claimed by the aforementioned "literary cuss" and probably had a legendary and mythological origin, because we never saw them.

In due time we reached the wagons, and started for the hotel at Seven Springs. On the way we came across a persimmon tree bearing much fruit, while the ground bore more. After an endeavor to partake of the fruit, and because my mouth was puckered so that I could not pronounce "truly rural," the others judged that I was on the verge of incipient paresis. Well, we reached the hotel at Seven Springs—the only building in the vicinity of said springs. There were seven of them, and very likely were dug by the delicate fingers of Hygeia while her papa, Esculapius, stood by with packages labeled "Asafetida," "Bisulphide of Carbon," "Iodoform," "Ipecac," "Bichloride of Mercury," "Cyanide of Potassium," and "Nux Vomica." They all say that wonderful cures have been brought about by the use of these waters. They say that an external application from one spring will cure anything from a birthmark to deformed feet. Another one is a certain sure cure for something else, and all combined they will cure everything. What a home this would make for Lucretia Borgia.

There was an ancient mule in the yard, and loving animals, I interviewed him. His ears swayed with the west wind, his lower lip hung pendant and apart from its mate and met only when tickled by flies. His general appearance denoted senility, and while I felt sorry for him, I wondered why he had no pride of ancestry or hope of progeny. I approached closer for a more intimate acquaintance with this pensive hybrid, and a darky's voice sang out, "Git awar from dat muel; he'll kick the belly offen yer." He did not, but a pair of steel-jacketed projectiles went by with a high trajectory, great initial velocity and presumably great penetration. He had pressed a button—I had done the rest, and came near getting a puncture, and no repair kit on the place.

The next day, wishing to be alone, and considering the pace of the others and the weather too hot for me, I strolled away, taking my gun, a rubber drinking cup and some pilot bread in lieu of a compass. Down near the Neuse River I saw what I imagined might be Poe's "Raven" perched not on a bust of Pallas, but high up on a decayed cypress. I recited a few verses from Edgar's best work, with no apparent effect upon the bird. Then I shot at him and remarked, "That the feathers flew if nothing more; sail, you buzzard, for the other shore; if I see you again I'll make you sore with the leaden hail of this 12-bore." Shrieked the buzzard, "An open door." He had evidently been watching a fish that had turned turtle in the river below, and I presume that when the fish became gamy enough to suit his fastidious taste he returned for lunch. One need not go to Europe to find "something rotten in Denmark"; go South, get an introduction to a turkey buzzard, and go slumming with him.

My wanderings led me along the watery labyrinths of this sluggish yet turbid stream, by towering cypresses, looming like masts against the sky, by deep dells, shady and cool, rich under foot with rank grass, spongy green moss and ferns, while overhead among the branches of the oaks, cypresses and palmettoes hung gray festoons of Spanish moss. On the upland, where the frost had free access, the bright hues of the autumn foliage had changed to a rusty brown. In the openings of the forest the blackbirds hovered in clouds; on the shores of the river the meadowlarks fluttered from the stem of one dead weed to another. A startled rabbit caused a startled dreamer to ejaculate, "Gee!" Brer Rabbit stopped altogether instead of geeing. I was about to shoot when it occurred to me that it might be unlawful. Having a copy of the North Carolina game commandments with me, I adjusted my glasses to look up the

law in the case, supposing of course that the cottontail would wait for the decision. I found that I had the right, and when about to exercise it I could not find the rabbit. He had obtained a change of venue. Another time I'll shoot first and look up the law afterward.

Breaking out through the dense undergrowth, I came suddenly to a small clearing and saw a woman struggling to roll a small bale of cotton into a cart. Near at hand was a dingy cabin, leaning against a corner of which was something in the shape of a man and seemingly indifferent to the woman's exertions or efforts. I thought they must be of the race known as "poor whites." I put aside my gun, boosted the cotton aboard and asked her what she had that stick in her mouth for. I found out that it was a snuff-dipping process, and had an offer to try a new bad habit. "Not to-day, thank you; when I try it I'll furnish the outfit myself." I talked with her a while, gave her some loose silver pieces and a pair of new linen handkerchiefs that a thoughtful wife had packed in my grip. She seemed grateful, so I left her, to see his majesty at the cabin corner. "Hello, old man," said I, "this is a good farming country." His reply came slowly and stupidly, "Reckon so, but it is hell on women and mules." Oh, the lank duffer; I wanted to punch him, but did not dare to. I gave him a withering look, but he did not wither perceptibly. He was six-sevenths drunk, and I thought that another drink and a substantial kick would knock him out. His eyes were mild even unto weakness; he wore a full beard, full of tobacco juice, dust and parasites; hair was growing in his ears and grass under his finger nails; too lazy to scratch himself where he itched or to get away from a bonfire in July; he was as worthless a commodity as a can of swill in August; nevertheless an American citizen, with the right to pack caucuses and to vote either ticket. I asked him if he could sing "Ben Bolt," what he thought of the soap trust, and if he really believed that "cleanliness was akin to godliness." There were no children about. The theory of the survival of the fittest is good, and it may be well that the species is not perpetuated.

I felt tired and left him. Pigs roam aimlessly around this country, and seemingly have no homes or owners. You run across them in the most inaccessible places and far from any habitation. In stepping from a fallen log I stepped upon one of these sleeping porkers. Heels and heads changed places; the stars twinkled merrily for a few moments, and singular to relate, when I had caught my breath my coat had caught fire by the ignition of a box of matches that had been crushed by the fall. The pig came back and sang to me, "Nero fiddled while Rome burned." I wondered what breed these pigs might be. Maybe razorbacks or peccaries; maybe the game hogs you read of so often; anyway, one of them came near killing more than he ought.

It was the habit of the others to play cards in the evening—old maid, I presume. The game did not interest me, so I employed a darky (call him Jake) to gather all the coon dogs and their owners in the neighborhood for a moonlight hunt for the festive coon. Unknown to the others, I sneaked away and met the gang down in the valley. Stumbling through the brush, falling into dark holes, bumping into trees, etc., for a while, we finally let go the dogs, and the fun began. In proportion as the dogs wailed, so did the darkies become excited. I chased Jake's lantern around until I was puffing like a donkey engine. After a while the dogs changed the song and Jakey said, "Dase treed him, suah!" We came to the dogs finally and found them trying to climb the tree, falling backward repeatedly and trying again. We roped the beasts, and it was my pleasant duty to attempt to hold two of the worst while the boys chopped down the tree. My instructions were to hang on until the tree fell, then let go everything. Manfully I tried to do it, yet I was pulled here and there, bitten and scratched, rolled in the mud and mixed up in a dog fight. With a crash the tree was down, and six dogs, as many darkies and one little coon were scrapping together in the fallen tree top. The battle surged my way. I was tripped, the lantern was smashed and Egypt's plague was about us. I know little of the vocal capacity of the howling Dervishes, but if they can outdo a band of Carolina coast darkies they are proficient. Between the dogs and the darkies the coon was captured, or at least the pieces were, and we returned to the hotel. It was after midnight, and Jake persuaded me to assist him in a raid upon the hotel hen house. I had never enjoyed the delights of chicken stealing, therefore improved the opportunity. Jake captured his and carried it home. After securing a noble rooster, I went to our quarters in the long, shed-like addition to the hotel. The latch strings were always out, so I threw the bird on to the bed of two of my sleeping companions and immediately returned to my own room. Pandemonium raged in the next room. There was a howling of bird dogs, smashing of crockery, the men's angry voices alternating with the crowing of the chanticler. Satisfied with my day's mischief, I slept soundly until morning. There being no illicit stills to raid, and there being no prospect of creating a race riot, two of us separated from the remainder and brought up in Goldsboro, N. C., that evening. We had stopped at La Grange long enough to see a flying steer, which was attached to a negro's cart, dash up the road with head bent, tail erect. We saw the pickaninies spilled out from the cart and distributed along the road like the links of a chain of thought. The cart went around the corner on one wheel. The wife was hugging the husband, the husband hugging the seat, and the whole outfit hugging the pole.

We arrived at Havre de Grace the next day, and after proper arrangements there was a fine prospect of utilizing the 8-bore gun. "But that is another story," as Mr. Kipling says.

W. W. HASTINGS.

NEW YORK CITY.

A coat-of-arms adopted for Deer Island, the site of Boston's reformatory, has a deer's head above the motto "Strong yet Mild."

THE FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

In Southeastern Texas.—II.

A Dismal Night near the San Jacinto.

"WELL, what do you think of it?" asked my partner, Mr. Talliaferro, as he ceased reading to me a brief he had prepared in a suit we had pending in the Supreme Court at Galveston.

"It seems to me to be exactly appropriate; just what we are after," I replied. "I'd bolster up that point as to the equities of a vendor's lien with an authority or two. Day after to-morrow I'll look the matter up and see what there is in the books on that head."

"Day after to-morrow? Why not now? Our time limit with the court is about out. I would like to send the brief at once for filing."

"Oh, well," I replied, "there will be plenty of time. I am tired to death. This morning's wrestle with the commissioner wore me to a frazzle. I feel actually flabby."

"You are an old humbug, Long," cried Talliaferro. "Talk of being tired. I'll warrant you are at this moment expecting that lumbering old tramp, Briscoe, and you and he will be off hunting."

"Yes," I admitted, "I am expecting him along presently, but—"

"But, fiddlesticks! You two chumps affecting to be tired from your work, will get into his old ramshackle

berry and lablally pine—bordering the San Jacinto. Within its shadows, about a mile from the edge of the prairie, we came upon the banks of Silver Lake. No lake of hill-country character was this of the San Jacinto bottom, fed by spring or catch of surrounding watershed, but only a bit of an old river bed, left long ago in some high-water cut-off. Such lakes are familiar land features to folk of Western river-bottom experiences. In Florida such natural formation would be termed a lagoon. While yet a bit of light remained the team was ungeared and the four brutes tied up and fed. I made coffee and spread a snack. Briscoe filled and trimmed two lamps and lectured the boys the while as to how they should deport themselves. Supper over, we smoked, and Briscoe said: "We'd better ride back to the prairie and hunt along the timber's edge to-night. Separating, we can ride in opposite directions, each with a boy as companion. Certainly, with timber on but one side of us, open prairie on the other, a clear sky overhead, with stars all aglow, we can safely trust to keep our directions. Choose your partners, lads, and saddle your own horses."

"Well, I'm going to stick to you, uncle," cried Hal. "Which suits your Uncle Fuller all right," said Joe. "Mr. Long and I shall ride forth together to arouse the wild stag from his native lair and shake the dewdrops from his checkered flank." No you don't; that's my saddle with the double girth and big stirrups."

The pied mare fell again to me. I rubbed her nose,

then bore away from the timber westerly into the prairie, when bang-g-g, came gun roar again.

"Gracious me!" exclaimed Joe, in an injured tone; "Uncle 'Menus is just a-raking 'm. What's the matter, that we can't find any?"

"Hist!" I whispered, as at the moment I descried two great luminous disks gleaming ahead of us. The old horse saw them, too, and with his nail-keg of a head high in air, he waltzed about, facing me away from my find. Rowel and rein fetched him squarely head-on again, and I clearly made out, lying quietly in the grass, scarcely 30ft. away, the body of a large deer. So large, lustrous and mild was the expression of the reflected eyes that I should have deemed them those of a gentle cow; but lying within the lighted radius of the lamp I saw the deer form. I fired, and there lay kicking, dying, without having risen from lair, a great motherly doe, and despite the old gelding doing the ground and lofty, in regular broncho style, I felt as a man might who had kicked a woman; and rammed my mortification into the poor old beast's ribs in most manly fashion. Knocking out an old doe where she lay, in full view, and when I ought to have known that it was a doe, I felt to be an achievement not likely to pass muster with Briscoe. At any rate, it shan't happen again, thought I. Those great, mellow, shining orbs, then, are likely to belong to a doe. I shall remember that. Bleeding and dressing the kill, I soon had it up behind Joe on the mare, where we made it fast, and got

road-wagon, go bumping for miles over a hog-wallow prairie, stay up all night proging around after deer, tramp the coverts all day to-morrow in quest of chicken, then gad about to-morrow night again and turn up here the next morning, smoked, dirty, red-eyed and tick-biten, and declare you are so 'refreshed' and 'reinvigorated.' Pshaw! I despise savagery."

"Try and compose yourself, you inky old pen-wiper. You are talking excitingly about what you don't know. Besides, who was it who, only yesterday, was expatiating so enthusiastically to Judge Cook about 'a grand run' he had been in after 'an old red' up in Virginia, and about 'music of the dogs'?"

Here we were interrupted by the appearance at our open door of a handsome, big-eyed boy, who said: "Uncle 'Menus wants Mr. Long to come on. He is in the wagon, waiting."

"All right; I'll be there at once. Good bye, old man." I said to Talliaferro. "Cheer up a bit. Put that paper away. Borrow Hornburger's terrier, take a cast around the block; you may jump a Tom, a real old brindle, in the back alley, and—"

"Oh! go on." And I descended the stair. Below I found Briscoe and a youngster, quite as big-eyed and older than the one who had summoned me.

"I was doubtful about coming for you," said Briscoe. "These are my nephews, Joe and Hal Baldwin, from Alabama; with their mother they are visiting my people. Their grandma has been stuffing them full of accounts of our hunting, and they set their hearts on going with me. I fear they'll be a lot of trouble. I have the carriage horses along to mount them. We will—"

"Make them have a good time," I interrupted. "Have you ever camped out, boys, and killed deer?"

"We have never seen a live deer in the woods," said Joe, the elder. "We camped out once, up on the Warrior River, with papa. We were fishing."

"Here! climb in," called Briscoe. "I want to get to the big timber on the San Jacinto River, if we can, before dark. We will camp near Silver Lake. It's getting late; let's be off. Won't you drive, please, Mr. Long? I'll have to hang on to these two dromedaries, who are none too ready at leading, I find."

We were soon beyond the town. It let old Jim and the pied mare have their heads. They soon seemed to know our destination, and about dusk we reached and entered the belt of timber—past oak, pecan elm, hack-

stroked her neck and saddled her carefully. As there would be no moon, and we would probably make a night of it, lamps would need refilling; so to cantele I suspended by buckskin thong a bottle of kerosene oil, then to the pomel hung a blowing horn, and across the seat slung a canvas wallet, in one end of which was a bite of lunch, a bottle of water, and in the other end was placed pipe, tobacco, matches, twine, pocket compass and a hatchet. Around the mare's neck, suspended by a light strap, I hung a small sheep bell. This, haging down upon her chest, was jostled, and tinkled as she moved, and was intended to excite the curiosity of listening deer and induce them to stand and peer toward the sound. Briscoe was somewhat like accoutered.

Baking the fire, we mounted our respective nags and rode away together, lamps a-crown, along the road, through timber to prairie, followed by two wonderfully excited boys. Separating at the edge of grassy plain, Briscoe and Hal rode northward, while Joe and I trooped away to the south. "Good luck to you, and may the old Parker do you proud," I shouted. "Thanks; same luck to you," he called back, and presently the Texan's moving lamp was a mere wabbling speck, or spark, against the curtain of the night.

There is a certain nervous alertness, a watchful eagerness of discrimination, attending this riding afield in the night, which, coupled with the absolute silence, necessarily maintained, is a bit gruesome, or at least awesome, and engenders a highly wrought sense of intense purpose that is exciting in the extreme.

After riding but a short way Joe's old horse, separated from his mate, grew restive and began to neigh and generally misbehave. The little man from the Coosa country was no experienced horseman, and I discovered by a tremor in his repeated "Whoa, sir," that he was getting rattled. Fearing I should have to turn back on his account I determined to exchange mounts with him. The appendages of my saddle were many, and to avoid loss of time in shifting gear I merely altered the length of the stirrup leathers, placed him on the mare, and mounted the old gelding myself. As we again made head there came the report of a gun from a mile away northward. "There barked the Parker," I cried, "and that old Texas kinsman of yours doubtless leads us a good head of bones."

A little way on, finding no eyes, I took the sheep bell from the mare's withers and hung it at my saddle bow,

under way again. Joe was evidently disappointed at the absence of horns. "Shucks!" he ejaculated: "I wonder if those Uncle 'Menus has shot were sows, too."

The grass began to be taller and coarser, the ground surface was gradually falling away, and had become quite moist. Slightly changing our direction to the northward, to regain dryer ground, I suddenly caught a glimpse of something—eyes of some sort, surely. A living, moving thing of some description, with as much chick and get-up in them as I could well imagine. It was only a glimpse I had of them, and they were gone. Nothing big, or round, or soft about those blinkers; only two little, blue sulphurous prongs, set close together, diverging outward at the top; but how wonderfully "piert" and full of character. Instinct, for I had never seen the like before, assured me that I had looked squarely into the face of a knowing old monarch of a herd. The will to have him seized me body and soul, and my gun came into ready position, whereat the cowardly heart of the old town brute I bestrode began to quake; he wheeled away and made ready for more circus business. I at once dismounted, passed the reins over my right shoulder, and faced quickly toward where had been those wonderfully knowing, shining glints. Instantly, a little further away, flashed the strangely intelligent glance. My gun came up, a finger twitched, and nine leaden pellets went whorling out into the night. A confused sense only of what transpired in the next half minute has ever stayed with me.

The rank grass, high as my shoulder, was damp, the undertread wet. A great puffed outspread of white sulphurous smoke rolled over the prairie growth. Like a monstrous snowslide it convulsed and spread, gleaming in the lamp's light like a great bubbling bank of molten silver. The abominable old beast at my elbow crouched trembling and walled his bleared eyes at the sight until they seemed to stick out like those of a crab. An instant more, a light breeze set the sulphurous cloud rolling toward us, and out of it came rearing a great antlered head of branching horns. I jumped aside to avoid a rush so dangerous. The frenzied old Conestoga did likewise, but he went the other way. The attached reins snatched me heels over head, my gun was yanked off in the dark, while the lamp and headgear sail clattering into the high grass, and then the lamp went out. With furious snort of utter demoralization the beggarly brute broke away from me and cut with might and main across

the prairie. In the bewilderment and distracted excitement I shouted, as I scrambled in the grass, "Catch him!" Poor little Joe, quite as disconcerted as I, dashed away in the dark in pursuit of the tinkling bell on the old horse's neck, and that rattling, clattering guide soon led him far beyond my hearing, while I stood panting, listening there in the dark.

"Hang such ill-luck!" I thought, and began groping about for the lantern, having but half sense of what direction I last heard it rattle; but presently I stumbled over it, and then discovered that all the matches were in the wallet on the mare, as was water, pipe, tobacco. Very evidently I was hove-to until morning. I must not leave Briscoe's gun. Once lost the location, I might be days finding it again. My horn was gone, too; no chance of notifying Briscoe that way. Ah-ha! the very idea; fire signal guns. I have four loaded shells in my pocket, there is still one in the gun. Yes, I'll hunt the gun up. Let's see. Humph! I'll just have to crawl around and feel for it. I must find it. So to work I went, with a strong heart and an upper lip as stiff as a car bumper. It was going to be a bit tedious, of course, crawling around and around in enlarging circles through that tall, dank grass, but it must be done and persevered in until the gun is found.

In a very little while, on all-fours, carefully exploring with my hands every foot of the soggy ground, I heard something—not a boisterous racket at all—just in front of me on the ground; no vague conjectures troubled me as to what caused it; my Florida senses caught on instantly; they had heard the like before, and marked it sure for the dry, husky, blowing hiss of a great, scaly, stumped-tail moccasin snake.

As the situation became apparent I was struck with the inappropriateness of my employment. Parts of my philosophical anatomy ceased crawling at once. The flesh of me kept at it for dear life; but my old bones and clothes anchored where they were. Cassabianca's heroic regard for parental injunction was mild and watery compared with the resolute steadfastness with which the sigh of that old serpent inspired me.

Radical change of circumstances usually demand corresponding change of conduct. The hiss of that scaly old reptile instantly dispelled from my mind the urgency of firing signal guns. It seemed so much more appropriate to wait. I remembered to have heard it reliably stated that "all things come to him who waits." Yes, clearly, I'd wait. Presently came the nasty reflection that with "all" the things likely to "come" while I paused there in the gloomy moisture, that old stump-tail might naturally wriggle along with the rest, and my bowels literally yearned for some or any place or thing of rescue. Overhead the sky was superbly beautiful. Low on its southern wall was reared the curved outline of the great scorpion. High in the east twinkled on the broad shoulder of the Bull the mystic Plades, and blazed with seeming unusual grandeur the bands of mighty Orion. Gazing thoughtfully at such manifestations of order, I had quite forgotten the circumstances of my situation, when there fell faintly on my ear, coming from the eastward, toward the timber, the sound of a whining yelp. A gentle breeze had risen and was blowing steadily in that direction. Yep-yap-yap-yep, yep-p-p, came again up the wind. "H—m," thought I; "coyotes. Certainly a nice-assorted lot of stuff 'comes' to a fellow having to 'wait' after bedtime in a Texas prairie." Shortly arose, a little way beyond, and southerly of my snake-fast position, satisfied me that "old Blue Light" was setting up the funeral meats there away. What a shame to have bowled over so superb a kill and sit there in the dark, like a frog on a tussock and listen to those snarling varlets rend it. Hunter's impulse seized me to rush in, drive them off and rescue my quarry, but the vision of old forked tongue lying coiled near by, perhaps in very reach of me, watching me, silently, flashed athwart my mind, and as instantly I froze solid to the ground I sat upon. No, I believed I'd go right on waiting. Daylight was certainly to be numbered among "all things"; its turn would come presently. Indeed, so fixed were my staying qualities whenever I recalled that ominous, wheezy hiss, that had the very prairie resolved itself into a colossal bronchio and giddily bucked itself blind, 'twould scarcely have jostled me.

Hark! Briscoe's horn, quite three miles away, to the northeastward. "At the camp," I muttered, "where, not finding us, he blows his horn to guide us there." Well, I could not answer; but those measly coyotes did. After some time the old Texan fired both barrels of his gun in quick succession, as signals. "Poor, anxious old chap," I thought, how lonely and disconsolate he must be there in camp, with only a fire, boy, two horses, pipes, tobacco and his gun. I was seriously tempted to go at once to his relief; yet I did not.

Finally the morning star had climbed away up the eastern sky. Gray tints began capping the timber line thereaway. In a little while I arose gingerly from my wet lair and cautiously stretching cramped limbs, peered about as best I could in the dim light, and there, not 5 ft. away, lay the lost gun. Getting quickly hold of it, with lamp in other hand, I picked my way, watching eagerly for snakes, toward the northeast.

As the sun began to show at the point where Houston road entered the timber, I came upon Briscoe and little Hal riding out in search of Joe and myself.

"Where's the boy and the horses?" he cried, anxiously. "Up about Waco by this time," I answered, "if they have kept the gait and direction they were going when last I heard from them." I greatly relieved him and amused him by my account of what had befallen us.

"They are likely in Houston, at any rate," he said. "Well, certainly you have passed a trying night, and you show it. Get on my horse. I'll mount Hal's and take him behind me. Let's get to camp. A little snake medicine and some coffee will pull you together again."

"Look yonder!" cried Hal. "There is Joe and a man." There, coming briskly along the road, sure enough, was Joseph and a ranchman, the latter leading the old horse that had so unceremoniously deserted me the night before. "Hello, Briscoe!" cried the newcomer, familiarly. "I'm a-fetching back part of your crowd what kinder got strayed, seems like."

"Good morning, Hudnel," answered Briscoe. "I thank you heartily for doing it; but where did you find them?" "Find them?" Why, they kinder found me. They come a-tearing up to my corral last night and my whole cav-

illard a-leading of 'um. I 'lowed some one or nuther was atter my stock, and I tumbled out with my Winchester. 'Fore I sed what to p'int at I heard what 'peared like a chile a-hallowing, and the fuss thing I knowed this here little chap rid' right up to me. I knowed that thar p'd mare for your'n time I seed her, and kinder ketched on to something being wrong wid you somewheres or nuther. I tuck the little chap in the house, and when he got sorter quiet like—fer he were powerful shuck up—he tole me 'bout whar you was, and this here horse a-gitting away from that thar gentleman, and him a-following of the bell till they run into my stock of horses, what was a-grazing in the per-rai-ry, and then I knowed jes' how hit was, and soon's it come day we sot out to find you."

"Well, I thank you for your kindness. This is my friend, Mr. Long. Come, ride to camp with us at the lake, down here. We will have some breakfast and talk it all over. And Joe, my boy, I'm certainly relieved to find you safe and sound."

"Oh, I'm all right now, sir," cried Joe, "and I would not take \$50 for the experience; but I'll tell you, that run in the dark last night got me. I declare, Uncle 'Menus, before we stopped, I began to think we'd go all the way back to Alabama."

While having breakfast we exchanged accounts of ourselves during the night. Briscoe had had two shots, and had knocked down a handsome young buck, which now hung by a gambling stick to a limb hard by.

"Where's the deer Mr. Long says he tied up behind you, Joe?" queried the inquisitive Hal.

"Shucks, boy, I expect the coyotes have licked her old bones before this," replied my man Sancho. "One end of her broke loose and swung down while I was riding after that bell. I was not strong enough to right her up again without dismounting, and I could not stop for that, so I cut the other end loose and let her drop. Was I right, Mr. Long?"

"Decidedly," I answered. I was ashamed of the stupid way in which I murdered that old doe, and did not want to see her again.

"I expect the varmints 'bout here'll come to think a sight of you, Kernel," laughingly said our new acquaintance, Hudnel, to me, "ther way you draps deers 'round in ther grass fur'm. I reckon they thinks hit a plum miracle. Ef you don't mind, some of them hunters thar in town'll hear of it, and git to naming of you 'bout hit."

"Capital," said Briscoe. "I must give that to Talliaferro."

Hudnel had known of occurrences similar to that of the buck's behavior the night before. He thought it probable that the creature, lying down in the grass in front of me, startled by the report of the gun so near, had become bewildered by the smoke and sulphurous fumes, and had naturally dashed toward the light.

To avoid an exchange of experiences and the merciless gaging he would have subjected me to, I never dared ask Talliaferro whether he and Hornberger's terrier had treed a Tom in the back alley.

R. C. LONG.

FLORIDA.

The Old Trapper.

PRIMITIVE instincts die hard. Every now and then we see them cropping out in the modern, highly civilized man, as bedrock crops out here and there on the shorn lawns of your fine estates in the suburbs. I love to meet a man who has some of the spicy sediment of savagery in him yet—a man who is not entirely tamed and domesticated and conventionalized; who cannot entirely strip himself loose from nature, but clings to her at some point, and retains a vital connection with her all his days. I would give a whole city full of mere metropolitans for one of him.

Such a man is the old trapper of the countryside. By profession he may be a farmer or a shoemaker or a blacksmith or a schoolmaster, or even postmaster; but by nature and the zest of the heart he is still a hunter and a man of the woods. The unquenchable love of the primitive and wild burns clear within him. There is something distinctly religious in his devotion. He is a nature-worshiper, a true pantheist, a man who finds God in every aspect and phenomenon of the outer world. Nothing less can account for his ardor to be in the woods, an ardor that even age cannot cool, but which seems to increase within him as his beard whitens and his strength declines. The old trapper surely finds some altar in the woods, upon which he burns the fat of his victims, and before which he swings his censer of musk. Fur is not what tempts him, nor yet meat. Higher gods than those of purse and belly inspire his avocation and attend him to his traps and snares.

You will scarcely find a village or a town, or even a city, anywhere, that has not its representative old trapper—one man at least, among the utilitarian many, who still finds a romantic charm in going to the woods, tasting wild berries and wild flavors of all sorts, and matching his wits and wiles against those of cunning woodland creatures. How recognizable is his figure—that gentle, old, grizzled face, under the slouched hat; the blue eyes a little dimmed, but wide-awake and observing still; the mouth, not hard and set, as is apt to be the case with old men, but relaxed and peaceful as the lips of a child; the slightly stooping, spare figure, dressed in soft curves and hues of old, faded, accustomed clothes; the feet, in dusty, brick-red boots, leisurely of step, yet sturdy and firm; the bunch of steel traps or of pelts hanging from the left hand; the pipe, perpetually alight, as vestal fires, leaving its rank fragrance all along the village street.

Everybody knows the old trapper, and loves him—especially the boys. What a lore is his, not to be found in books! What secrets of forest, stream and air! And it is all of his own getting, written by the stylus of experience deep in his heart and mind. As Sydney Smith said of Macaulay—though in a very different sense—"He is a book in breeches;" but not everyone can read him; like the best of books, he is only to be read by those who love him.

When I was a boy I counted it better than an hour in fairyland or amid the glamor of medieval romance to sit down with the old trapper on some bank under the trees or by the river, and listen to his woodland lore. Then it was that, for once, I forgot morning, evening, and the dinner hour. I hung upon the old man's slow, mumbling words, and leaned to catch them till my head, resting

upon palm and elbow, was almost pillowed in his lap. I fed my eyes on the old, wistful face and blue eyes, looking so far away that I could not believe the trapper was talking to me, and drank the stream of story and of fact that fell slowly, drop by drop, from the lips of the oracle. Because I loved the old man, he opened the book of his life and his heart to me, and enraptured me. He told me of all the strange things he had seen in the woods—things he could not account for, things terrible to me in their mystery, fascinating beyond any romance. He told me of tangible dangers met and overcome in the days of his youth; encounters with the savage wild beasts that then roamed the woods; perils by the elements, by storms and floods and fierce weather; perils from getting lost in the woods, and wandering without food, and sleeping without shelter or protection at night. More fascinating still, he told me how to set and bait traps, how to make snares and dead-falls, how to skin animals and birds and stretch and cure their pelts. He told me how to deceive the wily fox, and find the haunt of the rare mink, and catch muskrats in submerged barrels, and lure hawks into traps set upon poles. He told me how to tell north from south by the trees, how to build a camp of boughs, how to make a fire in a soaking rain and keep it burning all night. But if I should recount all the things the old trapper taught me I should be writing out his book, the book of his long, loving, observant life. And that would be right neither to him nor to the printer.

Perhaps not every day, but twice or thrice a week, in the fall and winter and early spring, you may see the old trapper going his way beyond the skirts of the village, a quiet, unobtrusive figure. Soon he leaves the highway, to follow the course of the brook, or cross a meadow to the woods. No one considers him a trespasser, nor does he ever seem out of place, or going about other than his rightful business. All paths are open to him, and he enjoys always as a kind of inalienable privilege the freedom of the country. Every farmer knows that, when the old trapper lets down a bar, he will put it back in place better than he found it; and if a barbed wire fence proves too close-set for him, instead of pulling a strand from the post, he will go far and patiently until he finds a hollow where he can crawl under the bottom wire. He is not of the lawless, vindictive class, for whom trespassing signs are intended. All he asks is his own divine right in God's country—to walk harmlessly over it, interfering with no man's rights and damaging no man's property.

It is with true neighborly pleasure that the village or town folk see the old trapper coming home, at evening, with his modest spoils. He and his habitation and his ways are one of the institutions of the community. Truly, a country town without an old trapper or hunter is an anomalous, half-fledged place, lacking in local character, picturesqueness and vital connection with the past—that primitive past from which it has, after all, but lately emerged. So long as woods and streams survive, and are peopled by wild creatures, so long will the trapper's function be one of the straight paths between man in the civilized community and God in the free, mysterious, unspoiled woods.

JAMES BUCKHAM.

Real Life in the Woods.

MANY years ago a bark canoe 18 ft. long was paddled down Lake Champlain from the north. It contained an entire Indian family and all their worldly possessions. They found a home among the Adirondacks, and one of them still lives there. For years he was an expert guide; but age and ill health have disqualified him for that service. Farming and basket making now occupy most of his hours of labor. The writer meets him every summer, and many an hour has been passed pleasantly listening to his tales of early days. Last summer he told of an experience which few sportsmen of to-day would like to share. With a brother—both young men—he went into the great woods of Canada for a nine months' hunting trip. They carried no provisions whatever, having resolved to live on game. Sometimes they hunted together, and sometimes were separated for days, but wherever they went each knew

"His faithful dog should bear him company."

Generally they camped together, but worked apart. As their object was fur for the markets, they would stay in one region till it was well worked and then move their camp to some new and unhunted locality. At one time they did not taste food for four days. The snow was deep and the weather unfavorable to hunting. They hunted diligently, but could not secure even a partridge. Though well seasoned and hardy, the continuous tramping began to tell on their unfed bodies. At length, in a sort of desperation, my informant went a long way from camp to a ridge, where it seemed likely moose might be found. He struck a track and followed it until he wounded the animal. Then the trail led toward camp, and hope became dominant. Finally the moose lay down in deep snow and the Indian carefully worked his way up to within a few feet, determined that when he fired again the moose should not arise—and he didn't! The brother was slowly returning empty-handed to camp. He heard the shot and felt that relief was at hand. He brought a kettle, and soon a savory broth was cooking over the fire. After their long abstinence, those men of the woods knew better than to eat meat at first. They took broth, and but little of that until their systems began to rally. But then, how they did eat! They camped by that moose and cooked and ate and rested and recruited for a whole week. Then they were again ready for business. During the entire nine months they tasted no food but the wild meat of the forest. They were not sick a day, and were very successful in securing fur. The catch was sold for something like \$2,000.

When they came out of the woods and reached a hotel civilized cooking was distasteful, and good bread seemed hardly fit to eat.

Some time will give you another chapter of the old man's experience.

Natural History.

Those Alaska Reindeer.

Editor Forest and Stream:

Rev. Sheldon Jackson, who has been for several years so indefatigable in his endeavors to introduce Lapland and Siberian reindeer into Alaska for food and draught purposes, now finds himself compelled to make the most strenuous efforts to save a remnant from wanton destruction, not by the natives, but by hostile residents, who maintain that he has been spending public money lavishly on fool projects, which might have been put to more practical uses for the benefit of the province. And he has written to prominent game conservators for a formulated code of laws to prevent their slaughter. We sent him a copy of the Hallock Code, and duly received an acknowledgment of the same; but we doubt if any measures, however, stringent, will prove one whit more effective toward the end desired than the like have been in preserving the buffalo of the Yellowstone Park, especially as the popular prejudice is against the reverend promoter of economic industries and civilization in Alaska, whom the wild and woolly pioneers regard as a government pet and pie-eater.

To say truth, we do not think ourselves that his latest reindeer venture was wise. We mean the importation of animals from Europe, and the attempt to establish an overland reindeer express from Dyca to the Klondike mines. At all events, it was a signal failure. But that ought not to damn all that he has done for southeastern Alaska and the western coast during the past twenty-odd years. Through his instrumentality, or example, no less than forty schools and missions have been established since the purchase, in addition to the Greco-Russian schools which already stood, while his industrial and technical school at Sitka has been a model for others throughout the States. The prejudice against him is unaccountable, but it is of long standing. In 1885 I stood on the deck of the outgoing steamer, the Ancon, and saw Mr. Jackson prevented from taking passage for Washington on some technical pretext for detaining him, notwithstanding the presence of the District Attorney and other officials who were on board. Mr. Jackson, be it known, is the United States Superintendent of Education for Alaska. But the residents in those days were lawless, and in these days scarcely less arbitrary. Only say "reindeer" to one of them, and it is at once the occasion for a sneer. However, everything done will doubtless appear in its proper light eventually, and the preacher's motives at least be vindicated.

CHARLES HALLOCK.

About Bears.

CALAIS, Me., Feb. 7.—*Editor Forest and Stream:* Mr. Arthur Erwin Brown, in FOREST AND STREAM of Feb. 4, had a picture and interesting paper about young bears. They are queer animals, and the ways of the wild female almost past finding out. There is an old expression of Pliny's, "licked into shape." Walsh explains it as having arisen out of an early superstition that a bear's cub is born an amorphous mass, and is licked into shape by the dam. The ancients took it as a serious statement of natural truth, Pliny giving the following account of the phenomenon: "Bears, when first born, are shapeless masses of white flesh, a little larger than mice, their claws alone being prominent. The mother then licks them gradually into proper shape." Shakespeare, in Henry VI., Part iii., refers to this superstition in the following lines:

To disproportion me in every part,
Like to a chaos or an unlicked whelp
That carries no impression like the dam.

There is interesting bear reading by Pallas, Pennant, Godman and Richardson, but not much about the very young bears. Here in Maine and New Brunswick our very cold weather with deep snows rarely fall before the last of November, and bears usually take to their dens about that time for hibernation. The male bear is easily satisfied with any kind of a hole, behind the root of an upturned tree, a hollow cliff, or in the end of an old hollow log. But not so with the female if she is parturient. She selects a very obscure place, and makes as the Indians say, "a soft feather bed of fir branches." Our bear hunters and Indians all attest to the truth of the deep privacy of the female in denning, and it is not often that her den is found. It is a maxim with our bear hunters and woodsmen that no one has ever taken a she-bear with young, and it is said to be a fact that if disturbed she will always abort. Richardson, quoting from Pennant, and Godman both attest to the deep privacy of the female, and to the saying of the Indians that the female bears went like the wild geese south in winter. It is said that the female bear is always very fat in the fall, while the male is wasted by the September rut. It is said there is seen at times over a bear's den a kind of sweat or vapor that will conduct a dog or man to them. They are never entirely unconscious. If you poke them with a gun or stick they will growl, but relapse again into repose.

The number of young is usually two, but often only one, very rarely three or four. The young cubs are queer helpless little things when first born, which is about New Year's day. They are not much larger than a full grown red squirrel, weigh from 8 to 100z. and measure from tip of nose to the end of hind toe about 10in. They are covered by a fine close black hair upon the back and head, but bluish slate toward the belly and inside the limbs. The ears are naked, the eyes closed, the tongue exposed and jaws slightly open, no teeth, claws large, tail long for its size. After birth the cub receives but little food, and passes the three or four months in semi-torpor, and grows but little until the parent emerges, and then quite fast. It is singular that so large an animal, that often weighs 400lbs., should give so small cubs.

In this bear hibernation destroys maternal instinct. She will always leave her cub to freeze when driven from her den; but in April or May keep away from

her. That an animal so highly organized as a bear should be able to retain not only its vitality, but its animal heat and its muscular strength for four months without any food whatever, is well attested, knowing as we do that in this time, if there be no supply there is no waste save perhaps animal heat. But when we consider the female, we find there is waste and no supply. The material for a second life and its growth must be taken from an accumulated fund. An atmosphere saved only by the animal heat of the mother from that without the den often down to zero and a torpid mother await this blind-born, feeble offspring. By some instinct it is led to the mamma, where, like certain marsupials, it retains a firm hold upon the nipple, and now a change comes over the still torpid parent in the increase of the lacteal glands to secrete milk; and a wonderful fact is that no food is taken by the parent during both operations. And how wonderful the polar bears, whose retreat must be doubled in length and severity by the arctic latitude and ice-formed den.

I have found great trouble in getting specimens of very young bears. The hunters, always in a hurry to get their bear bounties, take them to the treasurer for the money, and he cuts off the nose from the skin of the old one and the whole head of the little ones. In my many winters in the South, and in California, where bears do not den, I have never been able from the hunters to find one, nor ever had seen one until it was old enough to follow the mother.

GEO. A. BOARDMAN.

More about Skunks.

PEMBROKE, Feb. 17.—*Editor Forest and Stream:* I have read with interest the numerous articles which have recently appeared in your paper, relating to the skunk; how one learned professor was struck in the eye with a well directed shot from "his battery," while in quest of scientific knowledge; how "Podgers" was compelled to seek safety in the house, and how a farm hand took such awful chances in removing a skunk from a milk house.

Last autumn while we were trout fishing, two skunks took up lodgings under the veranda of the club house, and as they were a nuisance, we at once set about to devise some plan to get rid of them. Some one suggested putting the muzzle of a gun close up to them and blowing them to pieces before they had a chance to get back at us, but this was voted down as impracticable. Another suggested cutting a pole about 15ft. long and stout enough to raise a skunk and an ordinary steel mink trap from the ground. This was done; and to the end of this pole we fastened the ring on the end of the trap chain and gave the chain a couple of turns on the pole, baited the trap with scraps from the kitchen, set it, and soon had a skunk. The chain was then wound up by turning the pole till the trap was near enough to allow its being lifted from the ground conveniently. The skunk was cautiously carried to the lake, care being taken that he should not touch anything, was plunged into the water, held there for about fifteen or twenty minutes, and when taken out was quite dead, without any odor whatever. The trap was again set, and in a few minutes we had the other.

The same performance was gone through with the same result, so that in about three-quarters of an hour we had the two skunks dead and buried, without the slightest trace of any odor.

I can confidently recommend this plan to any one annoyed with these animals, but care must be taken to avoid all unnecessary noise, and that they are not touched or injured in any way, other than, of course, that caused by the trap, and also that they are left in the water till all the muscular contractions are over, as if not, these may cause a discharge of the scent.

J. D. DEACON.

That Sinnaker Bear.

Editor Forest and Stream:

In your issue of Feb. 18 you ask for further specific information regarding the variety of bear mentioned as the sinnaker bear in my letter about "Old Bob Gerry of Hyde." I should have perhaps thought it of sufficient interest to zoologists, to mention in that sketch that there is a big black bear (much above the average weight of black bears), which uses in the swamp and canebrakes of the coastwise States from the Dismal Swamp in Virginia to the lowlands of Louisiana. Your Mr. Hough mentions it in one of his most interesting Bobo letters printed in FOREST AND STREAM last year, confirming all that I have stated, and perhaps establishing as a scientific fact, under the modern scheme of differentiation, that there is a typical swamp bear, as stated, which carries a white spot on his breast as invariably as a skunk carries a white tip to his tail, or an ermine a black tip to his. I will quote what Mr. Hough says, though I cannot give the date of his letter. It is to the effect that "there is in Louisiana, Mississippi and sometimes in the southern Arkansas canebrakes and swamps a big, perfectly black bear. It is generally marked by a white horseshoe on its breast. This bear will weigh from 400 to 680lbs. The writer saw one weighed on an accurate set of scales, made for weighing bales of cotton, to be found at all steamboat landings, which pulled down the beam at the 680 notch. It was killed in the great Atchafalaya Swamp by an experienced hunter, who declared that this was not the ordinary bear, but of a different family."

CHARLES HALLOCK.

Flowers which Bloom in the Spring.

FAYETTEVILLE, N. C., Feb. 19.—*Editor Forest and Stream:* I inclose you some fresh hyacinths grown out of doors, which have never had a house warming. You will observe that they look vigorous and hearty, notwithstanding they have endured the fifteen days of frigid weather here with a thermometer ranging from 30 to 12 degrees for five days, and a subsequent burial in snow 15in. deep. To-day the snow is gone, but the hyacinths are standing up straight. Can you explain why an arctic experience which would kill out-of-door plants in the Northern States have little effect on the same here? Before this freeze we had japonicas, winter violets, orange jasmine, daffodils, etc., in bloom out of doors, following severe weather, and 6in. of snow on Jan. 26. If it kills oranges and vegetables in Florida, why not the garden flowers here?

CHARLES HALLOCK.

Flying Squirrels.

Editor Forest and Stream:

I am surprised to find that I know a very little about another subject mentioned in FOREST AND STREAM—flying squirrels. My predecessors in my present residence had not used several rooms in the house and no fires had been kept in some chimney flues. Hence, the flying squirrels got to roosting in these flues and became great nuisances, coming down the flues into the rooms. We used to catch them on the plan of boys—clap a thick something, a cap or some such thing, over them and pick them up, and I kept some in the common squirrel cage for quite a while. They got tame enough in a week to take a nut out of my hand. Finally, to cure the nuisance, I had wire gratings put on the tops of the chimneys.

My neighbor, a bricklayer, was capping out one of my chimneys, and on turning round from getting a trowel or mortar, saw a squirrel perched on the chimney, which swooped down to a tree near by; in a few minutes the same thing occurred again, which John thought was very remarkable; but when about half a dozen succeeded each other in this spookish performance, he certainly thought he must have "snakes in his boots," and I don't know but that he might think so yet, had he not seen one rascal stick his nose over the inner edge of the chimney.

W. WADE.

Weights of Quail.

ERNESTVILLE, Pasco County, Fla.—*Editor Forest and Stream:* In answer to Didymus, I generally weigh my game, and scale my fish (no pun intended), and find that a quail of 50z. is small; 5½oz. is about the average, 6oz. large, 6½oz. extra large. I consider quail about 20z. heavier than doves, although last week I shot two doves that weighed 50z. each.

Some years ago I shot in California and Oregon a few mountain quail very much larger—the exact weight I forget. The quail in the valleys there are no larger than in Florida.

It's all right about the man shooting from the hip; he has a blunderbus, and his extreme range is 6yds. I don't shoot with that man.

THOS. B. DOBELL.

Game Bag and Gun.

Proprietors of fishing and hunting resorts will find it profitable to advertise them in FOREST AND STREAM.

March 2-15.—National Sportsmen's Association Exposition, New York.

The "Brief's" Pictures.

THE illustrations in the current edition of Game Laws in Brief, Mr. Charles Hallock says, well represent America's wilderness sports. The Brief gives all the laws of the United States and Canada for the practical guidance of anglers and shooters. As an authority, it has a long record of unassailed and unassailable accuracy. Forest and Stream Pub. Co. sends it postpaid for 25 cents, or your dealer will supply you.

Shooting from the Hip.

Editor Forest and Stream:

I have read with much interest the articles recently published in your paper in regard to shooting from the hip, and am surprised that the merits of shooting in this manner seem to have been so little known or appreciated. I have known of a number of persons who have shot in this way with very great success, and they have always claimed that they very rarely missed their birds.

Mr. Jackson Van Wyck, of Fishkill, who died some years ago, was for very many years before his death regarded by those who knew him as the finest shot in this county, and to say that he very rarely failed to kill his bird is to speak entirely within bounds. During his whole life he invariably shot from the hip, and he always claimed that he could shoot more accurately in this way than from the shoulder.

On one occasion many years ago I was with him when we flushed a partridge in thick cover, neither of us saw the bird, but he guided by the sound only, raised his gun to his hip, fired and killed the bird, and in two or three moments it was brought in by the dog.

On expressing my surprise, he assured me that this was a very common occurrence, and I have been assured by those who have had the pleasure of hunting with him that this was true.

Some years ago a young gentleman, living in this city, and then about fifteen or sixteen years of age, was spending his vacation at Rockwell's, at Lucerne, in the Adirondacks, and on one occasion while there was permitted to join in a contest for a prize to be awarded at the most successful shot at glass balls, and to the surprise of every one, he shot exclusively from the hip, never missed a ball, and carried off the prize. On two or three other occasions while there he was almost equally successful, very rarely missing a ball.

During his visit there he very frequently accompanied one of the guides who was shooting game for the table, and he very rarely missed either partridge or woodcock.

There are probably many readers of your paper who will remember this occurrence, but I refrain from giving this gentleman's name, as I have not asked his permission to do so.

What makes this last instance more remarkable is the fact that this person was very near-sighted, and was always obliged to wear glasses.

These are two instances upon which I can speak positively, but they certainly bear out the contention of Jacobstaff in his interesting article in your issue of this week.

J. S. VAN CLEEF.

POUGHKEEPSIE, Feb. 25.

THE FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

Some West Virginia Game Notes.

A NEW game bill has been passed by the Legislature now in session, which does away with the unwieldy measure that the Legislature of 1897 perpetrated. That body made a close season for all the principal game animals and birds and imposed a series of fines for any infringement of the law. The effect of this was to afford a splendid opportunity for the worthless to enjoy the exclusive right of the game in the mountains, who, safe in their insolvency, were not interrupted by competitors from whom a fine could be collected. While we believe it wrong to give the aristocracy the exclusive right to hunt, it is hardly as bad as to go to the other extreme.

In the sweet simplicity of its nature, the Legislature of 1897 showed a great confidence in their system of restrictive laws and fines, for it created the office of game warden, a being entirely new to the people, the majority of us not having a clear conception of what a game warden was, and saying that his salary of \$1,200 and expenses should be paid out of fines collected from the violators of the game law. The gentleman who received the position was an engine driver who has since served as a captain in the United States Volunteers. He was compelled to report no funds.

Some practical sportsmen took the matter in charge this session and a bill has been enacted which will at least insure special privileges to none. The open season for deer is from Oct. 15 to Dec. 15; for grouse, the same; for quail, Oct. 1 to Dec. 15; wild turkeys, Sept. 15 to Dec. 15.

No game is allowed to be shipped from the State. The promoters of the bill tried hard to get the people to live up to FOREST AND STREAM's plank, "To forbid the sale of game at all seasons," but it coming before a latter-day Legislature, the majority of which show no sign of atavism in the sporting way, except an unimpaired appetite for the treasures of the wilderness, and the majority seeing that by passing such a section they would cut themselves off from all hopes of tasting game in the future, very shrewdly and unceremoniously rejected the suggestion.

There was one bluff old legislator who is enjoying a great fortune, made by his own efforts, who boldly declared that he was too old to climb mountains, who was anxious to allow deer to be chased with hounds, so that he could kill a deer once more; but there is such a prejudice against hounding, especially in non-hunting circles, that the repeal of the law against chasing was not attempted. The reason mentioned above holds good against this law, for a conviction is all but impossible, and the unscrupulous are benefited by the law.

A new feature was introduced in this bill, for West Virginia, in the section requiring all non-residents to pay a license of \$25 for the privilege of the rights of a citizen in hunting. Thus the visiting sportsman will have an opportunity of contributing for the protection of game which he will doubtless be only too glad to embrace. The bill was prepared by a very able lawyer, who consulted "Game Laws in Brief," published by the Forest and Stream Publishing Company, which is a very valuable compendium of the ideas of those who have thought upon the protection of game, as well as a useful index for the traveling hunter. The Legislature, having passed this very righteous and satisfactory measure, refused to provide for a game warden's fund, or for any bounty for the lives of those game destroyers, the meat-eating animals, the natural enemies of the game. The hawk, fox, wildcat and the rest of that guild are more destructive than man, and they do not confine their depredations to wild animals either, by any means.

It is hard to describe the feeling in this (Pocahontas) county over the late game law. The injustice of it rankled to such an extent that we were given an insight into what we might expect from the people if they were harassed in such way by laws touching more important matters. For instance, most of the farmers knew of flocks of grouse at certain places on their farms where they could have been killed as easily as barnyard fowls. They respected the law and took a pride in game like this, in which they seemed to have a proprietary interest. Then some day the farmer would hear the lively banging of a shotgun, and some loafer would carry off in full view a half a dozen pheasants right under his eyes, saying insolently, "Why, this is the best law I ever heard of!" We know this to have actually occurred more than once. We know, too, of some of this class indulging in threats of injury to be done in secret if they were proceeded against.

The feeling here was expressed by more than one: "Well, we'll wait this year to see if the Legislature will let us compete with these scoundrels in hunting, and if not we will hunt any way."

Last November one of our representative citizens (father of the young West Point honor man who died on board the transport on his way to Manila in July) was on a stand waiting for a fox. But instead of a fox a fine deer came loping by him, presenting an opportunity for a sure shot. He is an experienced hunter; but, having the proper regard for the law because it is law, he did not fire. A more sincere case of righteous indignation can hardly be imagined. His first impulse was to obey the law; on deliberation, he had a keen regret he had not shot. It is just the opposite with most hunters, and the remorse of one of the latter class would have been for breaking the law. What a marplot and spoil-sport that law for a close season the whole year around is anyway.

There was one incident connected with the pending of this bill before the Legislature which we must mention. It was pretty generally reported in the press that the hunter's license of \$25 must be paid by every one, and editorials and protests from citizens, taxpayers, voters, etc., were printed, opposing it. When these local hunters found out it was to oppose non-residents only from bearing arms they were as well pleased as they had been alarmed before. In the words of the sage, it makes a difference "whose ox is gored."

During the past fall and winter there have been some incidents connected with hunting in the county which perhaps deserve to be spread upon the record. Pocahontas is a county nearly as large as the State of Rhode Island, inhabited by about 8,000 people. It has no railroad. Its altitude varies from 2,000ft. to 4,800ft. It was once a hunter's paradise, but now only a trace of its

former bountiful supply of game remains. There have been too many rifles and dead shots in the county. The kind of men who hunted here were those who shot squirrels in the head, not from any special pride in their marksmanship, but because that is the proper place to shoot a squirrel. It was no unusual thing for a turkey to be killed on the wing, and recently one good shot with a rifle killed a duck flying over the river. I have known hunters here who shoot a rifle and kill deer and other game who are not able to remember that they had looked through the sights. They point a rifle barrel intuitively, as a man points his finger.

The best luck of the season came to Neal Hammond, one of the Hammondses of Big Run, who are all great hunters. In November in a light tracking snow he came on three bears, two male and a female, and killed them all with a shot apiece. They were all large bears, and the most remarkable thing connected with the occurrence was that it was rutting time with them, something unusual, as August is their usual season. The bears lay dead within a rod of each other. The hunter found he had taken a step between each shot.

There is a set of deer horns on Elk, off of a deer recently killed, which make it very clear that there is a mystery connected with them. The bend of the horns is so great that two large men can stand inside of them. It is whispered that these horns are all that remains of a notable deer, which inhabited the Gauley country, the size of which and opportunity proving too much for the probity of the born hunter.

Every hunter knows, that in spite of the fact that deer are so wild, after many years, an old buck will become well known among the men who sink themselves in the woods. He registers himself in his big hoof, and he is known as belonging to a certain section. An unusually large or peculiar head of horns may also have identified him. One of the biggest of its kind has been known in Buckley Mountain for years, whose distinguishing mark is a crooked foot. There was such a deer on the head of Hill's Creek who was known among the hunters as Old Sam—a very large deer, with the biggest head of horns that ever was seen. The remains of this big deer were found by bear hunters in December. How he had come to his death will probably never be known. A chance bullet may have killed him, or he may simply have paid the debt of nature, the last enemy of all, which the game protector considers. The bears had eaten the carcass, but the horns were saved, and brought away together with a hoof, which could have belonged to no other. The antlers have eight points to the beam. Old Sam may have borne a charmed life and been destined to die of good old age.

Under the existing law, there would naturally be but few deer stories going the rounds. It is one of the phases of the lawbreaker's retribution that he cannot boast of his exploits.

They say that a couple of hounds passed through the Downey Hacking after a fox the other day, both hounds and fox going at a snail's pace and unable to increase or diminish the distance between them; that a very voracious man saw a fox which the hounds were pressing reasonably hard stop to catch and eat a mouse, which confirmed him in the belief that a fox often enjoys a run with the hounds; also that a panther's track has been seen during the late snow on William's River.

A black fox was killed by Levi Beverage, on Clover Creek, the first one to be seen here in many years. Our "black fox" was once very plentiful here. It is about the size of a house cat, and has the habits of a squirrel. Its fur is very valuable.

William Kelley, a great hunter, raised seven foxes in 1897, and six in 1898, and marketed their pelts. He is sixty years old, and during his long and active life has gotten much sport that was lasting and good out of a gun. His word can be relied on implicitly, and his reputation for truth was needed when he found a red fox asleep and killed it with his cane. The circumstances as related by him are as follows: "In December he was walking on his farm and had occasion to pass through a piece of ground lately denuded of its trees by the lumberman. There in the sawed-off stump of a tree he saw a fox lying asleep, with his head resting on his paws. Having observed the animal for a few moments, he started to creep up to it, and succeeded so well that the fox did not rouse until the blow was descending. The first blow knocked the half-risen fox back, and a second swiftly following, killed it. It was an unusually large fox."

The writer realizes that such instances are nothing if not true, and would not report them as true unless he were in a position to judge.

The following, told for the truth, had better be taken "with a large grain of cayenne pepper." The fox hunter says recently he was running to head off a fox from turning toward his den, on a fearfully steep mountain side. His foot caught on a stick concealed in the snow, and he went flying through the air, down the mountain, and landing near the fox reached out and caught it. During the same conversation he remarked casually that he believed that a man could tell a lie until he came to believe it. It was thought that this had some remote connection with the tale of the fox.

Two wonderful birds were seen in Gauley Mountain this winter. Such astonishing birds have not been seen here since George P. Moore imported a couple of fine peacocks, and had them shot by his nearest neighbor, who took them for some unknown game bird. The birds in Gauley Mountain were a pair of Mongolian pheasants, which were liberated by the Cheat Mountain Sportsmen's Association last spring. Probably the most interesting feature of their discovery in Gauley Mountain is the proof the incident affords that this bird will not confine itself to any special locality when liberated. They were released in the Cheat Mountain country and were seen in the Gauley Mountain region, more than twenty miles away. The two mountains are separated by a strip of farming country, and at no point are they connected by the forest. So these birds must have left all cover to have transferred themselves to a section not more wild, but of a different character. The surveyor who saw them had seen the birds while they were confined at the club house, and so recognized them at once. He informs me that the Association was not successful in rearing them in captivity, owing to disease, to which they seemed particularly susceptible, and to the depre-

dations of a mink. Last spring some seven or eight were released and have not been seen since by the gamekeeper. The members of that Association will be glad to see, no doubt, in the FOREST AND STREAM that two of the birds were in good condition in December, even though they have gone further afield than was intended. When the surveying party came up the pheasants rose from a laurel patch and perched on the limb of a tree until the men came nearer, when they gracefully sailed away.

Our associations class the turkey buzzard as rather gamy than game; but the nest of one was discovered and watched last year on the top of Marlin's Mountain. The finding of this nest was considered very remarkable, as those who were interested in the incident had never known of another nest being found. It was discovered early in the summer by a surveying party. Those who have followed the chain in the woods know that after the surveyor with his magical compass decides on a course meant to be N. 23 E., and 999 poles long, or something like it, and works his men through the right distance there comes a great overhauling time to find the particular tree which bears the marks of the "broad arrow," or, as we know it, the marks of the three indistinct strokes given by a surveyor may be fifty years ago. The surveyor and all the men scatter over an ever-increasing circle, looking for the tree, and lucky it is if the surveyor has guessed the right mountain the tree is on, or come within reaching distance of it.

It was while engaged in looking for the broad arrows which marked the corner tree "witnessed" by a "cliff of rocks" that the party found the buzzard's nest. The rocks were high and dangerous, and topped the summit of a very precipitous mountain side. It was such a place as the third-rate imagination would find joy in calling Eagle's Height, Hawk's Nest, Lover's Leap, or something of that sort.

While examining the chestnut oaks on the summit, a buzzard flew out from under the cliff and directed the attention of the party to the place of her nest. About 8ft. from the top, in a crevice, sheltered by overhanging rock, in a situation to make the best climber dizzy, was the nest. No preparation had been made by the bird to improve the place she laid her eggs. There were two eggs there, which in size about equaled a turkey egg, and which were marked by red spots, such as you see in the countenance of your billious friend. A few weeks afterward, the nest being revisited, two young birds were found in the nest, which had attained the size of a small duck. They were as white as the driven snow (why driven?) and had black beaks. They stood upright, and looked at the intruders, while their frantic mother hovered near. Then one of the young ones stretched its neck a great ways out and gave a hissing sound. The powerful stench that rose to place from which they were being observed drove the sightseers away. This smell is not remarkable when you remember that the mother feeds her young by disgorging carrion. A few weeks ago a sheep was found near this cliff lying helpless from the effects of laurel, which it had eaten. The buzzards had picked its eyes out, but it afterward recovered.

ANDREW PRICE.

MARLINTON, W. Va.

In the Days of Pigeons.

THOSE glorious, "palmy days" were away back in the '50s. They were indeed palmy days, for not alone were there myriads of those beautiful birds, which our esteemed friend old Noah Webster defined as gallinaceous and belonging to the genus *Columba* or migratory pigeons of North America, but every other species of the game birds which once made Michigan the delight of naturalists as well as the lovers of those life-giving sports afield with dog and gun. What reader of FOREST AND STREAM who loves the woods and fields, and whose happy lot it was to have lived in those bygone days, has not embalmed in fond memory experiences which will continue to brighten his life until the end?

But the beautiful pigeons are gone. When one has eaten the strawberries of Switzerland, those famed strawberries which are tempting and beautiful in appearance, and remembers the luscious fruit of Michigan, he will have something of the sensations which the sportsman of to-day experiences when he looks back upon the halcyon days "when we were young." They have a name to live and are dead—those "Alpine strawberries," which have such a fine sound to the ear, but we who know would give a bushel of them for one saucer of that delicious fruit that grows nowhere else in such perfection as in the old Peninsular State.

So with the quail, grouse and woodcock; we have now such birds, it is true. I have had on my table within the week Texas quail and ptarmigan, the white grouse of the West, but they were not the birds we had here in the "oak openings" and the clearings in "the days of the pigeons." I well remember one notable day in September, in Monroe county, spent in the woods and fields along the River Raisin. A friend with the "unquenchable yearning" to get away from the exasperating cares of business fell upon me in a mood when I only lacked a companion to start out, in pure desperation. A smart bay was duly put into the shafts of a suitable vehicle, guns, ammunition and other necessities were loaded into the commodious receptacle "for such purposes made and provided," and we were fairly on our way, with something of the same sensations possibly that sweeps over a caged bird when liberated from captivity. The morning was a charming one, and "all nature smiled." It was not necessary in those days to make a very lengthy pilgrimage to find sport to our hearts' content. Five miles along the banks of that winding stream, over and through a country which had been the home of the Pottawattomies and Shawnees, the first landing places in the New France by LaSalle Cadillac and Father Henepin, who, as they paddled up this beautiful stream two hundred years before, had found it "entrancingly beautiful" and abounding in game and fish of the rarest beauty and delicious flavor. The banks of the stream, as these intrepid voyageurs and explorers found them, were luxuriant with the wild grape, the exquisite Michigan rose, and the fruits which grew

in their "native luxuriance, and of surpassing flavor" as they described them. It was then a hunter's elysium. We soon arrived at the point originally selected as our destination and found hospitable quarters for man and beast. We lost no time in getting into the fields, and most promising stubble of oats and wheat and buckwheat ranged back from the bottom lands of the river on either side of the road. Those were before the days of hammerless or any kind of breechloaders—our shot pouches and powder flasks were hung from our shoulders, with a few Ely's cartridges in our pockets, a provision against the appearance of some presumptuous turkey that might rashly cross our path. The dog, who made up the trio on this occasion, was my spaniel Dan, the incarnation of intelligence, obedience and fun. That dog was simply a wonder; what he didn't know about matters and things in general, and things that came up unexpectedly to be passed upon off-hand, it would be of no earthly use for any dog to fool away any time upon. I sometimes used to think it was a pity he couldn't talk, so that he could give us chaps valuable pointers, but on the whole it was perhaps just as well, for as a general thing, when one knows so awfully much the temptation to talk too much leads to difficulties.

I don't want to devote too great space to what occurred during the forenoon, the things that happened to the quail and partridges and the woodcock. What I started out to chronicle is in relation to pigeons, as may be imagined from the caption of this letter. But I cannot refrain from spending just a few moments with those darling Bob Whites and the charming grouse that eventually found their way to our game bags—fat, lusty fellows, who, from long weeks of absolute freedom from molestation by the "city fellers" and the farmers' boys, had become too confiding in their sense of security for their own good.

And yet there would not be so very much to relate. Dan did his duty, and we tried to do ours—the game bags told the rest. After a good substantial dinner at our host's, the hospitable farmer, whose skill as a provider was amply demonstrated, no less than the accomplishments of the buxom damsel who prepared the meal. That quail pie looms up in beauty amid the thousand memories of good things to this day. My dear old FOREST AND STREAM reader, was it ever your good fortune to be seated before a dish of that name? I don't mean a restaurant game pie, with unknown contents inclosed in pastry that makes dyspepsia and ugly dreams—but a beautiful thing that only comes of a refined taste, a calm and unerring judgment and a general supreme "know how." This one was a dream, yea, better than a thousand dreams—it was a blissful reality. Think of a dozen fat, juicy quail, a few slices of home-cured pork, a couple of woodcock, a rich, creamy, flaky crust baked to a golden brown, seasoned to the point of perfect assimilation, flanked on one side by a crisp lettuce salad and on the other by the first rosy plump tomatoes from the well-kept garden! Golden butter melting on snowy light raised biscuit—heavens! is this cooking a lost art?

Now to the pigeons, but don't make an unreasonable and fatal mistake by supposing that we were able to undertake any sort of exercise for an hour or two.

That would be too much to expect—far too much from us in our then condition. Stretched out underneath the spreading branches of a giant oak on the smooth turf which had just begun to receive the crimson and gold decorations from the leaves which Jack Frost had already begun to scatter about in these early days of autumn, our pipes sending upward the curling columns of smoke, Dan at our feet calmly dozing, and the soft ripple of the distant river making soothing music, is it a wonder that we fell into that delightful mood which inspires the one wish, to be undisturbed? The hysterical notes of the bluejay away up in the topmost branches, the scampering here and there of the chipmunk, the timid investigations of a gray squirrel, the comical performances of a red-headed woodpecker, none of these were intrusive, they were the consistent factors of a place which would have been incomplete without them. However, we couldn't stay there forever, no matter how great the effort required to break away. Toward 3 o'clock we were approaching a large field which had been "sown to wheat," as the farmer said; it contained perhaps twenty acres or more, and was bordered on two sides by heavy timber—the primeval forest. About thirty rods from the west side in the open field stood a dead tree, a gigantic oak, with not a leaf upon its outstretching branches. It was the skeleton of a monarch. The sun was hot, and the shade of the woods on the west offered us a grateful shelter from the heat, and here we two seated ourselves to rest from the two hours' tramp after dinner. Within twenty minutes from the time of seating ourselves, small flocks of pigeons began to appear and settle down upon the wheat field, to feed upon the new-sown grain. Presently larger flocks arrived and more frequently. From bunches of twenty their numbers increased to fifty and a hundred. New arrivals would now alight in the branches of the dead tree, and whenever a noise would disturb those in the field hundreds would rise into the tree above them. Thicker and thicker came the pigeons, and the noise of their wings and chattering was almost a roar. It was a most exciting and novel scene to us, as we sat there in the shade and watched the unsuspecting birds.

But human nature could not stand that sort of thing very long, and especially human nature at the age of twenty-five, with two loaded shotguns in their hands.

"Say, Buck, how long are we going to sit here like bumps on a log? I'm going to have some fun." Thus said my chum, and proceeded to carry his sentiment into practical and tangible form. Without rising, he brought his double-barreled muzzleloader, 10-gauge, to his shoulder and let go both barrels into the tree. At that time, although there was not a leaf there, the tree had the appearance of being densely loaded with foliage, and every leaf was a live pigeon. I followed suit with mine and dozens fell to the ground. The remaining birds rose from the tree in a great cloud, and after circling around for a few moments again alighted upon the branches, accompanied by as many from the ranks of newcomers as could find a resting place. We rapidly reloaded our guns, and the second time blazed away. I

don't know how many birds were killed at each discharge, but if there were a hundred it made no apparent difference in the remaining hordes. After each volley the birds would nearly all rise into the air in a dense mass, only to return in five minutes or less to the tree and the field. We never moved a foot from our point of vantage, nor allowed Dan to retrieve a bird for an hour and a half. At the end of that time we had driven the birds from the field and saved our lost twenty acres of newly sown wheat.

We occasionally took a wing shot as the pigeons flew over our heads or on either side of us, and this relieved the monotony of the continuous fusillade. When our ammunition was exhausted and our heads ached as they never had before, nor have since, from the recoil of the befouled guns, nor went over to the old dead tree to pick up the victims of the slaughter, for it was nothing else, and it was a sight to behold! The ground was literally covered with dead pigeons, and mighty few wounded ones, I was glad to see. Well, we brought over the farmer to see the field, and if there ever was an astonished and grateful man he was the chap.

"Why, boys, ye've saved my wheat, as sure's shootin'; them pigeons would jest nachally eat up every grain of that wheat in the hull twenty acres, and I do' know how I'm goin' to make it right with ye, I don't for sartain."

"Well, Mr. Talford, just take some of these pigeons off our hands and we'll call it square."

"Wall, I swan, it beats the evilastin' thunderation; I'd never dreamed on't. Now, what you boys do, you come out here, say, in November or October, when I can take a leetle time to it, when fall work's over, and I'll try to give ye a leetle mite of a good hunt, if that's what you like, eh?"

"All right, and thanks, Mr. Talford. We'll accept the invitation, and now we must start homeward."

We loaded 364 elegant fat pigeons, 27 partridges and 17 quail into one roomy buggy and started for home. If it wasn't for that beastly headache we'd have been two of the proudest and happiest young chaps in Monroe county; and as it was, when we drove through the main street of the town just about sundown, with that pile of game (disposed so as to show to the greatest advantage of course), we weighed about 240z. to the pound, and were bigger lions than Barnum had in his menagerie, which exhibited in town the next day.

DETROIT, 1899.

CHICAGO AND THE WEST.

Elk Slaughter in Wyoming.

I am in receipt of the following communication from Mr. Edwin F. Daniels, long president of the Tolleston Club, of this city, and a sportsman of the best sort. He writes:

"I took a trip to the Rocky Mountains last fall, and was very much interested in what I saw while there. We got into the mountains about Sept. 1, and our party had fairly good luck. We got enough elk to keep the camp supplied with meat, and I believe that is all we ought to have had, although I would like to have gotten a head for my home. One week longer would have given us this opportunity, for just as we were coming out, we saw several heads that had just been brought in.

"My object in writing this to you, however, is not to describe the trip, but to tell you a few facts about hunting parties that were in the mountains after we left. Two of the parties, which I understand were composed of four or five members each, were connected with two of the wealthiest families in New York, and another party was, I believe, from Boston. These three parties, I have been told, were there during the last part of September, and up to the middle, or a little later, of October, and were hunting almost every day during that time. The game was more abundant than it had been for a long time; it was no uncommon thing to see bands of several hundred elk—in fact they could be found any day when the hunters chose to go after them. From what I have learned, I have no doubt that in the four weeks, or thereabouts, that these parties were in the mountains, they killed more than 150 elk. I believe they took back not over twenty-five heads, leaving the balance, or probably more than 125, that were simply shot recklessly and wantonly, and without any object whatever, except it might be perhaps to get their teeth. For the most part, the skins were not even taken off them; they were left in their tracks as they were shot, with simply the teeth knocked out.

"The same spirit of slaughter is perhaps intensified in the case of the residents of that section. It has been brought to my notice in two particular instances, of men who live there, who make it a business to go out and kill all the elk they can for the purpose of getting the heads, hides and teeth. These people, however, have always lived in the midst of this game, and do not realize the importance of preserving it, and they are much more excusable than Eastern people—educated and with a knowledge of what will be the result if game is allowed to be slaughtered in this way. What I wonder about is, what the game wardens and State officers are thinking of to allow it. I know from experience that the soldiers in Yellowstone Park are doing a good work in protecting game in the open season. I do not know as there is any restriction in the amount of game a man or a party can kill in Wyoming; they take out a State license, and I presume are privileged to go and shoot elk in unlimited quantities, as the circumstances, and their inclination may be.

"I believe that the FOREST AND STREAM is more influential, and is making a stronger and better fight for the preservation of game than any other publication or any association. Cannot the FOREST AND STREAM take up this matter, and send copies of editorial protests to the right parties, so that the people can be awakened to the magnitude of the slaughter, and the importance of putting a curb on it? There is no reason why a sportsman who goes into that country, even if he has a game license, should be allowed to kill more than a certain number of elk, which may be determined by the circumstances, and by the taste and judgment of those that are best qualified to pass upon these points. There certainly ought to be in

every license, it seems to me, a restriction as to the number of animals the hunter shall kill.

"The trip I made last fall was the first one I ever made in the Rocky Mountains, and I was delighted with it, and I have been more interested than ever before in this matter of the protection of the big game since I returned. I have gotten my information from every source where I could get it, and believe that it is absolutely reliable."

This slaughter of elk by non-residents is something which is going on and has been going on steadily for a long time, though it is something which is not known to the public, and which never would be known were it not for the sporting papers and for such gentlemen as Mr. Daniels, who do not hesitate to make known and to condemn such acts. It seems almost past belief that men claiming to be decent would in these days care to go into the mountains and assist in the killing of over 100 great animals like the elk. Yet what can be done? The mountains are big and the wardens are few. For my own part, I believe in mountain law. I believe that the ranchmen and residents of that big game country should take these matters into their own hands, and should warn all such non-resident butchers to leave the country, and to leave at once, never to come back. I have seen this sort of law put into effect, and you never did see any other kind of law which worked quite as quickly, smoothly and thoroughly. I never could really blame a poor man who lived in a game country for killing meat when he actually needed it, and I do not think that game laws ought to be made for the benefit of sportsmen, but for the benefit of the people. A sportsman is no better than any other man, and if he classifies under the description of these elk butchers who went into Wyoming, he may be worse than any other sort of man, and worse than a market hunter. The laws of older days come into effect when the population becomes numerous and centralized. Until that time has arrived, the laws of the old West whose spark still remains in some of the corners of the Rockies, ought to prevail, laws which were founded on justice and fair play, and laws whose executive arm had nothing of the pitiable weakness known to the statutes of our so-called civilization. If the men of the elk country wish to stop this butchery, let them stop it. Then it will be really stopped.

Arkansas Game.

Mr. Jos. Irwin writes me from Little Rock, Ark., this week, stating that ducks are now coming in on the corn-fields in large numbers. The lakes and slashes are still full of ice, so the birds are going to the river at night. Mr. Irwin says that the cold weather only lasted for a few days in his vicinity, so that the quails are not very badly damaged. In this respect Arkansas is luckier than the Northern country, where all reports seem to indicate that the quail crop has suffered very seriously by reason of the extremely severe weather.

Wisconsin Game.

Mr. George A. Morrison, of Fox Lake, Wis., is so good as to send me the following notice about game matters in his State. I am glad to see that there is sentiment in favor of stopping spring shooting, though I fear it may not result in an actual law to that effect. The sportsmen's bill at the Legislature of Wisconsin this winter is being met by many others far less thoughtful and less modern, and it is not known what the result will be. Mr. Morrison says:

"A friend of mine, Mr. J. Hoffman, just returned from near Kilburn reports having seen a good bunch of quail Feb. 13. He had counted forty when they began to mix up, but he says there were at least sixty in the covey. They approached within 20ft. of them. While at Pardeeville last week I was told by a gentleman that he saw a small covey along the roadside while driving. Small bunches have been seen about the country adjacent to this town during the past two years, and also about Waupun, ten miles east of this place. This all goes to show what can be done if game is protected. The coveys seen about here and at Waupun are undoubtedly offspring of some few pairs released at Fon du Lac some seasons ago. This winter has been very favorable for quail and chickens in this section, little snow having fallen, and the ground now is entirely bare, so what few we have ought to pull through.

"The sentiment among sportsmen here is to stop spring shooting; this feeling has been growing for nearly two years. At that time a petition was circulated by a leading sportsman and signed by a large number of local shooters, petitioning the Legislature, then in session, not to abolish spring shooting. There is not a man of them that would sign that paper to-day. The heaven is also working regarding the sale of game. It must be stopped if the game is to be saved."

In Arizona.

Mr. E. E. Bliss, of Saginaw, Mich., who is now at Phoenix, Ariz., and enjoying the splendid winter climate of that region, sends me some notes in regard to valley quail shooting in Arizona. He says that his first experience was with Messrs. Pickerel, Walker and McCowen, residents used to the game, who took out himself and Mr. Vincent, both from Michigan.

"Mr. Vincent is a business associate of the Mr. Briggs you know, of Saginaw," Mr. Bliss says, "and he does not claim much experience as a hunter; but under Mr. Briggs' direction purchased an outfit before coming here. In reply to my question as to how it happened that Mr. Briggs had never taken him on some of his hunts, he said: 'Mr. Briggs did invite me once, and only once. Soon after we began our hunt our (borrowed) dog pointed, and in my hurry I stubbed my toe. The dog lived, but I never got another invitation to go shooting.' So much for an open confession.

"Our drive of fifteen or sixteen miles over smooth roads, past almond orchards, orange groves, etc., out into the unimproved desert, was no small part of our pleasure. We found the birds where the brush was thickest, as it was after morning feed time. The sport was lively for a time, and then our lunch was eaten in the shade of the buckboard and buggy at a Government well some 15 or 20ft. deep. After a rest, more quails, and then home with some fifty-odd birds, with which bag we Michigan men were well pleased, though the others had expected more. As you know, they use no bird dogs

after these Arizona trotters, but some of the things looked for in a good dog are also, it seems to me, good things for the hunter to possess, such as range, speed and bottom. The flight of the birds is similar to our Bob White's. The footing is good, and the shooting open, but the hurry necessary keeps the percentage of misses about the same.

"I found that too in an open barrel gave about the same results as the other got with coarser shot and choke guns. Would want more experience before choosing between the two. Light flannel underwear and shirt, broad hat, skeleton coat, canvas pants and leggins, with good tan shoes, not 'made in Germany,' would be a good rig here.

"I expected to go out with Dr. Jessop yesterday, to be gone until Monday, after ducks and quails, but the man who was to show us the way could not go till next Sunday, so it is postponed a week."

E. HOUGH.

1200 BOYCE BUILDING, Chicago, Ill.

The Queer Things that Happen.

Boston, Feb. 27.—Hunting coons with an axe is not the usual way, but a Chesterville, Me., farmer has lately made a success in that direction. According to Bangor dispatches to the Boston papers, George W. Brown, of Chesterville, in search of dry wood the other day, felled a big pine stub. Cutting into it he felt his axe strike something soft, and thinking that it might be game of some sort—possibly a bear—he split the stub open with wedges. In the cavity were eight fat coons, snugly housed for winter. Further up the stub were two more coons. Brown got, besides his dry wood, nearly 200 lbs. of coons. These he was not long in sending to Bangor, and some of them have reached Boston; judging from the fact that several have been seen in the markets here, at a season when not expected. It is also reported that Jack Haley, a woodsman of Jackmantown, Me., felled a spruce the other day, which struck a big dead pine, uprooting it. Under the roots of the pine lay a big black bear; rather sleepy at first, but ready to fight when approached. Haley easily dispatched him with his axe, however. This prize also found its way to the city, netting Haley about \$25, the skin being in prime order. Eight saddles of deer came from Maine the other day into the Boston market. They were shipped by the regular underground method, which is yet about as mysterious as it is crooked. But the Maine commissioners have been notified, and the shippers will be brought to grief, if possible. The commission house selling the saddles here did not receive them from the Maine shippers, but took them to sell for a house in the Big Market. This house did not receive them from Maine, but took them to sell for those who did receive them—not in the market business. This is as far as information on the subject is obtainable.

No changes of any consequence have yet been made in the Maine fish and game laws. The petitioners asking that the number of pounds of trout and landlocked salmon one may take be reduced from 25 to 15, have been given leave to withdraw; also the petition proposing to change the open time on deer from Oct. 1 to Jan. 1, as now, to Sept. 15 to Dec. 15, has been treated in like manner. It is possible that the general bill the commissioners propose later in the session, may include some of the changes, but the temper of the committee seems to lean toward letting the present laws alone as much as possible.

SPECIAL.

New Hampshire Fish and Game.

HUDSON, N. H., Feb. 25.—*Editor Forest and Stream:* I write to inform you briefly of some of the changes made in our code of fish and game laws during the present session. These changes have passed both House and Senate and await the Governor's signature. The open season on brook trout in Coos, Grafton and Carroll counties commences May 1, and ends September 15. In all other counties in the State the open season commences April 1 and ends August 1. The length on lobsters was raised from 10 to 10½ in., to conform with the Maine and Massachusetts laws. Appropriations have been granted for the screening of the outlets of several lakes. The open season on grouse, quail and woodcock commences Sept. 15 and ends Dec. 15.

Previous to this the open season extended to January 1. A bill has passed the House, with a fair show of passing the Senate, against any person hunting game birds for a whole or a part of the time with intent to trade or sell, or against any person exposing for sale, or having in his possession for sale. Penalty not less than \$40 nor more than \$200.

Deer are becoming very plenty all over our State. We have been much troubled to get convictions against dogs or dog owners for running down and killing deer. Four have been killed by dogs in the southern part of the State within the last two weeks. The law has been so amended that any person can kill a dog when running a deer. Besides this, a bill has passed both branches that reads like this: "Any owner of a dog to whom notice has been given that such dog, when at large, has been discovered pursuing or harassing moose, caribou, deer, or sheep, or injuring any creature, wild or domestic, shall be fined \$5 for the second and each subsequent occasion on which said dog shall be so discovered; and if any dog, at any time, shall maim, injure or destroy any of the animals protected by this act, the owner shall be fined, in the case of a wild animal, the same amount which the statutes impose upon a person killing the same animals contrary to law (which would be \$100 and costs). In the case of sheep an amount double the value of the sheep. All protection has been taken from the muskrat. But two deer are allowed to a person, to be killed in the open season, and no person or corporation shall transport any parts thereof, unless open to view, tagged and plainly labelled, with the name of the actual owner, and accompanied by him. Penalty \$50."

The usual bills have been introduced allowing parties to snare on their own land; also a bill allowing land owners to kill partridge while budding. Both measures were promptly killed. Much credit is due Mr. Battles, chairman of the fish and game committee of the House, and his committee for the able way they have handled all fish and game legislation that has come before them.

N. WENTWORTH.

An Association Project.

RYE, N. Y., Feb. 23.—*Editor Forest and Stream:* I take the liberty of sending to you an outline of an association which I hope will meet the approval of many sportsmen. I trust you will give it space in the columns of your valuable paper. It is understood that the State game warden is a paid official, therefore I will not again refer to this particular officer.

Now then I suggest that a society of 100,000 members be organized in the interest and for the benefit of sportsmen; each member to pay annual dues to the amount of \$2. There are about sixty counties in the State of New York, and my idea is to have three game wardens appointed for each county, one chief and two deputies, each officer under a salary.

As three are considered a crowd, and if they are the right kind of men, with the proper quality of sand in them, there will be sufficient police force to patrol the State, and the illegal shooter and snarer of birds will go out of business forthwith.

Each county should be divided into three districts, a warden to reside in the district under his supervision; the organization to be under control of a board of managers; the president, secretary, and collector to receive compensation for their services, their combined salaries not to exceed \$5,000 per annum.

The game wardens to be under bond to the society not to kill or capture any game birds or game of any kind in the State; to employ the market-hunters as wardens.

Receipts from dues, 100,000 members at \$2.....	\$200,000.00
Disbursements:	
60 chief game wardens, at \$800 per annum.....	\$48,000.00
120 deputy game wardens, at \$500 per annum.....	60,000.00
Officers' salaries	5,000.00
Legal expenses	5,000.00
Office rent and other expenses.....	5,000.00
	\$123,000.00

Balance on hand.....\$77,000.00

From the balance of the funds in the treasury a large portion of the same could be used in restocking our depleted covers each year with game birds. I believe there would be very little difficulty in organizing an association on these lines, or a consolidation of the gun clubs and associations now in existence would do the business. The very modest sum of \$2 per annum would without doubt be paid most cheerfully by most persons who delight to be afield with dog and gun, enjoying the balmy breezes with the assurance of again finding birds in the old familiar places.

If any brother sportsman has anything better to offer in this line, I should be pleased to see it in print.

G. W. GALLAWAY.

What about This?

WORCESTER, Mass., Feb. 23.—*Editor Forest and Stream:* The Worcester Game Protective Association was the name adopted by a number of gentlemen who last year met and organized an association for the propagation and protection of game birds in Worcester county. At the annual meeting, Feb. 15, the treasurer's report showed that since the organization was formed the receipts have been \$1,166, and expenditures \$800. The secretary's report showed that during the past year the Association imported from New York State and the West and released in the vicinity of Worcester 1,200 quail.

What has been the result of this addition of 600 pairs of birds to our game supply? From personal observation your correspondent is of the opinion that the imported birds did not breed or remain in this section, and this opinion is voiced by many other shooters. During the summer the birds were very much in evidence, and they could be heard whistling in the fields, no matter in what direction one would go into the country. But when the season opened, Oct. 15, the birds seemed to have disappeared and quail were not found any more plentiful hereabouts than during the previous season—the supposition being that the imported birds not finding as good feeding ground here as in their native State had in all probability gone into Connecticut or elsewhere. Worcester county feeding ground for ruffed grouse is unsurpassed anywhere, but it is by no means an ideal locality for quail.

But if the imported birds had remained and bred well we think the money invested would not have justified the expenditure under existing conditions—that is, so far as benefiting sportsmen at large is concerned—and why? Because there are gentlemen actively associated with some of the so-called game protective organizations hereabouts who make a business each season of killing birds for the market. And it is a notorious fact and cannot be refuted that as many as 300 or more grouse, woodcock and quail fall to the gun of each of a number of such local sportsmen(?) during the open season of every year, and are sold. We have the papers! Is this the way to protect and increase our game birds? We admit the difficulty of successful legislation in the premises, but all sportsmen, members of game protective associations or not, ought most emphatically to denounce and discourage any such mercenary business as pot-hunting, much less to "set the pace."

There is no law to regulate the killing of foxes, but there is an unwritten law among the members of the Worcester Fur Club that during certain months of the year reynard shall be safe from honorable pursuit. With this club *Consuetudo pro lege servatur*. And why not then without legislative enactment desist from pot-hunting before our covers are entirely depleted? The man who will refrain from snaring a grouse or from shooting one between Dec. 31 and Sept. 15, because it is in violation of law to do so, but who will cover from five to twenty-five miles of territory every day that he can possibly get into the brush during the open season and work as hard as he can to outshoot every competitor in this nefarious business is not worthy the name of a sportsman, and ought not to be received into membership of any club, the aim and object of which is the protection of game.

BOB WHITE.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

The Weather and the Birds.

MADISONVILLE, Ky., Feb. 19.—*Editor Forest and Stream:* During and since the recent cold spell I have been making a business trip through western Kentucky, and in all of the towns visited, I made inquiry of the country people who were found in town, regarding the quail and other birds. Many of the people interviewed said they had found "bunches" of quail frozen to death on the roost, and the opinion is unanimous that all quail that did not take shelter in barns, or come to where live stock or poultry was being fed, had "shone perished." Several farmers said that quail had come boldly to the stock yards and poultry yards. It appears that in most instances the birds were kindly cared for, when they threw themselves on the mercy of the farmers, though one fellow said a "mighty big flock" came to feed with his chickens, and he "done trapped every one of 'em." The farmers also report finding many dead, meadow larks and some bluebirds. Numbers of chickens and guineas perished, and ducks' feet froze fast to the icy ground. There was a vast amount of suffering among the people and all kinds of domestic animals.

From all over the South comes the same report about the birds. Quail shooting in the South, and probably in the North, too, is a thing of the past, and it will take years of careful protection to repair the devastation.

O. H. HAMPTON.

BREWER, Me.—*Editor Forest and Stream:* I have just received a letter from A. T. Wayne, a somewhat widely known ornithologist, dated Mount Pleasant, South Carolina, Feb. 20, an extract from which may be of interest to some of your readers. He writes:

"We have just passed through the coldest weather ever known for 200 years. Last Tuesday the thermometer marked 5 degrees above zero, with snow 4 to 5 in. deep on a level on the ground. The mortality among birds was appalling. Millions of fox sparrows and snowbirds perished. Thousands of grass finches, chipping sparrows, savanna sparrows, bluebirds, pine warblers, blue-headed vireos, doves, killdeer, larks and hermit thrushes, and countless thousands of woodcock were killed by would-be sportsmen, or else frozen to death. I never saw such annihilation of life before, and hope I shall never again witness such a scene. Horses, cows, mules and other animals were frozen to death. Many people also were frozen to death. It will take twenty years for these birds to establish themselves under its most formidable conditions."

M. HARDY.

HAMILTON, N. C. Feb. 19.—Snow is about gone. Quail fared well. None found frozen. Shooting fine here.

OLD LEGGINGS.

Congress and the Birds.

WASHINGTON, Feb. 25.—*Editor Forest and Stream:* In the Senate to-day, Mr. Hoar announced that the conference committees of the House and Senate on the disagreeing votes of the two Houses, on the Lacey game bird bill, had been unable to agree. He stated that both Houses had agreed to a provision which nobody, not even the mover of it, desired to have retained. So he moved to reconsider the vote by which the bill was passed, and asked that a message be sent to the House of Representatives, requesting the return of the bill. Then the following proceedings occurred with reference to it:

MR. HOAR.—I now move to amend the House bill by striking out all after the enacting clause and substituting what was added as new sections by the Senate to the bill. It is not necessary that the sections shall be again read, as they have been read.

MR. COCKRELL.—What is the pending measure?

MR. HOAR.—The bill in relation to birds.

MR. COCKRELL.—That is enough.

MR. HOAR.—That is the whole story. It is not necessary, I suppose, to make any explanation.

THE VICE-PRESIDENT.—Will the Senator indicate to the Secretary what are the amendments he desires to have adopted?

MR. HOAR.—We have just reconsidered the vote by which the Senate added certain sections to the bill. I now move that instead of adding those to the bill as it originally came from the House, to strike out all after the enacting clause and insert those sections as a substitute for the House bill. It is not necessary that they should be read.

MR. CHILTON.—What is the bill as to which the Senator proposes to strike out all after the enacting clause?

MR. HOAR.—I was about to make a statement, but the Senator from Missouri [Mr. Cockrell] did not think it necessary. It is the bill for the protection of birds. The House sent over a bill to give jurisdiction over that subject to the Fish Commission. The bill was amended in the Senate by adding other sections for the protection of song birds, and so on, which were passed unanimously. Then the matter went into conference. Now, everybody is satisfied that it was a mistake to give that jurisdiction to the Fish Commission. But as the bill now stands it is not in the power of the conferees to withdraw it, because both Houses have agreed to it. The bill has now come back to the Senate, and the Senate has reconsidered its previous action. I now propose to make what the Senate heretofore passed a substitute for the House bill.

MR. CHILTON.—That is the way the bill was before?

MR. HOAR.—Yes; that is the way it was before. All the conferees agree to it. After my motion has been agreed to, I shall then ask for a new conference and the whole matter will open.

THE VICE-PRESIDENT.—The question is on the amendment submitted by the Senator from Massachusetts to strike out all after the enacting clause of the bill and insert what he has indicated.

The amendment was agreed to.

The bill was reported to the Senate as amended, and the amendment was concurred in.

The amendment was ordered to be engrossed and the bill was read a third time.

The bill was read the third time and passed.

MR. HOAR.—I now move that the Senate ask for a

committee of conference with the House of Representatives on the bill and amendment.

The motion was agreed to.

By unanimous consent, the Vice-President was authorized to appoint the conferees on the part of the Senate; and Mr. Hoar, Mr. Teller and Mr. Bacon were appointed.

It is likely that a compromise measure will be arranged during the remaining week of the session, but probably will be very materially modified.

The Senate also passed the bill (H. R. 2524) for the protection of birds, preservation of game, and for the prevention of its sale during certain closed seasons in the District of Columbia, which bill passed the House of Representatives during the long session of this Congress, more than a year ago.

There are some slight modifications of the House bill, which will undoubtedly be agreed to, and the bill in its completed form, as it will become a law, will prevent the shipping into the District of Columbia of illegally killed game, to be publicly sold, as has been the case in the past.

After the bill has been approved by the President, its provisions will be printed in *FOREST AND STREAM* next week.

FREDERIC IRLAND.

The Laurentian Club.

THE annual general meeting of the members of the Laurentian Club was held Feb. 9 at the Windsor Hotel, Montreal, and was well attended. This club of sportsmen, which, when it was organized fourteen years ago, consisted of about a score of Canadians, has, through the enterprise of its managing director, Mr. W. H. Parker, become one of the leading clubs in the Dominion. Its preserves, which are situated in the Laurentians, in the counties of Champlain and St. Maurice, consist of a large tract of the finest fishing and hunting territory in the Province of Quebec, and the club is now so popular that, in order to keep down the membership, which has now reached over 250, it was found necessary some years ago to make the entrance fee (which was originally \$25) \$200, and even at this figure the club goes on increasing in size, and has members all over the United States as well as in Canada.

In the absence of the president and vice-president, the chair was occupied by Mr. H. R. Ives. After the usual routine of the reading of the financial statement, which was very satisfactory, and other reports, the following Directors were elected: Dr. W. H. Drummond, of Montreal; Robert Kiernan, of Three Rivers; David S. Cowles, of New York; G. E. Drummond, of Montreal; W. H. Parker, of Lac La Pêche, Que.; Jos. W. Howe, of New York; C. J. Fleet, of Montreal; H. R. Ives, of Montreal; H. R. Wooster, of Deep River, Conn.

At a subsequent meeting of directors the following officers were elected: Fred Stancliffe, of Montreal, Honorary President; Geo. E. Drummond, of Montreal, Vice-President; W. H. Parker, Managing Director, Lac La Pêche, Que.; Joseph W. Howe, of New York, President; J. G. Veitch, Secretary-Treasurer, Imperial Building, Montreal.

House Committee—D. W. H. Drummond, of Montreal; W. H. Parker, of Lac La Pêche, Que.; Robert Kiernan, of Three Rivers, Que.

A Remarkable Game Exhibit.

WHILE I write, the twelfth annual fair of the Oyster, Fish, Game and Industrial Association, of New Berne, is on. One feature of it is so unusual and appeals so strongly to naturalists and sportsmen that I am glad to put your readers in direct touch with it. Need I say that it is the exhibit of wild game? That a collection of some 300 specimens and twenty-odd families should be gotten together in mid-winter speaks forcibly of the attractions which that coastwise section affords to lovers of the gun. The local names of the species are given in my list, and they are, some of them, unique and interesting. I have enumerated them before in some forgotten issue of *FOREST AND STREAM*. Deers and bears seem to have not been of sufficient curiosity to be included in the following.

This is the list: 100 live quail, 4 woodcock, 4 English snipe, 4 double rail, 4 single rail, 6 doves, 1 pair shufflers, 4 mallards, 12 black ducks, 2 spring tails, 4 green wing teal, 2 coots, 2 redheads, 2 hairy heads, 4 summer ducks, 4 boobies, 2 bitrons, 2 marsh hens, 4 wild turkeys, 14 wild geese, 8 squirrels, 10 rabbits, 3 muskrats, 2 owls, 2 wildcats, 8 foxes, 3 coons, 7 possums, 3 woodhens, 3 crows, 5 bald-head eagles, 10 swamp sparrows, 3 large live alligators, caught in Neuse River.

This game display is the finest ever shown in North Carolina, and I make bold to say, in the United States either. No part of the country harbors such a variety of game and fish.

CHAS. HALLOCK.

FAYETTEVILLE, N. C.

Mr. Lee's Alaskan Trophies.

CHICAGO, Ill., Feb. 17.—*Editor Forest and Stream:* I see that Mr. A. B. Blair, of Scranton, Pa., claims that his friend, Mr. E. G. Asmus, of West Hoboken, N. J., has the finest caribou head in the United States, and that it was killed in Newfoundland. I wish to inform Mr. Blair that we do not have to go outside of Uncle Sam's domain to produce a still better one. While on my hunting trip in Alaska last fall I killed one that has fifty-seven perfect points, and the whole head is correspondingly massive. The animal which I am having mounted as he stood in his natural elements, is proportionally large and perfect in all respects.

HARRY E. LEE.

[And *FOREST AND STREAM* has a photograph of the horns to accompany Mr. Lee's story of his trip.]

Game on Clark's Fork.

RED LODGE, Mont., Feb. 15.—*Editor Forest and Stream:* There are about 400 head of elk wintering on Clark's Fork, about sixty miles from Red Lodge, and a good lot of big horns. There have been about thirty head of deer killed within five miles of town. On a trip last November, Paul Bancroft and two brothers with a guide of mine, secured eight bull elk and some deer and other small game.

EDWARD OLCOTT.

New St. Lawrence River Club.

FIFTEEN wealthy sportsmen, most of them New Yorkers, have formed an association for the purpose of establishing a game preserve on one of the many islands of the St. Lawrence River. Among them are James H. Oliphant, William C. Browning, H. F. Dewey, R. T. Wilbur, Charles Emery, of the American Tobacco Company; Charles M. English, of the English Ship-Building Company; the two sons of the late George M. Pullman, Frank Lowdin, Gilbert T. Rafferty, of Pittsburg, and Charles and William Hayden, of Columbus, O.

Oak Island, the one purchased, includes about 600 acres of woodland. It is about four miles from Alexandria Bay, and near the course of the annual sailing races held by the Chippewa Yacht Club. The organization will shortly build a handsome club house, cottages and landings at various points.

Mr. Boldt said to a New York Evening Post reporter: "This is a close corporation, and its members will be limited to fifteen, with one share of \$1,000 each. The island is for a hunting and fishing resort. We will stock it with pheasants and other game."

Dr. Davis Claims Only his Share.

LANCASTER, Pa., Feb. 19.—*Editor Forest and Stream:* In your issue of the 11th inst. I notice the following paragraph: "Dr. S. T. Davis, of Pennsylvania, in a trip to the Jackson's Hole country, of Wyoming, last season, secured four bull elk, one black tail buck, one cinnamon bear, one black bear, two antelope and one very large mountain lion, besides small game and fish. This was my second visit to the Hole, and we found game very plentiful." This is all correct as far as the enumeration of the game taken is concerned, but your informant neglected to mention the fact that I was accompanied by my old hunting friend, Mr. A. C. Kepler, of Lancaster, who added two of the elk, and the antelope to the string. Neither of us would be guilty of killing four bull elk in one season, in the State of Wyoming, or any place, as far as that is concerned. While the law of Wyoming does not specify very explicitly the number of bull elk which may be killed by one person in one open season, the Jackson's Hole Gun Club very gently reminds their guests that they consider two to each gun sufficient.

S. T. DAVIS (Shongo).

Sea and River Fishing.

Proprietors of fishing and hunting resorts will find it profitable to advertise them in *FOREST AND STREAM*.

In the Pound-Net.

BY FRED MATHER.

WHEN a man sets a pound-net miles out in a great lake or sea, with a leader running to the shore to stop all fish and turn them to deep water, and so into his net, he is sure to catch things of various kinds, some that he wants, and others. Awhile ago, so long that my memory runneth not to the contrary, I said that I liked to have questions fired at me, because they brought up things that suggested subjects to write on. The great want of a scribbler is a subject. Given that and his pen goes like Tennyson's brook.

I set my pound-net in the great waters of *FOREST AND STREAM*, and many strange things have been caught. Being strange, they are interesting. Our interest in life is the unknowable, the hope that spurs a man on, whether the soldier, "seeking the bubble reputation at the cannon's mouth," or in the more peaceful pursuit of casting the fly where no trout has risen for an hour, but the next cast may bring one to the surface.

If we could forecast all things life would not be worth the living, and here I want to quote something about looking into the seeds of time to tell which ones will grow and which will rot, but I don't know where to find it. The uncertainty of the chase is its chief charm, and this reminds me of a happy state of affairs in the garden which I had on Long Island. It ran down to the salt water and was a most prolific one; it yielded a good crop every year, but I never knew until I stuck a spade in it whether the crop would be potatoes or clams. Much the same uncertainty attends the opening of the morning mail, or the pound-net.

Old Jack Falstaff, not the gross beast of "The Merry Wives of Windsor," but "Rare old Jack," of the King Henrys, a lovable old rascal, with most of the vices of civilization, said: "I am not only witty myself, but am the cause of wit in others." Success with the berry question prompts a paraphrase of this in some way to suggest that wisdom has been drawn, etc.

More about Berries.

The "service berry" has been well exploited and little more can be said of it that will add to our knowledge of it, unless I should accept the following invitation from Mr. N. S. Smith, of Newburgh, N. Y., to go with him and gorge on them and then give readers of *FOREST AND STREAM* my own gustatory opinion of what Dr. H. H. Montgomery, of Pittsford, Pa., dares to call "a berry before which the raspberry or strawberry, or almost any old berry, fades into insignificance." Such powerful language needs some backing when it is the first outbreak in favor of a berry which is comparatively unknown to civilized palates, and which never appears in our great markets. I admire the enthusiasm of Dr. Montgomery, as I admire all kinds of enthusiasm, and in the coldest of blood hope to test his delicious "service berry," for it is one thing to tell a fellow how good molasses candy is and another thing to give him a hunk.

The Mather Bass Fly.

Prof. F. A. Bates, of South Braintree, Mass., writes: "Somewhere I have heard, read or dreamed that there was a black bass fly called the 'Mather.' What is it like, and is it good for anything? If it is I want to try it next season."

Here is a bit of mislaid but not forgotten lore aroused by the question. It may be ten or it may be fifteen years ago, I received from Mr. C. F. Orvis a bass fly bearing the above name. I say a fly in the specific sense; but there were about twenty individuals. Here was fame! My name would appear on that tablet of immortals in the catalogues wherein are inscribed the yellow-sally, brown-hen, claret-gnat, doodle-bug and cow-dung. I immediately went to a cordwainer's and had him put an extra 1/2 in. of oak tan on my boot heels.

I regret that I cannot give a description of the fly to Prof. Bates beyond the fact that it had large wings of a light olive color, and that was the general complexion of the fly, sober and quiet, like some people. In my joy I mailed specimens to several tackle dealers and gave all the rest, save one, to friends. The dealers saw at once that if this fly were put on the market the black bass would be exterminated, and so refrained from placing it in their spring catalogues. The friends who received one of the precious flies returned profuse thanks and promised to try it. Perhaps they did, and feared to report the number of bass they killed for fear of being classed as "fish hogs." And this is all that is known to me on the subject.

Canning Flies.

The question asked by Prof. Bates brings out another point. One of the above-named flies was saved and will not be accessible until fishing begins. The problem of keeping moths out of flies has puzzled many heads. Once I told how I did it, but it was overlooked by old anglers and was printed too long ago for the new crop of anglers which comes up every year. As it beats all camphor balls and other preservatives, it may be well to tell it again. I "can" them in glass jars, put them up like fresh fruits, and there you are. The reason that the fly named is not to be dug out for present inspection is this: My flies are kept in glass fruit jars, with a rubber band and a screw top, and I'd like to see any durned moth get into that. When fishing is the order of the day the jars are opened, such flies as may be needed for the trip are put in the book, with more that may never be needed, and away we go. On return the flies are replaced in the jar, or the whole fly-book is put in it, and the jar is set on the mantle handy for another day. At the close of the fishing season the jars are stored away in box or trunk with the knowledge that they are safe.

Furthermore: I have flies tied by Sarah McBride on which the gut is as sound as it was when that famous fly-tier died about fifteen years ago. Leaders that must be at least ten years old and never used are strong and good, for they go in the glass jars with the flies. Anglers know that gut gets brittle when exposed to the air for some time. In the jars it does not; the only care I take is to see that no wet flies or leaders go in the jars to create dampness and mould.

I have not bought a fly or a leader in several years, because there was such a stock accumulated when the fly-casting tournaments were being held in Central Park, New York City. I was secretary of the association, and Ira Wood, Francis Endicott and others used to give me their stock brought to the grounds as keepsakes, and by carefully cutting out all parts of leaders that were frayed, and refastening flies where the gut at the shank of the hook was weakened, the stock has been kept up and is, I believe, good for five more seasons without reinforcements, under the treatment given above. This has been a labor of love, for while I never cared to try to tie a fly, I like to preserve one that has done its work well and which often brings memories of a particular day and its catch. These are in the nature of pensioners, and I believe in caring for things which have served us, whether fly, horse or man.

Berries will not be Buried.

This berry racket which I kicked up by asking a simple question has buried my desk under an avalanche of letters, notes—and berries, as well as promises of berries. Some new berries, as well as dewberries, have drifted into the net and have been put in cold storage until there is a market for them. They are not in season now, but snowshoes are.

Snowshoes; Making and Using Them.

And now comes one William H. Avis, who has written to *FOREST AND STREAM* of coon hunting and kindred intellectual games, and to whom I am indebted for saving the lives of a lot of broad-bills which were swinging in to our stools, by prematurely discharging his gun and thereby enabling them to turn out to sea in time not only to save their lives, but also for me to economize on ammunition; but that's another story. Mr. Avis is tall and long of limb, and yet the snows of Connecticut trouble him at times. He writes:

"Dear Major: If I remember rightly; some time ago you invited us of the *FOREST AND STREAM* family to fire questions at you to our hearts' content; and you volunteered to answer to the best of your ability; so here goes. In all my reading of *FOREST AND STREAM* I do not remember a good article giving a description of the way snowshoes are made; how to use them; how much a serviceable pair would cost, and about the length of time it ought to take an every-day sort of a fellow, to learn to use them. I have been bothered so much this winter in getting to and from the city that I have sworn a solemn oath to own a pair of snowshoes. In New Haven, however, such things can't be bought, for there are none here. Please enlighten us on this matter; I say 'us,' because I believe that others would be interested in your talk on this. I write because in your book, 'Men I have Fished With,' you mention the fact that you were on snowshoes for months when trapping in the wilds of Wisconsin nearly half a century ago."

After deeply injuring me, or what is the same, preventing me from injuring a lot of ducks, this man turns my wrath aside, not by a soft answer, but by presenting his other hard cheek. There is a saying which I have heard to the effect: "I can forgive, but I can't forget." I never knew exactly what the relations of forgiveness and forgetfulness were in a general way, but in this case the precise formula was: Ducks = G; premature discharge of gun = I, and my remarks = N.

Invert the terms of the divisor and the rocks across the harbor will echo, "Here's to better luck next time."

Old Muggy-way-way, "he who snored so loud," made the only pair of snowshoes that I ever owned. If Mr. Avis will turn to my book, which he quotes, he will see, p. 206, that I mention being lame from my first three days' walk on snowshoes. Old Muggy lived near Prairie du Chien, Wis., and was a famous maker of these things. I was off on a deer hunt and dropped in on him, oh! so long ago, in 1855, and as I needed snowshoes I braced him in this way: "Say, old Muggy, how much for a pair of snowshoes?"

The old Ojibwa looked up from his work, sized me up, and replied: "So' o' crus'?"

This was away beyond my schoolin', so I asked: "How?"

Antoine was with me and said: "He wan's fo' to know ef you want 'em fo' soft snow or fo' crust."

On these points there were no opinions; snowshoes were merely a name for some kind of a thing to walk on snow with, and I looked at Antoine for inspiration.

"I'll tole you," said he; "w'en yo' got da shoe fo' da sof' snow he longer an' weigh mo' dan w'en yo' gat da short shoe fo' da crust. Now, w'en yo' go along o' me up da Bad-Axe Riv' fo' to trap all da wint' yo' do' want a long heavy shoe fo' sof' snow, 'cause da snow he on'y sof' fo' a day o' two, an' he get a crus' on bimeby."

So I ordered crust shoes for \$2, and saw the old Indian make them. He took the hickory bows from a form where they had been bending for some time; the strips were $\frac{1}{2}$ in. square and 6 ft. in length, bent into a blunt-toed bow 2 ft. 7 in. long and 13 in. wide at its greatest width, 1 ft. from the toe; at 4 in. a strip of hickory 1 in. wide, but thin, was mortised across to keep the spread, which here was 10 $\frac{1}{2}$ in.; at 20 in. another such strip went across where the shoe was only 8 in. wide. From the toe there was no webbing for 8 in., where the first double strip of rawhide was stretched across, sustained by three twisted strips from the first cross-bar. There was but 12 in. of web, which extended to the hind bar. This was made by cross strips 1 in. apart and diagonally interlaced, mak-

clubs for its pursuit could easily be formed in many cities where they have snow which lasts several weeks.

Snowshoes are made of different sizes for people of different avoirdupois. A shoe sufficient for a man of 125 lbs. would not sustain a man of 180 lbs., and in ordering a pair this should be borne in mind, and the weight of the man given. I have no idea that the New York dealer, or his salesmen, understand this, but an order to any Canadian dealer in snowshoes would fit the surface of the shoe to the weight of the man.

A bucksin moccasin is the ideal thing for snowshoeing in dry snow, but they are abominable things when wet. My rig for the damp snows of Long Island is a pair of cloth house shoes, which I use instead of slippers in winter, and which lace up above the ankle, and over these a pair of rubber overshoes. The main thing which the beginner must guard against is stepping on the other shoe; if he does this he will be winking the other eye as his nose is plowing into the snow and he is wondering why he had not thought to wear a pair on his hands at the same time.

The Massachusetts Hatcheries.

MASSACHUSETTS FISH AND GAME PROTECTIVE ASSOCIATION, Boston, Feb. 23.—*Editor Forest and Stream:* I send you herewith for publication an important paper on trout culture, prepared by Mr. C. C. Wood, of Plymouth, Mass., who, as you know, is an authority on such matters. It was read at the last meeting of our Association and was sought for publication, but I desired to have it appear in your paper, and see what sportsmen and men in touch with this line of work would have to say on the salient points of the paper.

While all might not agree as to every conclusion of Mr. Wood's, I believe all will consider it a valuable contribution to a subject likely to be very prominent in the public thought and of vast importance in its bearing upon the work in hand in many of the States of the Union.

HENRY H. KIMBALL, Sec'y.

TROUT CULTURE.

I have been requested by the honorable secretary to furnish a few data and offer such remarks as I may deem fit in relation to the fish hatcheries of Massachusetts. I would say at commencing that so far as my observations go, they relate to the rearing of brook trout only, yet they may not go amiss; for, if I am not greatly mistaken, the hatcheries of this State are given almost entirely up to the reproduction of this variety of fish.

All of us who are enthusiastic fishermen cannot fail to be interested in the inhabitant of our cold, spring waters, and therefore I take for granted would be pleased to see all the suitable brooks of Massachusetts alive with trout. That I am interested in the cultivation of this fish for profit I fear may cause doubt from many as to the sincerity of my remarks in some instances, and should such be the case I desire expressly to state that the facts which I may give will bear full inspection and will remain true, no matter from what standpoint they may be looked upon. It is not entirely for profit, by any means, that I am interested in this matter, and were it so, I should not be likely to advocate a new method or manner of running the hatcheries, for you will all see that the less the results of stocking done by the commonwealth the better are the chances of the commercial fishcultivist for selling his product and the greater prices he is likely to obtain.

First, I would like to ask, for what do we want the fish hatcheries? and we will, no doubt, all agree that it is for the purpose of rearing desirable fish to replenish the exhausted and depleted waters of the State, which have been taxed severely by the fishermen or in many cases rendered unproductive, perhaps by the erection of mills or dams, which prevent the larger parent fish from ascending the streams to suitable spawning grounds.

Some may say that the hatcheries are useful to the student, so that he may watch the development of the young creature, bring himself in touch with the wonders of nature and possibly stimulate an ambition which may help to start him on a useful, successful and prosperous career. I would say to this that the many private hatcheries here in Massachusetts give the same opportunity, as visitors are always welcome, and as a rule these private commercial establishments, if you will, have better, more successful and more modern methods than those at present owned and operated by the commonwealth. However, for this latter purpose no one is likely to propose the continuance even for a day of the smallest hatchery, for such things if necessary for the scholar had much better be embraced in some part of our educational system, as the study of natural history.

In the first case, should the State be able to turn out a very large number of young fish, and these little creatures immediately perish, or do so in a very short time after being taken from the hatchery, the work, so far as resulting in any benefit to the sportsmen, is practically lost. Should this be carried on year after year, and no results follow of a desirable nature, what could be gained? You might go on keeping tally of the large numbers of trout and salmon liberated, and overcome perhaps an ignorant public (for most people are ignorant on this subject), with the immense quantities of these fish put out for their benefit each season; but what the sportsmen and the people want are good results, and they have a right to expect the very best.

What has Massachusetts done in trout culture? Has she succeeded in making the fished-out streams yield a fair day's sport? Has she reared anything like the numbers of trout fry and yearlings possible? Have the hatcheries been carried on as economically as should be expected? And have the results been sufficient to satisfy any one who is at all acquainted with the possibilities of trout culture, and the success which has been attained in many cases? I do not intend to try and tell you what the State has done in the past—what it has cost per thousand to rear these fish (which for the most part have been thrown away), or to criticise the commission in any way. Should any one wish to satisfy themselves on these points they may possibly get the desired information from the reports which are offered by the Fish Commission annually.

Rather would I like to ask: What can she do?—and the reasonable possibilities in this direction are great, for within our boundaries are some of the most delightful streams and ponds suitable for trout that can be found anywhere in New England.

I wish to present, or suggest, two methods by which in my opinion these waters, suited to the gamiest of fishes, may be restocked with the smallest cost and the best results.

One of the methods which I have to offer is a selfish one, and I do not expect that it will receive much consideration, or think that it would be accepted by the State at present, if it were clearly proven to be the best. I have not much to say regarding this, and will leave what few facts I have to offer until the last.

Massachusetts does not need many hatcheries for the rearing of trout; one good one should be sufficient to reasonably stock all the suitable public waters within her borders. It would be easy to hatch out at one station more young trout fry than could be decently used in twice the streams that would be proper to receive them. The cost of maintaining one hatchery, one establishment, must be less than of carrying on perhaps half a dozen of the kind, and the advantages of having the operations under one management, one head, and at one station, should be apparent.

Some may say that the small fish or the large fish cannot be carried from one part of the State to another part most distant without loss, but such is not the case. Trout of any age or size at all likely to be used for stocking purposes, can be transported anywhere in Massachusetts and not suffer. Live trout from the hatchery at Winchester can be safely carried to the most distant part of Berkshire county, and arrive in first-class condition, of course an attendant being with them. Should they be on an express train, however, it would not be necessary to have any one go with them if the applicant be ready to receive them on arrival, for I have known of several cases where a lot of trout was shipped alone from Boston to the western part of New York State and arrived in satisfactory condition.

It would be best in nearly all cases for some one to accompany the fish that are distributed in public waters, for an experienced hand can often make a success of stocking a stream which would result in a total failure if left to one not accustomed—not acquainted—with the work, and perhaps not caring what became of the fish. It would besides render the possibility less of a lot of fish, designed for the public streams and for the public sport, finding their way into some individual's private pond, there to be surrounded and most thoroughly protected with signs forbidding trespass, or stating "No Fishing" to all except the rightful (?) owner.

And the man in charge of a lot of live trout should know his business, should be interested in the work; not afraid of a little extra labor if necessary for the welfare of the fish, and be one who is not willing to trust to luck or who would exclaim when putting out a lot of fry, for example, "Oh, dump them in; I guess they will be all right!"

Some of us who have realized that the efforts of the Fish Commission in trout stocking have been nearly futile strongly assert that there is no benefit to be derived from the use of small fry, but I believe that, if carefully introduced into the proper streams, good results may be obtained in many cases. Is it not possible that, in our desire to condemn an apparent useless effort, we may swing in our judgment too far the other way, and overlook the possibilities in the first instance? What I mean is: would it not be best for the State to put out some fry, some fingerlings, some yearlings, each to be introduced into the waters best adapted for them, and at the time of year when they would be most likely to live?

It is an easy matter to hatch out the fry from fertilized spawn, and it can be accomplished by any one in most any water, and the young fish, during the yolk sack period, are usually easy to take care of, and many do not die. It is after they begin to feed that the trouble commences, and to rear them to fingerlings requires good water at the hatchery, patience and intelligence and watchfulness on the part of the person in charge. At our present hatcheries perhaps the commission has had hard luck in trying to rear fingerlings or yearling trout; perhaps they do not believe in putting out these fish, and would not consent to the attempt under any consideration; yet, we are supposed to have men in charge during the year, a general superintendent and chairman of the commission besides, who are occupied presumably during the season with their work. We will suppose that nothing but small fry is the put-out; these fish, I would be willing to wager, are all distributed by the first of June. What then is the work of the manager, the superintendent of hatcheries, and the chairman of the commission the rest of the season, so far as the rearing of trout fry, or the care of our inland hatcheries is concerned?

At the time of a visit, about the last of August, 1898, to the State hatchery at Sutton or Wilkinsonville, I found one pool with very little water containing about 5,000 fingerlings; one small pool having about 600 one and two-year-olds, and a pond, say, of a quarter of an acre, containing, as I was informed, breeding fish. The water at the outlet of this larger pond was seventy, and the fish, many of them of large size, were dying in considerable numbers. Besides this, I found a very good hatching house, poorly arranged and with an insufficient spring water supply; a nice little cottage for the manager of the hatchery, and a barn and outbuildings, also a man in charge, who, I honestly believe, thoroughly knows his business, and who, if his hands are not tied, would create a something of consequence from the present badly arranged, poorly managed station at Sutton. A competent man could not keep himself half-busy in caring for this station throughout the year all the hatcheries at present combined, with the present system of planting fry, would not keep him busy; but a manager in charge of a hatchery to do only as he is told by somebody else must soon lose all ambition and be contented to loaf if he has the opportunity, and so long as things are kept tidy, the flower bed weeded and the grounds present a park-like appearance, the general visitor may go away favorably impressed with the institution, believing perhaps that there are millions of trout in the pond to be put out for his special benefit next season.

DIFFERENT SORTS OF SNOWSHOES.

1. Alaska model. 2. Montreal shoe, flat. 3. New Brunswick Trappers. 4. Montana "bear's paw."

ing six-sided apertures of irregular size, as rattan chair-backs are woven. The smallest would admit my little finger. The rawhide was soaked and stretched on, winding around the frame.

At the first cross-strip of hide the toe-clip was fastened. It was made of tanned leather, with cords to tie about the heel of the moccasin, shoe-pack or rubber shoe, such as Mr. E. Hough tells of, for the heel of the snowshoe is not lifted with the foot, but always drags, and there must be no boot heel on the thongs. The ends of the wooden strips were brought together for 4 in. and fastened with a brass screw. Evidently old Muggy knew a good thing when he saw it.

Perhaps it might be asked how a man can remember such details after a lapse of forty-three years, and the question would be a natural one; but the old snowshoes are before me as I write, and so is a foot-rule, and such things refresh a fellow's memory wonderfully. The shoes were not needed after that winter, but journeyed to Kansas and back to New York. For years they hung on the walls of my den in innocuous desuetude, until during the blizzard of March, 1888, when they were given a little exercise; they were promised a few miles last month, but rain spoiled the game.

The width of the snowshoe and the fact that only the toe is lifted from the ground necessitates a peculiar gait. The foot is raised high, moved forward and planted before the other is stirred; this brings new muscles into play, and some soreness is felt the next day, as in skating; but the trick is easily acquired.

The long Canadian pattern, with sharp, turned-up toe, would be best for Mr. Avis, or for any one who lives where snows come frequently, as they are closer woven and have greater bearing surface; but mine were built for a land where snows come seldom and soon crusted over.

There is a window in New York where I see elaborate snowshoes, trimmed with bright red tassels, handsome and artistic things, and no doubt high priced. It seems as if some dealer in Quebec, Toronto, or other place where they sell snowshoes would do well to put an ad. in FOREST AND STREAM. There was a club in New Jersey called the "Oritani Snowshoe Club," and the late Wakeman Holberton was a member of it; he often asked me to come over to Hackensack and have a run; but snowshoeing opportunities about New York City are here to-day and gone to-morrow; the invitation reaches you after the snow has disappeared. It is good sport, and

What I hope for some time is to see a consolidation of the hatcheries, and the sooner the better. If we have been unwise enough in the past to locate on unsuitable grounds, then let us abandon them; let us close the stations that with ample opportunities have proved themselves to be worthless, and let us erect somewhere within our State one hatchery that is the best, the largest and most productive for the rearing of trout and salmon of any in New England, public or otherwise. And it will not take an immense amount of money to accomplish this, no large appropriation would be necessary, and when once established on a proper basis and run in a businesslike manner, the annual expenditure would be trifling compared with the number and size of fish put out each season. It is a sure thing, this rearing of trout, as sure as the raising of corn, provided you plant your seed in the first instance as intelligently as the farmer will drop his kernel of grain.

And we go on building new stations, to be conducted in the same old way! Why do we do this? There must be reason, and no doubt many of you present can answer better than myself.

But the time is coming, unless something is done, when we will perhaps wake up too late; the people will learn the facts, will protest against this farce of artificial propagation of trout, and the fish hatcheries of Massachusetts will be a thing of the past (for a time at least), and a disgusted public may not again be easily led into the spending of money in what they have a right to present to condemn and class as an extravagant and foolish outlay. Suppose in any business enterprise the manager should go on year in and year out without making it a success, when other men of like calling were flourishing about him, would the owners let him continue as he saw fit with continual failure? Surely such would not be the case; the business would at once be stopped and a new manager installed without delay.

There are men in plenty who understand the rearing of trout, men who are responsible and conscientious in the discharge of their duties, and successful withal; and some such person should have full control of the hatchery and be allowed to conduct the same as he sees fit; for, in the rearing of fish, as in many other cases, too many bosses are apt to make a bad mess of it. A man left to himself, knowing that he will receive the credit of success, will have something to try for, and a man will do more when you set his ambition and pride at work than perhaps he would do were his salary doubled.

Then in brief let us consolidate the hatcheries; let us give some one who has proven himself successful in the rearing of trout full control of the same; let us have a commission who is open to conviction, capable of understanding and appreciating the value of new and better methods, and one who is thinking most of the success of the undertaking, with the thought of their reappointment taking second place; then, with the right man at the wheel, the hatcheries of Massachusetts will give an abundant supply of strong, healthy, handsome fish, enough to satisfy the reasonable demands which may be made by the sportsmen or fishermen upon the beautiful streams which God has been pleased to place so near our homes.

The other method which I have to offer and which I styled the selfish one (because at present I would be interested in securing a part of the appropriation) is that the State purchase what she desires from the private hatcheries, and that she would be well served I feel sure. There is no one here in the State who has a monopoly of the business; competition is such that there is no danger of the prices rising to an unreasonable figure, and the fact that the State might at any time establish a hatchery if dissatisfied that would keep the prices down to a low level.

To show you the condition that competition among us commercial dealers has brought prices, I would say that trout spawn can now be purchased at 30 cents per 1,000, trout fry at \$2 per 1,000 in April, and fingerlings at from \$15 to \$20 per 1,000 in November and December—which is about one-quarter of the price obtained for this product less than five years ago. The trout hatchery at Plymouth, which at present is under my care, is capable of turning out a considerable quantity of fry and yearlings, and we should be pleased to give a money guarantee to furnish the State with 2,000,000 fry and 500,000 fingerlings and yearlings, provided the order was given in advance each season, and probably at a figure somewhat less than the prices already quoted. In purchasing what fish she wants the State runs no risk; she is sure to get what she wishes, which is not the case where a hatchery is maintained, for accidents may happen which will result in the total loss of the season's hatch. New Jersey follows this method of purchasing what she requires, and is well satisfied with the experiment.

Quoting from the last report of the Fish and Game Commissioners of the State just mentioned, they say, "If the former price of trout, from \$50 to \$75 a thousand, had continued, there can be no doubt that it would have been more economical to establish a State hatchery, but competition has been so keen among the owners of private hatcheries that less than \$1,000 was sufficient last year to pay not only for the stock, but for the distribution as well." "Without allowing any margin whatever for interest on investment in real estate and buildings, it would cost more than \$1,000 a year to maintain a hatchery." "New Jersey can buy its trout more economically than it could rear them."

In any event, in my opinion it is sheer foolishness to go on as we are now doing, and I sincerely hope that something may be done for the better immediately, and that we may be able in a short time to boast of a hatchery, if we have any, that we may be proud of, and that will give to us that which we should have from maintaining such an establishment—good fishing throughout our public streams.

A German professor, in giving his experience as an explorer in the wilds of Africa, says that the best protection against lions is an umbrella, as the beasts are especially afraid of one when opened suddenly upon them.

Two biograph pictures of the late Felix Faure starting on a hunting trip and shooting birds were shown at a New York theatre the week of the French President's death.

Salmon of Lakes Champlain and Ontario.

NEW YORK, Feb. 23.—*Editor Forest and Stream:* During my recent visit to Quebec in relation to their new fisheries bill, and while in conversation with the Hon. Mr. Marchand, the Provincial Premier, I mentioned that here in New York State we had a direct interest in the proper protection in Canada of salmon, and that it was solely because Canada would not guard the salmon from the mouth of the St. Lawrence westward that they no longer appeared in Lake Ontario, in our Northern rivers, and in Lake Champlain, where they had once been so abundant.

Mr. Marchand was much interested in the statement, and said that though he had lived in St. John's, P. Q., all his life he had never known that salmon had once been abundant in the vicinity. I told him that it was so much a matter of public record that I thought I would have no difficulty on my return to New York in furnishing him with more detailed information on the subject.

As it may be of interest to your readers and aid in that necessary public attention to the subject which is the prerequisite of progress, I enclose you a copy of the extracts which I sent him, taken from the report made to the United States Fish Commission by Mr. W. C. Watson, on "The Salmon of Lake Champlain and its Tributaries," which was printed as Section XXIV., of appendix B, of the United States Fish Commissioners' report for 1873-75.

Mr. Watson not having had any great critical or scientific knowledge of salmon, much of those portions of his report which deal with possible reasons for the disappearance of the fish, etc., as well as his description of their traits are not, in the light of later experience, of sufficient importance to reproduce at the moment, in view of their length—but the facts which are given in relation to their former abundance in the locality are of distinct interest, and I think might advantageously be given the wider publicity of your columns, as matters hidden in old reports so seldom reach the eye of the general public.

It is a pleasure to note that Mr. Marchand, writing to acknowledge the receipt of the paper, refers to the great importance to his section of the Province of the matter, and promises for the subject his particular attention.

Let me add that the general and intelligent consideration which the protection and preservation of salmon is receiving from the Government and officials of the Province of Quebec is a gratifying augury of better conditions in the future for this best and most also persecuted fish of the Atlantic Coast.

CHAS. STEWART DAVISON.

Salmon of Lake Champlain and its Tributaries.

BY W. C. WATSON.

Sir—I take great pleasure in complying with your request "to prepare a paper on the salmon of Lake Champlain and its tributaries." I fear, however, that I shall not succeed in furnishing anything novel or interesting, or add essentially to the views I have already published.

Abundance of the Salmon in Early Times.

SINCE the receipt of your favor, I have sedulously tried to trace old residents from whom I might derive some new facts or incidents illustrating the prevalence of the salmon at the early stages of the settlement of the region, or for observations disclosing fresh or unfamiliar traits in their habits. My efforts have been attended with only trifling success. When I first engaged in the investigation of this interesting subject, nearly a quarter of a century ago, I secured information from many persons, whose recollections extended almost to the period when the fisheries of the country were in their normal condition, or of those who had received traditions of the salmon from their immediate ancestors, which imparted much valuable intelligence. I garnered up from such sources many important facts, but now, when I attempt to renew these inquiries, I find that few of that class of persons remain, and that the field of research is very limited.

One fact, which is fully established in the traditions of the salmon fisheries, has, I conceive, important bearing on the scheme in which you are so deeply and efficiently interested, and presents most favorable auguries of the success of the undertaking. I refer to the wonderful exuberance of this fish when the country was first occupied. I base the opinion upon the idea that this exuberance indicates that the locality was congenial to their habits, and that they were attracted to these haunts by peculiar causes. I will venture to suggest a few speculations on the subject, although they may appear crude and unphilosophical to your great experience and attainments.

I believe that no other waters, not even the tributaries of the Onion (now called Winoske River), ever exhibited so extraordinary a copiousness of these fish—and certainly they could not have exceeded it—as they appear to the occupants of the Champlain Valley in the latter part of the last century, and early in the nineteenth. The natural causes are very obvious which produced this result, and among them a few circumstances may be indicated. Lake Champlain was readily accessible to the salmon from the ocean by the way of the St. Lawrence and Sorelle or Richelieu rivers, and was also comparatively contiguous to the cold northern seas. The streams emptying into the lake have generally a short course, and usually with long reaches of gravelly bottoms are rapid in their currents and start from cool lakes and ponds, and in their passages at that time were largely fed by cold springs and shielded in their whole progress by the canopied of heavy umbrageous trees and bushes, which effectually shielded them from the influence of the sun's rays and the warm air. A coolness of the water not exceeding probably 45 degrees, a temperature so delightful to the salmon, was thus maintained. Each of these qualities of the streams, impetuosity of the current, a gravelly bottom, a low temperature, to which may be added great purity, is a condition of nature eminently attractive to the salmon. They enjoyed repose and impunity amid the utter silence and seclusion they loved. They were not hunted by the ruthless sportsman, or even disturbed by the spears and nets of the Indians. They had easy and safe access to

their favorite breeding grounds. When Champlain entered the lake in 1609 he found its shores unpeopled and silent. The smoke of not a single wigwam arose in the atmosphere on either shore. The bloody and perpetual incursions along the common highway it afforded, of the Mohawks and Algonquins in their reciprocal attacks, had driven the savages that once inhabited the beautiful territory into the recesses of the interior for security. The region bordering on the lake was a scene of total desolation, and continued in that condition to the middle of the succeeding century, and was but sparsely occupied until near its close. In the view I have embraced this aspect of nature rendered the lake and its affluents singularly adapted to the habits of the salmon, and attracted them in the remarkable abundance which we shall see did exist.

The fact of the exuberance of the salmon in these waters when the environs were first occupied by civilized man is established by the most ample and satisfactory testimony, and appears to me worthy of perpetuation, as interesting in its relation to natural history, and as calculated to aid and illustrate the future researches of the student of nature.

The first historic notice of the prevalence of salmon in the region, I think, appears in the correspondence between William Gilliland, the pioneer of the Champlain Valley, and Arnold, who was cruising on the lake with the American flotilla in the summer of 1776. His letter states that on a single occasion Gilliland had presented seventy-five salmon to a petty officer of Arnold, and asked the service of the ship's carpenters to repair his "salmon crib and apparatus, which had been carried away by a great flood." He also affirms in a memorial to Congress in 1777 that he "had complimented the American army with 1,500 salmon in one year." When the writer first became a resident of the district in 1824, many of the original settlers of the country were yet living who were men of respectability and position, and of undoubted veracity. Their tales of the abundance of the salmon which prevailed at that time demanded for their acceptance an exercise of the strongest faith in the truthfulness of the narrators. Coming from the unimpeachable sources they did and corroborated by uniform traditions and the current of universal testimony by actual observers or participants of the incidents, there was no hesitation in receiving the statements as authentic and true. I have heard the account from several of these individuals that when they immigrated many streams were so thronged by the salmon that it was unsafe at particular seasons to ride a spirited horse into them, for the reason that the fish were so abundant and bold that they would fearlessly approach the horse and strike him with great force by the powerful muscular action of their bodies. It was often represented that it was a common pastime, as well as as a most desirable means of obtaining food at that time, to drive a team into some of the shallow tributaries of the river, and from the wagon spear the salmon with pitchforks and thus obtain in a few minutes all the fish needed for consumption. Many of the salmon taken in this primitive method would reach 20 lbs. in weight.

Among the various persons from whom I have received interesting information in aid of my inquiries, I am particularly indebted to Silas Arnold, Esq., of Reesville, for several facts, which were communicated to him by his father, Hon. Elisha Arnold. This gentleman was one of the earliest prominent settlers and subsequently attained high social and political standing in the district. Among these incidents, Mr. Arnold recalls the following circumstances, which, coming from so intelligent and reliable an authority, amply corroborates the almost incredible traditions of the former copious prevalence of the salmon in these waters. About the year 1800, or possibly a year or two previous, at any rate it was at so early a period in the occupation of the country that the pathway through the woods leading from the residence of Judge Arnold, situated near the center of the present town of Peru, to Plattsburg, was marked by a series of blazed trees. As he was proceeding to the latter place in fording the Little Au Sable, a small shallow stream near its mouth, the passage of his wagon was largely impeded by the throng of salmon which was in the stream, and he readily caught and threw upon the bank all he wished to take.

Mr. Arnold has called my attention to a familiar fact, which is observed among all gregarious fishes, and is peculiarly characteristic of the salmon family, and tends to relieve the marvelous tales of the early exuberance in the Champlain region of the salmon from their incredible aspect. He says that they ascended the streams in shoals or schools which intermitted in their progress, and that the flow of the fishes was not constant or continuous as might be inferred by the language of the traditions; that when encountered in the vast masses so often described they were passing a particular locality, consolidated in one of these shoals or schools.

Mr. Oscar F. Sheldon, formerly of Willsborough, Essex county, communicated to me a record which he deems perfectly authentic, of 500 salmon being taken in a single afternoon early in the present century from the River Bouquet. The Bouquet is a tributary of Lake Champlain, and may be regarded almost as an estuary up to the falls, a distance of about three miles, and is navigable to that point by vessels of light draft. It was therefore peculiarly adapted to the habits of the salmon, and beyond the falls, I think, they could not penetrate.

The record of the circumstances of capturing 1,500 lbs. of salmon in the year 1823 at a single haul of the seine near Port Kendall, in the town of Chesterfield, in the county of Essex, was said to have been among the papers of Levi Highby, Esq., in 1852. He was a man of high character, and was, I understood, an actor in the achievement.

This fact is not only memorable for the extraordinary quantity of the fish taken, but it also illustrates the singularly erratic and inscrutable habits of the salmon. In all my investigations on the subject, this is the only instance that I have learned of the salmon being taken in any great quantities, except from the rivers and their branches. The facts connected with this incident seem to claim some attention, as calculated to throw a little light on the history of the fish. Between the Bouquet and Au Sable rivers no stream of any magnitude enters the lake, except the brook that debouches at Port Kendall,

This brook plunges over a sheer precipice of at least 40ft. directly into the waters of the lake, without any, or scarcely any, space intervening. The immense catch of salmon recorded could not therefore have been taken while they were attempting to reach their spawning grounds, but were found near the shore, although in the open waters of the lake. They must necessarily wander through the lake in schools, but this is the only case which I have been able to trace where they have been captured except in streams or in the act of entering into them.

These facts, which might, I think, be accumulated by a large catalogue of similar incidents, are sufficient, in my judgment, to sustain the proposition that the waters and the tributaries of Lake Champlain were teeming at a former epoch with salmon to an extraordinary if not unexampled extent.

The Disappearance of the Salmon and its Causes.

Unhappily, another fact, alike regretted by the sportsman and the political economist, is equally clear—the total disappearance for many past years of this prince of fishes from the region. * * *

The Hon. Thomas B. Watson, of Peru, Clinton county, communicates to me the following statements, which he received from an aged man, whose whole life has been devoted to fishing. * * * He said that he was engaged in 1838 in capturing between fifty to sixty salmon in the Au Sable River, and that no salmon had appeared in that stream for the fifteen years preceding. * * *

The quiet the salmon constitutionally delights in and its sense of security have been invaded, with consequences still more effective, by another agency, which became augmented by the increase of population. I refer to the persistent and inexorable hunting that not only assailed them by the net and the jacklight and spear, but pursued them in their gravelly beds and breeding grounds, and there not only ruthlessly slaughtered the mothers and millions of the embryo, but drove innumerable multitudes in panic and alarm from the waters, probably never to return to their former haunts. * * *

Another qualification of the waters which is essential to the comfort and enjoyment of the salmon is that it should be pure, and in the words of Judge Watson, "highly aerated." The rapid erection of saw mills, until they occupied almost every water power, literally extinguished in almost every stream this native condition. The sawdust stained and polluted the water, and the sediments and debris of the mills settled largely on the gravelly bottoms, which had been so alluring to the salmon, changed their character, and revolted the cleanly habits of the fish. Mr. Arnold mentions another effect from this cause which may have exerted a greater influence. He has observed in his own experience that the sawdust with which the water was charged was necessarily inhaled by the fish with the fluid, and that particles of it was not ejected, but remained adhering to the gills. This mechanical effect must have produced annoyance to the creature, with succeeding suffering and possible death. * * *

The popular excitement became at length so deeply inflamed by acts which were then regarded as encroachment on public immunities that the grand jury of Clinton county, New York, were impelled in the year 1819 to present an indictment against the proprietors of the dam erected at the mouth of the Saranac River in Plattsburg. The indictment, among other averments, alleged that previous to the erection of the dam "salmon were accustomed to pass, and actually did pass, from Lake Champlain into and up the Saranac River for a distance of twenty miles," * * * "and that before the dam was built salmon were seen above the site"; and that "after it was built many were caught at the foot of the dam, but none above it; that salmon begin to ascend the river from the lake in June and July, but largely in August and September." It appeared that the dam was 14ft. high, and the sluiceway 40ft. long, and arranged at an angle of 30 degrees. * * *

The Au Sable River.

An aged man is still living who informed Dr. George F. Bixby, of Plattsburg, that in his boyhood he was in the habit of carrying a torch of jacklight for a sportsman to spear salmon in this stream, and that they killed them often weighing 20lbs. They would descend the high bank and enter the river near the head of the natural canal, and wading in the water toward the fall, found the fish lying upon the bottom, who, either dazzled by the light or careless in their refuge, would allow the spearsman to approach them sufficiently near to strike. He represented the fish as appearing when the torch light was reflected from their mottled backs like bunches of hay sunken in the water. * * *

The valued correspondent from whom I have frequently quoted writes me that when a child he saw a man sitting in a boat at the head of one of the rapids I have described, and drawing in the salmon with great rapidity; that he cast a long line and a common hook baited with a piece of pork into the rapids, and that even before the hook touched the water the fish would seize it with the eagerness that is often displayed by the trout. This is the only instance that my inquiries have disclosed of salmon being taken in these waters by the hook. It was a common sport fifty years ago to seek the salmon on the falls, where they are speared in great numbers as they attempt to leap up the precipice.

Fish Benumbed by the Cold.

A GENTLEMAN who returned to the city Saturday from Jacksonville, Onslow county, N. C., reports some remarkably large catches of trout that were made in New River, below Jacksonville, after the unprecedented cold weather of the early part of the week. He says that there were on a conservative estimate at least 15,000 on the landings at Jacksonville Friday, varying in weight from 3 to 15lbs. each. They were brought to Jacksonville in boats and were sold in quantities as low as 4 cents each, taking the lots as they came. A large quantity of them were brought to Wilmington, and the dealers found ready sale for them at 73 to 75 cents each. There were also quite heavy shipments made to the Northern markets via Newbern and via Wilmington. Fishermen say the trout were benumbed by the cold and were easily scooped up in dipnets, and some were even caught by hand.—Wilmington Star.

CHICAGO AND THE WEST.

More about the Japanese Fly-Fishing.

CHICAGO, Ill., Feb. 23.—Mr. J. O. Averill's most interesting paper on Japanese fly-fishing continues to elicit interesting comment. Prof. L. V. Pirsson, of the Sheffield Scientific School, New Haven, Conn., is so good as to write under date of Feb. 18, in regard to the communication above mentioned, and he adds to my collection of sporting treasures several little items which I value more than much fine gold. I shall take the liberty of quoting very liberally from Prof. Pirsson's letter, since it is of such interest to the wide FOREST AND STREAM family. He goes on to say:

"Your letter in the recent number of FOREST AND STREAM in regard to Japanese trout fishing methods interested me very much indeed. Some ten or fifteen years ago a friend of mine, an importer and dealer in Japanese goods, who was also very fond of angling for trout, obtained from Japan a number of trout flies used there and was kind enough to give me a half-dozen of each variety. Thinking from your letter that it would interest you to see them, I inclose one of each kind. You will notice the old familiar patterns, the brown, red and black-hackles, and all tied 'buzz,' as you described in your letter. The small size is very noticeable, and I suppose they may be intended to represent ants. They vie in delicacy of tying, and in pattern with the finest English midges. For comparison notice the one I inclose; it is one of the large number given me a number of years ago by an old angler, whose age had forced him to retire and who had obtained them over forty years ago from England. I had always supposed from these Japanese flies that the trout were rather small and well educated, compelling the Japanese to fish 'fine and far off,' but I have never been able in reading or otherwise to obtain any information on the subject until I read your letter. These flies would hardly do, I should think, for the method your friend describes; they would seem rather to indicate a 'dry fly' method. Perhaps there are two schools of fishing there.

"You will also notice that lack of a barb and the peculiar turned-in shape of the round bent hook, which I suppose is intended to atone for it, by giving a turned-in line of draft. It would appear that the Japanese have little to learn from us in fly-fishing, and could probably give us points.

"Unfortunately the smells on these hooks are very fragile. I do not know whether this is original or whether they have deteriorated, but I have never dared on this account to try them. I have always intended to whip a good piece of drawn gut on, and try them some time, but have never done so. On the other hand the beautiful gut on the English fly is as sound as a dollar, in spite of its age, and I have used them with great success on our streams. I have not had an opportunity yet to try the new method you advocate, but I shall certainly do so when I do."

Kekoskee Vindicated at Last.

The mills of the gods grind slowly, but their breakfast food comes out all right when they get done. I presume a great many readers of FOREST AND STREAM remember the original publication in these columns of the Kekoskee fish story, and remember also the derision with which it was received as merely a gigantic fish lie. With meekness as became one of worth, I bore the contumely which was heaped upon me as inventor of this tale, insisting ever that it was no myth, no invention, but only part of the Saga of Wisconsin, one of the monumental occurrences in the history of the land. One by one proofs of the accuracy of my statement have come to light, gradually proving the truth of the old saying that truth is mighty and will get there in time. In Dr. Lake's letter, to which I have above referred, I find the following very interesting advice:

"Imagine my surprise the other evening while calling on an old friend of mine who used to live in Wisconsin during the 50s to hear him tell me that 'Kekoskee Fish Story' that you so graphically related some time ago in FOREST AND STREAM. I laid low and quizzed him closely as to the particulars. He saw fourteen sleigh boxes loaded one afternoon. Said a farmer could get a sleigh box filled for a quarter. Had heard how one of the boys had walked across an opening in the ice, below one of the mills, on a solid mass of bullheads.

"He had never heard of old 'Santa Anna,' which was a great grief to me, as otherwise the story was quite complete. You can imagine how much I desired to hear him tell all about 'Santa Anna' because that story has worried me some. Then to get such testimony from an entirely independent source confirming every particular but one. Well, it was too bad! Still, I shall never worry any more when I take up FOREST AND STREAM and turn to 'Chicago and the West' column."

I trust that Dr. Lake will carefully investigate the reliability of his informant. Any man who has seen the bullhead volcano at Kekoskee, and not heard of old Santa Anna, the horse that lived on fish, has a character that needs looking into. Yet on the whole, as I have remarked before, we must regard this matter as being direct proof of the accuracy of a story whose huskiness needs but small support.

Bass Fishing in the South.

My friend Joe Irwin, of Little Rock, Ark., is apparently in a hurry to have the winter close, so that he can go bass fishing. He wrote up last week in great agitation, and said that he wanted a casting reel, and now I have his letter stating that the one I had sent to him is all right. It seems that the Japanese-Taylor cult is in process of catching on in the South, for Mr. Irwin writes:

"I expect to cover some bass ground this season by casting that should bring many good fish that I have been unable to reach heretofore with 'the fly,' as I have long since given up bait-rod fishing and use fly-rods exclusively. I am greatly interested in the trout fishing, as Mr. Taylor and Mr. Arnold, the Japanese friend, but would like to see something of this kind on taking the bass. 'We are planning to have a good time with the bass by moonlight this season,' and will write you about

it. I have had one catch by moonlight, using a large white buck-tail fly below a mill dam, where I took over thirty from one pool. I find this fishing is practiced largely by anglers on the Upper St. Francis. They lay up in the heat of the day, and then go out when the moon gets good and bright. One friend I know took fifty-six small-mouth one night before 11 o'clock (Geo. R. Mann, St. Joseph, Mo.)

"Live bait is hard to get here, but if we had those cast nets like they use down at Aransas Pass to catch mullet with, which is the bait for tarpon we would have better luck. Do they have them in Chicago? If so, kindly get one for me. We have no frogs to speak of, as they do up North; so we must depend on phantom and spoon bait for bass. I prefer to cast live minnows, as you get so much better sport with a single hook than with the spoon, which holds the mouth of the fish open."

I have from time to time spoken in these columns of the success my father and myself had fly-fishing in the early evening along the Wisconsin lakes, but I have never tried the bucktail, which is hardly to be called a fly at all. Mr. Irwin will no doubt catch more fish casting with bait than he would by using the fly, and I very much doubt if the Taylor method of trout fishing would work so well with bass, since the lying ground is so different with bass from that frequented by trout. I reckon I can get Mr. Irwin the casting net he wants, but I am very much pained to have him say there are no frogs in Arkansas. When a country gets so poor it can't support frogs it is pretty hard up. We are told that even Egypt frogs were now and then very abundant.

Singing Mouse No. 12.

"By the way," Prof. Pirsson adds, "when I was a boy we also had a singing mouse in our house for a time. We thought at first it was our canary, but as the notes and singing seemed strange we investigated, and discovered it was a mouse. He was around for several weeks, and heard on a number of evenings. I have seen this trait of mice alluded to in a natural history somewhere, but I cannot now recall where. If I happen upon it I will let you know."

In regard the flies which are thus so generously shared with me, I must say that they equal in delicacy any that I have ever seen, and need in no way take a place behind the workmanship of the fine English fly which Prof. Pirsson incloses with them. Yet they have a bizarre, across-the-ocean, other-world sort of look to them, which gives them an indescribable character not to be conveyed by a black and white drawing, although I have jealously loaned one or two of them to the editor of FOREST AND STREAM for the purposes of an engraving, should anything so small be visible in printers' ink. I regret very much that the snells of the curious little flies are reported to be too delicate for actual use, for I should dearly love to try them on real trout.

At first sight it would appear that the barbless hook of these curious flies would have no holding power, since it is merely a bit of needle-pointed fine wire. Wishing to discover the theory of this hook, I tried it on my finger, and found that it holds perfectly. Indeed, in some ways I should think it might hold nearly as well as our fine barbed hooks. After the point sinks into the flesh, a continued pull gives it a tendency to turn and come out again, the round end of the hook acting as a fulcrum to this end. When the hook has thus entered and come out, it embraces a narrow strip of flesh, from which it would not easily be released on a reasonably taut line. The hook which I tried was one with a round bend, but perhaps the square bend might work in something the same way. One of the hooks inclosed has the shape of Kendall sneek, but the others are unlike anything I have ever seen. At first sight they look like hooks from which the barb has been broken, but closer observance will show that the point of the hook turns up until it is about opposite the halfway point on the shank. It is not often that one takes from the mail a letter inclosing such valuable curiosities as these, and also mentioning an instance so rare as that of the discovery of another singing mouse. As I have so often before had occasion to remark, the FOREST AND STREAM is a great developer of curious and interesting facts in natural history, and in all the details of outdoor things. I shall very closely guard my little Japanese treasures, and I am very willing to agree with Prof. Pirsson when he says there seems to be little that we can teach the Japanese anglers.

E. HOUGH.

1200 BOYCE BUILDING, Chicago, Ill.

The Taylor System.

CHARLESTON, N. H., Feb. 24.—Editor Forest and Stream: Mr. Averill's very interesting letter, as inclosed in Mr. Hough's last, on "Fly-Fishing in Japan," combined with Mr. Hough's former account of Mr. Taylor's system, combined with an experience of my own, has led me to think that there may be something in this method of "challenging the trout" worth remembering and experimenting with another season.

The experience to which I refer was this: Some fifteen years ago I was up at Amasa Waed's Camp, on Greenough Lake, in Wentworths Location, N. H., accompanied by my youngest son, who was taking some of his first lessons in fly-casting.

He had begun the year before at the Diamond Ponds and "caught the nack" readily, and been quite successful. It was a bright sunny day, and we had been very unsuccessful. I had taken one good trout early in the morning, and had not had another rise. Two others in our party had only caught one or two trout each, and my son had got one. Toward the end of the afternoon we were up at the upper end of the pond, furthest from the camps, where the bottom was very rough, large rocks rising often nearly to the surface, and now and then protruding themselves above it, making capital lurking places for the trout, and diligently whipping the water in all direction, when my son had a rise, but "failed to connect." He cast again in the same place, with the same result, and repeated the operation, until on the seventh strike, he hooked and landed the fish, a fine trout of about 3/4 lbs. The other boat was close to us, and all four were casting near to-

gether, and we all saw the performance clearly, and were all struck with the instant and savage pertinacity with which that trout returned to the charge every time. He broke water as soon as the fly did, and his actions seemed to carry out the theory, that he had got mad at that buzzing insect and was determined to get rid of him. As I remember, it was the only fish that afternoon. The Japanese hook shown in the letter, reminds me very much of the first Limerick hooks I ever had, and which were given me more than sixty years ago. They were fly-hooks, but untied, and from No. 4 to 12. I used them for bait, but they had the same sharp angle below the bait, and long curve to the tapered shank, and were genuine Limerick, not copies.

The "Farnholse Vacation" is very true to life.

VON W.

"Uncle" George Brower.

ASBURY PARK, N. J., Feb. 23.—In the recent death of "Uncle" George Brower, the community has lost one of its most cherished landmarks, and the fraternity one of its most ardent adherents. I have frequently referred to his exploits in the columns of FOREST AND STREAM. Although ninety-three years of age, he rounded out the season with us, and up to within a few weeks of his death was sprightly far in excess of his years. Hundreds of anglers from all quarters of the Union will miss his familiar form on pier, lake and river. Of a most happy and congenial spirit, he was ever welcome among all classes. Although stricken with an incurable malady, he retained his wonderful vitality to the last, and within a few days of his death he wandered from his home and was found in the depths of the woods he loved so well, meditative and happy. Long live his spirit.

LEONARD HULIT.

Nets in Jefferson County Waters.

A MEASURE introduced into the New York Legislature by Mr. Brown provides for the appointment of local fish commissioners for Jefferson county, who shall be empowered to license netting in the waters of the county for taking fish other than game fish. While the bill is fair enough in purport, in actual operation it will mean the netting of bass, pickerel and muscallonge; and public interests demand that it shall not be made a law. The newly organized Jefferson County Sportsmen's Association might well give attention to this matter.

The Sportsmen's Exposition.

THE Sportsmen's Exposition in the Madison Square Garden, of New York, now in progress, was not yet so far advanced in preparation on Tuesday, when the FOREST AND STREAM was put to press, as to enable us to give a description of the features in the present issue. Suffice it to say that the exhibition has been projected on a much more liberal scale than ever before as to camp-life and woods representation. The living game animals, birds and fishes are here, as at Boston, a drawing card; and particular interest is shown in the trout hatchery operations. A full report of the exposition will be given in our next issue.

Camp-Fire Glickerings.

"That reminds me."

LICKING, Va., Feb. 9.—They were all sitting around the old-fashioned Virginia fireplace relating their experiences and exploits afield. Among them was old man Daniel Lane. Old man Daniel was always full of reminiscences and anecdotes of the "days before the war"; but he was astonishingly reticent on this particular occasion. And save an occasional smile, with which he greeted the conclusion of the relation of some particular humorous episode, his face was stolid and immovable.

Presently the conversation turned upon the remarkable shots made by various members of the group. Old man Daniel's face lighted up, and when it came his turn to talk, he removed an enormous quid of tobacco from his mouth, cleared his throat, and began:

"Long time ago—before the war—I was the overseer for old Mr. Guy, on his large James River plantation. In those days blackbirds were so numerous as to sometimes darken the sun. One day I concluded I would take my gun down, hide myself in a shock of corn and try to kill a few of them. So I took my gun down, one morning, and hid in the shock of corn. After a while blackbirds by the thousands began to come and light in the field around me. Presently I stepped out from the shock of corn, leveled my gun at the flock. As I did so the black birds rose and I fired."

"How many did you kill?" anxiously inquired a member of the group.

"Well, sir," was the reply. "I didn't kill a durned bird. But I went out there afterward and picked up half a bushel of feet. I think I must have shot a little too low."

BANG-BANG.

[This is interesting because it illustrates the way in which these old stories are told and retold the country over and the centuries through, as bits of personal experience of their narrators, or of that of "a man down our way."]

The Legislature has had to deal with a large number of game laws during its present session, and in the proceedings of each day's session a law preventing hunting without permission in certain counties is passed. Such laws are, of course, enacted as a protection to the land owner, but they are likely to do more harm than good in a few years, on account of the great increase in the rabbit crop. Even now the farmers in sections of western North Carolina are glad to see the hunters, as the rabbits are seriously injuring the wheat crop, amounting to a regular pest in some communities.—Charlotte Observer.

BENCH SHOWS.

March 7-10.—Grand Rapids, Mich.—Butterfly Association's bench show. Miss Grace H. Griswold, Sec'y.
March 14-17.—St. Louis, Mo.—St. Louis Kennel Club's show.
March 21-24.—Chicago.—Mascoutah Kennel Club's show.
April 4-7.—Boston, Mass.—New England Kennel Club's bench show. James Mortimer, Manager.
Nov. 22-24.—New York.—American Pet Dog Club's show. S. C. Hodge, Supt.

The New York Dog Show.

THE twenty-third annual bench show of the Westminster Kennel Club was a great success. The entries were a record breaker, numbering 2,055, and the total number of dogs were 1,526. Mr. James Mortimer managed in his perfect record manner, and the attendance was so great that at times it was difficult to move about between the aisles. Mr. John Davidson judged foxhounds, pointers. Mr. Geo. B. Post, Jr., judged beagles. As heretofore, the show dates Feb. 21 to 24, inclusive, included Washington's record breaker, numbering 2,055, and the total number of visitors.

The quality of the dogs of all breeds, taken as a whole, was noticeably good.

Sporting dogs showed a gain for the better, as to good physique, type and general character.

Foxhounds had a light entry. In the class for English dogs, there were but two, Songster and Gambler, the former a winner in the past, and the better of the two. Roxana was alone, and out of condition somewhat. There were four in the open class for American foxhounds, dogs, and of these Regal, a good dog with a trace of English cross, won first, and Dandy, a good dog, though somewhat light behind, won second, third going to Grant, open in feet and not so well made nor so good in foxhound character as the reserve, Walt, the latter a bit flat in ribs and plain in head. The open bitch class had three entries. Veracity, a well-known winner, took first, though not in the best of condition. Carmen, a small, tidily built bitch, took second.

Chesapeake Bay dogs had but one class, which was for both dogs and bitches, and there were five entries. It is to be regretted that this sterling working dog has not better support from sportsmen. With an exception, Bret, they were all owned by Mr. T. J. Chapple. Pride III. was in the best coat, and was quite a fair specimen. Sailor, second, was out of coat, while Bret, third, was very closely pressed by Duchess, reserve.

Pointers were good as to general quality. The class for puppies, dogs and bitches had fifteen competitors. First went to Fairview Miss, a smoothly tiered pointer well made, standing well on legs and good in shoulders, head and back. Second was won by Fairview Mike, quite a good dog, though out somewhat at elbows. Furlough Daphne won third. She is lacking yet in the necessary development which come with age, and stand higher on legs than could be wished. Urada's Belle, fair in merit, took reserve. There were eighteen in the novice class for dogs. First went to a gaiter, little built pointer, Roswell's Bang, a muscular dog, whose worst fault is his markings. Second went to King William, a well shaped dog, good in head and general symmetry. Fairview Lad, third, might be better in stifles, and general make up. Naso Bang, quite a good pointer, was unnoticed. There were twenty-four entries in the limit class for dogs. Roswell's Bang won again, with King William again second, with Brighton Joe third. There were twelve entries in the class for limit dogs, 55lbs. and over. Princes' Lad, first, was in fine condition. He had some good previous wins to his credit. Dutch, second, has a coarse tail, which he carries too gayly. He was not in the best of condition. King of Lynn, third, was an ordinary good dog, not the equal of Lad of Bang, the reserve. In open dogs, under 55lbs., there were five entries. Shotaway, first, has a well turned muscular body, a short weak muzzle, which spoils the outline of his head, and his general symmetry is imperfect. He looked very large for under 55lbs. Roswell's Bang, second, taken all in all, far surpasses him in merit. Open dogs, 55lbs. and over, had nine entries. First went to the well-known Sir Walter, shown in good condition, and second went to the equally well-known Lad of Kent, a winner of many firsts, but now showing age, as is to be expected when a dog is near his eleventh year. Novice bitches had twelve entries. Fairview Miss was first. Gyp Winslow, second, is throaty, and Bella, third, is light in bone, and somewhat laggy. In the limit class for bitches under 50lbs., Fay Templeton, a well made bitch, though somewhat throaty, took first. In the limit class for bitches under 50lbs., Furlough Bloom, a winner at the New York show last year, took first. She is somewhat swaybacked. Second went to Belle Westlake, not in the best of condition. She stands on good legs and feet, and is a good bitch generally. Daisy Belle, third, was not in good flesh. Bitches, open class under 50lbs., had four entries, and of these Brighton Flossie was absent. Fairview Meally, first, was fat, and rounded out too much, though she has good legs and feet, and a plain head. Devonshire Pearl, second, a former winner, was in good condition, though Kent's Kate, third, also a former winner, far surpassed her in having better legs, feet, quarters, head and general symmetry. There were three entries in the class for bitches 50lbs. and over. Urada was first easily; Fairview Flip, second, and Alice Leslie was third. In the team class for the best exhibit of four, W. Gould Brokaw's team won. Sir Walter took the prize for best pointer in the show. George S. Mott won the President's Challenge Breeder's Cup.

English setters were of good quality. There were fourteen in the class for puppies, dogs and bitches. Two were absent. Dewey Rogers, first, is a puppy far above the ordinary merit of puppy winners. He moves well, is substantially built, has a good head, body, legs and feet, and good general symmetry. Countess Zoe III, light in bone and lacking substance, took second. Reserve went to a fairly good bitch, Kalmia Susie. Novice dogs had seventeen entries. Tang, first, was shown in good condition. He has superior legs and feet, and carries himself well. Rock Furness, second, was not in the best of coat.

He has a short neck, plain head, and is a good average dog. Peter Sterling, third, was quite ordinary, and was easily surpassed by Alberton, the reserve. There were sixteen in the limit class for dogs. Albert's Woodcock, first, is not a first rater. Gilhooly, second, is quite a sound dog, symmetrical, and better in make up than the winner of first. Orangeman, third, is weak in muzzle, poor in head, but has a well made body. Tang was reserve, and was very close in merit for third place. There were thirteen entries in the open dog class, of which Rodrigo Ned was an absentee. First went to Albert's Woodcock. Novice bitches had ten entries. Sal English, first, was not in good condition. Her head is faulty, and she is light behind. Maida Freya, second, is faulty in head, and too much spring of rib. Royal Blue Belle, third, has a poor head, but is fairly good otherwise. Miss Mischief, unnoticed, was well worthy of recognition. In limit bitches there were eleven starters. Albert's Spectre, first, was in good condition. Second went to Sal English, while third went to Flower of Sulphur, not shown in the best of condition. Comtesse Bijou, reserve, is a bitch of merit. In the open bitch class there were twelve entries. Ruby D. III., good in head, won first; her condition might have been better. Albert's Spectre was second, while third went to Flower of Sulphur. The Warwick Kennels' team won in the team class. The special prize for the best English setter puppy went to Dewey Rogers.

Irish setters were a good lot. In novice dogs there were fourteen entries. Hunter, first, was in good condition. He is rather slack built. His color is good. King, second, was shown too fat. O'Shaughnessy, third, is a well made large dog, of good symmetry, though coarse in head. Shaugran, reserve, is a commendably good dog. In limit dogs there were eleven. First was won by Shamrock O'More, a snugly built dog of good head color and symmetry. Fred Elcho, second, is a finely made dog, and made a good competition for first, while third went to Hunter. There were twelve in the open dog class. The old winner, Kildare, was out of condition and unnoticed. In novice bitches there were five. Lorna Doone III., a well made handsome bitch with a plain head, took first, second going to Red Rose II., somewhat out of condition. She has a good head, and fair symmetry. Kildare Annette, third, was in good condition, and is quite a sound bitch. In limit bitches, there were five entries, and in the open bitch class there were two, of which Queen Vic, a famous winner, took first, and Blanche Farnmore, shown in better condition, took second.

Gordon setters averaged about as usual. J. R. Oughton had the most and the best entries, and aside from his kennel, the dogs were rather inferior. There were four in novice dogs. Dwight Lad II., first, was thin in flesh, fairly well built, and good in color and markings. Brandy, third, had the best head, though not the best on coat, the latter being curly. In limit dogs there were four entries. Dwight Lad II., first, was in good condition. Black Chief, third, was ordinary. There were four in open dogs. Heather Lad, first, is a well-known winner. Dwight Grouse, second, is exceedingly throaty, while Don B., third, was a well made dog easily better than second. There were three entries in novice bitches. Elmont Clinton, first, had poor tan, and a head not well shaped. Second went to Jim's III., out of condition, but good in head. Orphan Gordon, third, was very commonplace. In limit bitches there were five entries. Lady Maud, first, was too fat, though fairly good in make up. Second went to Heather Beulah, out of condition, and third to Dwight Pleasure, shown in better condition. Of the five in the open bitch class, Lady Gordon, first, was shown too fat, and Dwight Minnie, second, was in poor condition.

Irish water spaniels had but three competitors. Dan McCarthy, first, was the best dog in type, etc., Mollie C. and Venus winning second and third.

Beagles were a remarkably good even lot. The three winners in the puppy class, eleven entries, were good ones.

In novice dogs, ten entries, Private, first, is a tidily built, sound, all-round beagle. Foreman, second, is somewhat long cast, and loses to the winner in general physique. Limit dogs not exceeding 13in., had four entries, first going to Orator, second to Plausible, a sound dog, though heavy in shoulders, and third to Royal Dot, long in body and light in bone. There were seven in novice bitches. Reed's Nancy, first, has good legs, head, feet, and is a fairly good bitch. Cinderella, second, is faulty in hocks, is too wide in ribs and broad in chest. Blue Grass Girl, third, is quite a good beagle. Limit bitches, not exceeding 13in., had seven entries. Reed's Nancy was first. She is a very superior bitch.

LIST OF AWARDS.

FOXHOUNDS.—English.—Open Classes.—Dogs: 1st, A. B. McGregor's Songster; 2d, J. Gibbs' Gambler. Bitches: 1st, Harding Bros.' Roxana. American.—Open Classes.—Dogs: 1st, J. Gibbs' Regal; 2d, A. B. McGregor's Dandy; 3d, W. H. McGarry's Grant. Res.: Thornley Martin's Walt. Bitches: 1st, J. Gibbs' Veracity; 2d, N. T. Harris' Carmen; 3d, E. B. Chase's Trifle.

CHESAPEAKE BAY DOGS.—Open Classes.—Dogs and bitches: 1st, 2d and res., T. H. Chapple's Pride III., Sailor and Duchess; 3d, H. McAllister's Bret.

POINTERS.—Puppies.—Dogs and bitches: 1st and 2d, W. Gould Brokaw's Fairview Miss and Fairview Mike; 3d, G. J. Gould's Furlough Daphne. Res., D. J. C. Raymond's Urada's Belle. Novice.—Dogs: 1st, H. W. Richardson, Jr.'s Roswell Bang; 2d, Geo. S. Mott's King William; 3d, W. Gould Brokaw's Fairview Lad. Res., C. H. Mackay. Limit dogs, under 55lbs.: 1st, H. W. Richardson's Roswell Bang; 2d, Geo. S. Mott's King William; 3d, W. H. Hutchinson's Brighton Joe. Res., W. Gould Brokaw's Fairview Lad. Limit dogs, 55lbs. and over: 1st, Geo. S. Mott's Princes' Lad; 2d, E. K. Caviler's Dutch; 3d, Robert Leslie's King of Lynn. Res., R. E. Westlake's Lad of Bang. Open.—Dogs, under 55lbs.: 1st, Geo. W. Lovell's Shotaway; 2d, H. W. Hutchinson, Jr.'s Roswell's Bang; 3d, W. H. Hutchinson's Brighton Joe. Res., C. E. Bussing's Fairview Priam. Open dogs, 55lbs. and over: 1st and 3d, W. Gould Brokaw's Sir Walter and Prince Boy; 2d, Geo. Jarvis's Lad of Kent. Res., Geo. S. Mott's Princes' Lad. Novice.—Bitches: 1st, W. Gould Brokaw's Fairview Ruth; 2d, R. E. Westlake's Gyp Winslow; 3d, A. Russell's Bella. Res., A. Spring's Bell. Limit bitches, under 50lbs.: 1st, C. H. Mackay's Fay Templeton; 2d, R. E. Westlake's Westlake's Startle; 3d, W. Gould Brokaw's Fairview Miss. Res., F. J. Lenoir's Tony Maid. Limit bitches, 50lbs. and over: 1st, Geo. J. Gould's Furlough Bloom; 2d, Blyth and Westlake's Belle Westlake; 3d, Wm. Heil's Daisy Belle. Res., W. Gould Brokaw's Fairview Thelma. Open.—Bitches, under 50lbs.: 1st, Wilcox & Burtis' Fairview Neally; 2d, Geo. J. Gould's Devonshire Pearl; 3d, T. J. Lenoir's Kent's Kate. Open.—Bitches, 50lbs. and over: 1st, F. J. Lenoir's Urada; 2d, C. P. Wilcox's Fairview Flip; 3d, C. H. Mackay's Alice Leslie.

ENGLISH SETTERS.—Puppies.—Dogs and bitches: 1st, Geo. Battison's Dewey Rogers; 2d, John H. Parry's Countess Zoe III.; 3d, A. R. Stern's Nigie S. Res., Kalmia Kennels' Kalmia Susie. Novice.—Dogs: 1st, H. Dawson's Tang; 2d, F. E. Conlon's Rock Furness; 3d, F. G. Taylor's Peter Sterling. Res., Warwick Kennels' Alberton. Limit dogs: 1st, Warwick Kennels' Albert's Woodcock; 2d, C. J. Caylor's Gilhooly; 3d, John Brett's Orange-

man. Res., H. Dawson's Tang. Open—Dogs: 1st, Warwick Kennels' Albert's Woodcock; 3d, John Brett's Orangeman. Res., H. Dawson's Tang. Novice—Bitches: 1st, S. W. Carey, Jr.'s Sal English; 2d, V. Hansen's Maida Freda; 3d, F. H. Von Waffenstein's Royal Blue Bella. Res., Warwick Kennels' Constance. Limit bitches: 1st, Warwick Kennels' Albert's Spectre; 2d, S. W. Carey, Jr.'s Sal English; 3d, John Brett's Flower of Sulphur. Res., F. H. Von Waffenstein. Open—Bitches: 1st, J. E. Borden's Ruby D. III.; 2d, Warwick Kennels' Albert's Spectre; 3d, John Brett's Flower of Sulphur. Res., F. H. Von Waffenstein's Comtesse Bijou. Team class: 1st, Warwick Kennels.

IRISH SETTERS.—Novice—Dogs: 1st, P. F. O'Neill's Hunter; 2d, M. E. Granger's King; 3d, G. Shippen's O'Shaughnessy. Res., F. G. Goodridge's Shaugran. Limit dogs: 1st, G. Shippen's Shamrock O'More; 2d, Dr. J. S. Lacock's Fred Elcho; 3d, P. F. O'Neill's Hunter. Res., J. W. Ogden's Dakin. Open—Dogs: 1st, G. Shippen's Shamrock O'More; 2d, Dr. J. S. Lacock's Fred Elcho; 3d, P. F. O'Neill's Hunter. Res., F. G. Goodridge's Shaugran. Novice—Bitches: 1st, W. W. Kendall's Lorna Doone III.; 2d, Joe Lewis' Red Rose II.; 3d, G. Shippen's Kildare Annette. Res., Henry Jarrett's Lustre. Limit bitches: 1st, H. F. Van Zandt's Biddy Finglas; 2d, W. W. Kendall's Lorna Doone III.; 3d, Woodbury Kennels' Kildare Hope. Res., H. D. Ogden's Mollie Gibson. Open—Bitches: 1st, Joe Lewis' Queen Vic; 2d, J. W. Ogden's Blanche Finmore. Team class: 1st, Woodbury Kennels' team.

GORDON SETTERS.—Novice—Dogs: 1st, J. R. Oughton's Dwight's Lad II.; 2d, C. J. Renmont; 3d, A. W. & C. R. Swain's Brandy. Res., F. S. Van Nostrand's Rex V. Limit dogs: 1st, J. R. Oughton's Dwight's Lad II.; 3d, H. A. Smith's Black Chief. Open—Dogs: 1st and 2d, J. R. Oughton's Heather Lad and Dwight Grouse; 3d, Thos. M. Gollin's Don B. Res., Miss S. A. Nickerson's Count Noble. Novice—Bitches: 1st, W. G. Kugler's Elmont Clinton; 2d, C. J. Reynolds' Juno III.; 3d, A. W. & C. R. Swain's Orphan Gordon. Limit bitches: 1st, Miss S. A. Nickerson's Lady Maud; 2d and 3d, J. R. Oughton's Heather Beulah and Dwight Pleasure. Res., C. E. Squires' Lassie. Open—Bitches: 1st, John Graham's Lady Gordon; 2d and 3d, J. R. Oughton's Dwight Minnie and Dwight Pleasure. Res., Miss S. A. Nickerson's Janet Noble. Team class: 1st, J. R. Oughton's team.

IRISH WATER SPANIELS.—Open—Dogs and bitches: 1st and 2d, T. A. Carson's Dan McCarthy and Mollie C.; 3d, Mrs. D. W. Evans' Venus.

BEAGLES.—Puppies—Dogs and bitches: 1st and 2d, Ridgewood Beagles' Whip and Huntsman; 3d and res., Geo. F. Reed's Reed's Dewey and Reed's Nancy. Novice—Dogs: 1st and 2d, Hempstead Beagles' Primate and Foreman; 3d, Waldingfield Beagles' Orator. Res., Geo. F. Reed's Reed's Dewey. Limit dogs, not exceeding 13in.: 1st, Waldingfield Beagles' Orator; 2d, A. D. Lewis' Plausible; 3d, H. Fitzsimmons' Royal Dot. Limit dogs, over 13in. and not exceeding 15in.: 1st, Howard Almy's Blitz; 2d and 3d, Hempstead Beagles' Primate and Foreman. Res., Wm. Saxby's Turpin. Open—Dogs: 1st and 2d, Hempstead Beagles' Primate and Foreman; 3d, Wm. Saxby's Turpin. Res., Ridgewood Beagles' Fiddler. Novice—Bitches: 1st, G. F. Reed's Reed's Nancy; 2d, the Wharton Beagles' Cinderella; 3d, R. L. Bohannon, M. D.'s Blue Grass Girl. Res., Hempstead Beagles' Beautiful. Limit bitches, not exceeding 13in.: 1st, Howard Fitzsimmons' Flossie F.; 2d, Samuel E. Thurton's Topsy O.; 3d, R. L. Bohannon, M. D.'s Blue Grass Girl. Res., H. L. Kreuder's Countess of Rockland. Open—Bitches: 1st, Hempstead Beagles' Oronsay Matron; 2d, S. E. Thurton's Topsy O. Field trial class: 1st, Howard Almy's Blitz; 2d, Hempstead Beagles' Nimrod; 3d, Waldingfield Beagles' Orator. The National Beagle Club's Produce Stakes, 1st and res., Hempstead Beagles' Foreman and Beautiful; 2d, A. D. Lewis' Plausible; 3d, Wharton Beagles' Wharton Champion. Team class: 1st, Ridgewood Beagles.

A. K. C. Meeting.

THE annual meeting of the American Kennel Club was held at Madison Square Garden Wednesday, Feb. 22, at 2 P. M., Vice-President Edw. Brooks presiding. The following members were present: Baltimore Kennel Association, Wm. P. Riggs; Butterfly Bench Show Association, Dudley E. Waters; Collie Club of America, Jas. B. Watson; Gordon Setter Club of America, Jas. B. Blossom; Irish Terrier Club of America, S. Van Schaick; Mascoutah K. C., C. F. R. Drake; National Beagle Club, H. F. Schallhass; New England K. C., Edw. Brooks; Rhode Island K. C., W. C. Codman; San Francisco K. C., C. B. Knocker; Western Pennsylvania K. C., G. M. Carnochan.

Officers and delegates of the Associate members for the year ending February, 1900, were elected as follows: President, H. H. Hunnewell, Jr.; Vice-President, Winthrop Rutherford; Secretary, Fredk. S. Stedman; Delegates, (1) A. C. Wilmerding, (2) H. K. Bloodgood; (3) G. W. H. Ritchie.

The following were elected officers of the American Kennel Club for the year ending February, 1900: President, August Belmont; Vice-President, Edw. Brooks. Standing committees: Stud Book—Marcel A. Viti, chairman; H. F. Schellhass and C. B. Knocker. Field Trials and Coursing Meetings—H. F. Schellhass, chairman; L. C. Whiton, H. S. Joslin and J. F. Van Dorn. Constitution and Rules—H. K. Bloodgood, chairman; Jas. Watson, H. F. Schellhass, Q. W. H. Ritchie and A. P. Vredenburg. Finance—A. C. Wilmerding, chairman; J. B. Blossom and G. M. Carnochan. Membership—H. T. Foote, chairman; S. Van Schaick and C. B. Knocker.

The treasurer's report showed a balance on hand of \$6,502.72, a very satisfactory state of affairs.

The following clubs, being in arrears for dues for the year 1899, were ordered to forfeit all right to representation in the association, and are liable to suspension or to be dropped from the roll of membership without further notice: Bloodhound Club of America, California Collie Club, California State Poultry and Kennel Association, Cedar Rapids K. C., Columbus Fanciers' Club, National Greyhound Club, Northwestern K. C., Oakland K. C., Pacific Fox Terrier Club, Philadelphia K. C., Santa Clara Valley Poultry and K. C., and Wilmington K. C.

The resignations of the Pointer Club of California and the American Pug Club were accepted. In the case of Frank Kruse vs. Klee and Dean it was ordered that Klee and Dean be suspended by default. The case may be reopened upon appeal by the defendants.

Article IV. of the rules provided that a delegate could be elected by a majority vote and the acceptance could be withdrawn by a two-thirds vote. This was changed to make each vote a three-quarter vote, and such acceptance may be withdrawn by a three-quarter vote by a ballot in any meeting of the association. An amendment was made to Article XII., Section 5, making it read: "Any person who is proved to the satisfaction of the board to have been guilty of fraudulent or discreditable conduct of any kind, may be suspended or disqualified; in either case such person is ineligible to make entries at or to compete or win a prize at any show under the rules of the association during the term of said suspension or disqualification, and shall during the term of his suspension or disqualification be deprived of all privileges of this association."

An amendment was passed to strike out the entire section 4 and substitute the following: "There shall be an advisory committee on the Pacific Coast, with headquarters at San Francisco, Cal., to be appointed by the presi-

dent of this association, or, in his absence, by the vice-president; said committee shall act under a code of rules as adopted by the executive board."

The listing rule was amended so that listings are now only good until Dec. 31 if the year in which dogs are listed.

Rule 19 was amended to read: "No premium list is to be considered as indorsed unless it has at the head of the classification an official notice of such indorsement, signed by the secretary of the American Kennel Club."

The proof or manuscript of premium lists must be sent to the American Kennel Club and receive indorsement before lists are printed and distributed.

The following amendment was accepted: "It shall be the duty of dog show officials to bench all dogs of a breed together when owned and entered by one exhibitor, provided a request for same be entered on the entry form."

The Pacific Coast special committee of the American Kennel Club, in the matter of the Collie Club of California, California State Kennel and Poultry Association and Santa Clara Valley Poultry and Kennel Association, for holding membership in the American Kennel Club and also forming a connection by membership with the Pacific Kennel League, reported that no action should be taken in the matter, and that the Pacific Kennel League and these clubs should be treated as any individual organization that sought to give shows under its own rules. The Pacific Kennel League, or its existence, the committee reported, is not of sufficient importance to deserve even passing notice. It does not, even as a matter of pretence, represent substantial opposition or hostility to the American Kennel Club.

A protest was read from the Rhode Island K. C. against the American Kennel Club holding them fast to the date of closing of entries as announced in the premium list. They thought that the dates of closing should be entirely in the hands of the committee of the show, with the power to extend such dates, if necessary, provided same is announced in the papers. The protest was laid on the table.

The claim of the Mascoutah K. C. to have returned to them their forfeit of \$25, which they lost two years ago for violation of rules, was not recognized.

Because of the action of the American Field in publishing a report of the advisory board before its reception by the club, it was voted that it is the sense of the American Kennel Club that any committees which may have reports to make, or which may have made any report to the American Kennel Club shall, so far as they themselves are concerned, consider such reports strictly confidential, and that the American Kennel Club should be the only medium by which they should be made public.

The credentials of G. M. Carnochan and Norvin T. Harris to act as delegates at this meeting were accepted.

The Rhode Island State Fair Association and the Bloomington K. C. were elected to membership in the American Kennel Club.

With the consent of a majority of the executive board the American Kennel Club has removed from its old offices on the third floor of 55 Liberty street, and has taken a lease for a suite of offices on the fourth floor. It is the most convenient and best set of offices the American Kennel Club has ever had. The secretary was empowered to make such purchases of furniture and fixtures as he required in the office.

Continental Field Trial Club.

HILLSBORO, N. C., Feb. 25.—*Editor Forest and Stream:* The Continental Field Trial Club held its annual meeting on Wednesday, Feb. 22, at Madison Square Garden, Hobart Ames, Jr., president, in the chair. The following gentlemen were elected members of the club: E. M. Weld, Boston, Mass.; George L. Thomas, Montclair, N. J.; W. Gould Brokaw, New York, and G. F. Nesbitt, Wilkesbarre, Pa.

The Eastern Field Trial Club extended an invitation to the Continental Club to hold their trials this year on their grounds at Newton, N. C. The Continental accepted the invitation, and will hold the trials at Newton, N. C., commencing with the Members' Stakes, Friday, Dec. 8, 1899. The open stakes will commence with the Derby, Monday, Dec. 11, followed by the All-Age and the Sweepstakes. The prizes and conditions will be the same as in last year's trials. The Members' Stakes, a new feature, will be a sweepstake of \$10 for each entry, and is open to members of the Eastern Field Trial Club. Suitable cups will be given by members for winners of first, second and third. Every one is very much interested in this stake, and it will be strongly contested. A suitable diploma will be given at this year's trials to each winning dog in the open stakes. The committee appointed at the club's last meeting presented the names of Simon C. Bradley, Edmund H. Osthaus and Irving Hoagland as judges for this year's trials; these gentlemen were unanimously accepted, and will judge at Newton for the Continental Club. The club's meeting was a full and enthusiastic one. Its financial condition is good, showing all debts paid and a balance in the treasury.

W. B. MEARES, Sec'y and Treas.

Irish Setter Club.

PHILADELPHIA, Feb. 24.—The annual meeting of the Irish Setter Club of America was held at the Madison Square Garden, New York, on Feb. 22, the president, Dr. G. G. Davis, in the chair.

Present: Messrs. Davis, Blossom, Sutton, Shippen, Clements, Bullock and Thomson, and by proxy, Miss G. Shippen and F. G. Goodridge.

The minutes of the previous meeting were read and approved. The treasurer's report, showing a balance of \$188.96, was read and approved. It was decided to offer \$50 at bench shows and \$50 at field trials during the ensuing year, the manner of offering the same to be left to the executive committee.

It was voted that the executive committee be empowered to select a list of judges for bench shows, from which a judge may be chosen, and to forward this list to the various bench-show committees.

Dr. William Jarvis, of Claremont, N. H., was elected an honorary member. Mrs. W. Sutton, R. D. Sutton and

Alfred Remsen, all of New York, were elected members of the club.

The following gentlemen were then elected to serve during the ensuing year: President, Dr. G. G. Davis, Philadelphia; Vice-President, James B. Blossom, New York; Secretary and Treasurer, George H. Thomson, Philadelphia. Executive Committee: William Shippen, F. G. Goodridge, Woodruff Sutton, J. Maxwell Bullock, Robert H. McCurdy and B. L. Clements. There being no further business, the meeting adjourned.

GEO. H. THOMSON, Sec'y.

Yachting.

As the yachting journal of America, the *FOREST AND STREAM* is the recognized medium of communication between the maker of yachtsmen's supplies and the yachting public. Its value for advertising has been demonstrated by patrons who have employed its columns continuously for years.

Gasolene Engines and Launches.—II.

BY F. K. GRAIN.

(Continued from page 188, Feb. 18.)

HEATERS.—The majority of gasolene motors are supplied with a heater, which consists of an air chamber placed around the exhaust pipe, the use of which is to supply hot air to the vaporizer. It not only helps to vaporize the gasolene, but keeps the vaporizer or carburetor warm. Right here let me state that the act of vaporizing or generating the gas through the mixing of air and gasolene, by means of a vacuum of any degree, creates an intense cold; in fact, there are many of the vaporizers and carburetors that if used without a heater will freeze. All carburetors absolutely require a heater.

MUFFLERS.—Mufflers are supplied to deaden or diminish the sound made by the exhaust gases, which in many motors, especially those of the two cycle type, is very loud and disagreeable. They are made in many different forms, some consisting of a large section of pipe, into which the exhaust passes from the motor and thence out, the pipe having several diaphragms of perforated metal, which act as checks to the sudden exit of the exhaust. Again others are made like a pot, which acts as a receiver, and from which the exhaust is let out from several pipes, thereby dividing up the pressure.

After a great deal of experimenting the writer has found that by far the best and cheapest form of muffler is a section of pipe five times the diameter of the exhaust pipe and seven times the length of the stroke of the motor, filled with coke or pumice stone broken up into pieces about the size of an egg. There must be a head on each end of the pipe tapped to fit the exhaust pipe, and inside of these heads a coarse piece of wire strainer netting to prevent the escape of any pieces of the filling into the pipes.

In cases where it is possible I advise allowing the exhaust to pass up and out overhead in preference to putting it out through the side or under counter of boat. This style of muffler can have a brass jacket and be so placed as to look like a short smoke stack. It is the usual practice to put the mufflers under a locker or under the after deck. This, however, makes a great amount of heat in the boat, which is neither good for the hull nor pleasant for the occupants. We therefore recommend its running up and out the shortest possible way.

There are some who exhaust under water, but unless a special device is used it creates a back pressure or chokes the exhaust, which retards the motor. In a sea-way or under certain conditions of trimming of the boat, it will make a very unpleasant noise, and taking it all through it can hardly be called a success.

ELECTRIC SPARK BATTERIES.—We now come to the use of batteries for creating the firing spark. The form of battery used is what is known as the open circuit type, such as is employed in telephone, signal and bell service; also for small motors and medical instruments, and it is not to be confounded with the gravity battery used on telegraph lines. One drawback to the use of electricity for igniting gas or gasolene motors has been that the makers of batteries, until quite a recent date, have made no effort to supply an article exactly suited to this line of work; but the case is now different, there being some excellent batteries made for this special work. They are mostly of two kinds, the sal-ammoniac and the caustic soda. The former consists of a jar made of either glass or porcelain, with suitable top containing the elements, which are a zinc and carbon suspended in a solution of water and sal-ammoniac. The other is a jar of either glass, porcelain or steel containing a zinc forming the negative pole, and black oxide of copper for the positive, suspended in a solution of water and caustic potash, called by some electro-sodium, paraffine oil being poured on top to prevent evaporation and creeping of the salts.

The first-named battery has some points that highly recommend it for marine work. The solution, in the first place, is harmless and will not injure the hands, clothes or the boat in case of being upset; it is also cheap and can be had at almost any drug store, the cost of recharging is very little, and it can be done in a few minutes.

With the caustic soda battery the case is, however, different, as the soda will hurt the hands, clothes and shoes, to say nothing of paint on motor or boat. It is expensive to recharge, but, on the other hand, is very strong and long-lived, and will without doubt stand more hard and continuous service than the former.

Besides these, there are many different forms of acid batteries, which, although powerful, are not adapted to motor work. In the first two batteries there is no internal action while the battery is out of use; but with the acid batteries there is a constant deterioration of the elements. In connection with the batteries there is always used a spark coil, which consists of a core composed of iron wires, around which there are wound a number of layers of insulated copper wire. The action of the spark coil is to gather up the current and intensify same.

ECONOMY.—As regards the relative economy of the

two and four-cycle motor, there is no question but that theoretically the four-cycle has the preference, the superiority claimed consisting, first, that the motor requires a charge only every other stroke; secondly, that between each working stroke there takes place a thorough clearing of the cylinder, so that when the charge of gas enters there remains no part or trace of the burnt gases from the last charge, which it is claimed, and quite rightly, weakens the new charge. Now, with the two-cycle motor, which has an impulse of the piston each revolution, part of the fresh gas escapes with the exhaust of the burnt gas in the operation of expelling the old charge, and there is, notwithstanding, more or less of the burnt gas that remains to weaken the fresh charge. On the other hand, having an impulse at each revolution, the area of the cylinder does not have to be as great; therefore there is not so much gas required to make a charge. There being an impulse each revolution, the diameter and weight of fly-wheel is also much less in this type, as it has no idle revolution to overcome, which in turn takes less power to maintain the desired speed or momentum. Taking it all in all, a saving of a few cents per day should hardly be taken into consideration in any launch motor, the cost of operation being so small in any case, and most certainly not to be considered in comparison with the first cost.

DANGER OF NAPHTHA.—The question is often asked, Why is naphtha, gasoline or in fact any of the hydro-carbon oil so dangerous; and if so, how is it the use of these oils is steadily increasing? There are many liquids in common daily use that are equally as dangerous, if not more so, but as we have from long use become accustomed to handling them with a knowledge of their properties, we do not give them a thought.

To begin with, the first thing is to impress the novice in the use of hydro-carbons that it is not the liquid that is to be feared, but the gas formed by evaporation charging the air with a highly explosive mixture.

Likewise, few people know that, unlike many other gases in common use, the gas thus formed is heavier than the atmosphere; therefore will not rise, and for that reason does not as readily disperse itself, and will remain in a dangerous state in places and receptacles long after expected.

A tankful of gasoline can be set on fire and will, of course, burn fiercely, like all oil, but will not explode. Take this same tank, however, and put in a small quantity and disturb it so that the air in the tank will become charged, and you will have a highly explosive mixture. We have often heard people remark that they feared a large tank full of naphtha, where it should be the empty one to be afraid of.

The gas formed by the mixture of air and naphtha is explosive with from twelve to forty-five parts of air to naphtha, thirty-three being about its most explosive point; below twelve and above forty-five the gas will burn, but not explode. Naphtha and gasoline are alike, except that many vary a few degrees in their test; but in most cases what is called gasoline is generally of a grade somewhat lighter and more volatile than the grades of naphtha in common use.

STEAM AND ELECTRIC MOTORS.—The steam engine has been so completely supplanted by the various naphtha and gasoline motors that it is hardly a factor to be considered as a power for anything but large yachts or very high speed launches, and therefore does not come under the scope of this book.

There is no question nor doubt but that the electric motor is the ideal launch power, but as yet they are in a very crude state, and are dependent on an independent plant to recharge their storage batteries, which at the best will only run at full speed for a comparatively short time, to say nothing of the great weight of the batteries that it is necessary to carry. They are in use by some of the large steam yachts as tenders, but in their present state of development are unsuited to common use.

NAPHTHA, ALCO AND AMMONIA MOTORS.—There are also what are commonly called "naphtha motors," which, with the alco and ammonia vapor motors, should properly be classed with the steam engine, as by these systems the naphtha, alcohol or ammonia is brought to a boiling point in a retort or boiler by means of a naphtha, kerosene or other oil fire, the results being that the fuel in the retort generates steam or gas which is admitted to an engine of varying form, and after passing through the engine is then condensed and returned to the retort, the principles of these motors being identical with the ordinary steam engine.

PROPELLERS.—Next we come to the propeller and the means of reversing the same. Although any motor of the two-cycle type can be fitted to reverse, it is not so with the four-cycle. Owing to motors having no power to speak of on a start from a standstill, and for other reasons, it has been found by far the best plan to keep them running the one way, and to reverse either by means of gearing, friction clutch, or reversing the blades of the propeller. The first-named device is mostly to be found on motors of the four-cycle type, the builders of the two-cycle mostly all using the reversible bladed propeller. The geared and friction reversing mechanism is made in many different forms, but in fact the principle is really identical in all and includes only simple, well-known mechanical movements. The reversible bladed wheel consists of a hub, into which the blades are fastened so that by means of a sleeve surrounding the shaft and fastened to an idler, which engages an arm or bearing point on the blade, causes the blade to turn on its axis in the hub. The sleeve revolves with the shaft and is moved backward and forward by means of a lever located in most cases near or on the motor, although it can be arranged to work from any part of the boat. These reversing wheels are mostly very simple, strong and effective, and we think they are the ideal reversing method for all kinds of motors. They should, however, be made in all their parts of best hard bronze. While on the subject, it may be said that it is almost always a surprise to the novice in motor construction at the smallness of diameter of the wheels used on them. This is owing to the fact that it has been found to give better results to make the wheels small and increase thereby the revolutions of the motors, adding power to the motor and lessening the vibration.

CHOICE OF MOTORS.—We will now suppose you are in the market for a motor, or a launch ready equipped,

and, as in many cases, you are undecided as to the make of motor you will select.

POINTS IN CONSTRUCTION.—Now, what are the points in construction you should consider? To begin with, by all means buy of a reliable firm, and as near your home as possible, for no matter how well or carefully it is made, there is always the liability of a break-down or repairs on account of wear. Look over the working drawings of the makers and insist that they shall show sufficient thickness of the cylinder to allow of its being re-bored at least twice without its being too thin for safety. There should be a clearance space of one-third of the length of the stroke between the piston when it is on the upper center and the top of cylinder. The connecting rod should be, from center of the wrist-pin to center of the crank-pin, not less than twice the length of the stroke. The crank-shaft should be of forged steel (not cast) of good diameter, and the crank-pin should be of the same diameter as the crank-shaft. All bearings should be of hard bronze and as long as possible, remembering always that length of bearing does not increase friction. Be sure your motor is supplied with good grease and oil cups, and that the cylinder is fitted with a sight-feed lubricator that will feed heavy oil in cold weather without at first having to heat the lubricator to start it feeding. See that all parts of the vaporizer are of brass or bronze, and that all connections between the motor and wheel are of the same metal, excepting where the reversing is done by gears or clutches, in which case these parts will have to be made of cast iron or steel. Your motor should be run in the shop at least twenty hours on a belt and by its own power before you attempt to use it, as it is a great annoyance to attempt to break in a new motor, especially in a small boat. In buying a motor, it is like buying a suit of clothes; that is to say, if you want to get a first class article, you must pay a first class price, and we advise you in any case to either get the best or none at all. Study the catalogues, and when you find any one offering you something as good as the best at half price, be sure that it is, and then look for the list of extras—that generally explains matters. Do not let a few pounds in weight or an inch or two in height influence you, as in many cases what would be good serviceable motors are ruined by being built down too close.

The America Cup.

The work on the new cutter for the trial races is now progressing steadily at Bristol, and in spite of the efforts of the builders to maintain the most rigid secrecy, a great deal is already known about her. The "guessing contest" is a good deal easier than in the case of Defender four years ago, as the latter yacht was a very wide departure, both in design and construction, from her predecessors, Navahoe, Vigilant and Colonia. In the present case it was practically a foregone conclusion at the outset that any new 90-footer would be but an improvement in detail on Defender, and the guessing was limited to the exact dimensions and the material for the plating. The latter seems to be finally settled in favor of Tobin bronze instead of manganese bronze for the bottom, and nickel steel instead of aluminum for the top sides, as well as for the deck beams and some other of the upper structural members.

The most exact and reliable information thus far published is the following, by W. E. Robinson, in the Boston Globe of Feb. 27. It is, of course, not official, and we are not aware of the sources of Mr. Robinson's information, but we have sufficient confidence in his reliability and his technical knowledge to reprint it in the FOREST AND STREAM as the best information yet made public.

Whether or not the new America Cup defender, now building by the Herreshoffs at Bristol for Com. J. Pierpont Morgan and C. Oliver Iselin, will be faster than Defender of '95 is the most interesting yachting question at the present time. The question as to whether or not the chosen American defender will beat Shamrock will come up later. It is for an answer to the first question that information about the new boat has been so eagerly sought.

The Globe has from time to time given its readers the best possible information it could obtain in this direction. It now supplements it with dimensions and details of construction, which leave no doubt as to the manner and type of boat the new defender will be, and which enables the prediction to be safely made that she will be many minutes faster than Defender on almost every point of sailing and under almost every condition of racing wind and weather.

A few mistakes have been made in previous information, but in general the new boat has been outlined as an improved and more powerful Defender, and not as any radical departure from a type known to be fast, able and seaworthy. This conclusion is fully borne out by the additional information now given. The new boat is an improved Defender, with more power and sail, and yet with practically just as easy a form to drive and with all the lines for speed that made the champion of '95 a marvel. She will also be more lightly and yet more thoroughly built than Defender. Aluminum has been entirely discarded in her construction, and yet because of more careful attention to detail the absence of this lightest of all metals will not be missed.

The Globe has in its possession sufficient information to show not only these points, but also many others which would support and confirm them. Yet while it desires to give its readers all possible information, for an answer to the question as to the boat's speed, it by no means desires to give information of which the designer of Shamrock could take advantage to Herreshoff's disadvantage. Certain important things, such as the exact weight of the lead keel, the placing of the mast and the general idea of the sail plan are therefore withheld, as are also exact dimensions. These are important things to a designer, and with them he would have his opponent's boat to a certainty.

It is not the same with matters of construction, now that Shamrock is well under way. Designer Fife is not likely to modify his construction plans from anything he might learn from this side of the water. The Globe therefore gives the new boat very fully in this direction, for in it is

shown her lightness and strength as compared with Defender. General dimensions are only approximately given, and no attempt is made to give her lines to an inch or do more than to show what she will look like and wherein she will differ from Defender.

The new defender is 130ft. over all, 90ft. waterline, just over 24ft. beam and not over 20ft. draft, although very close to that figure. Defender was some 5 or 6ft. shorter over all, 89ft. waterline, and just over 23ft. beam. Her draft was close to 20ft. The new boat's keel plate, stem and sternpost are of cast bronze, the frames and deck beams of nickel steel, and her plating of Tobin bronze up to the waterline and nickel steel above. Defender was plated with manganese bronze below the water line and aluminum above. Most of her deck beams were of aluminum. A lead keel of 90 tons is sufficiently approximate for the purpose of this article.

In model the new boat is a nearer approach to the out-and-out fin keel type, as shown in the Herreshoff 30-footers, than was Defender. Wetted surface is cut to the last inch on the new boat, while the lead is carried lower, the body is made rounder and more powerful, and the whole form made easier to drive at high speed. Quickness in stays is also an improvement over Defender, although the latter whirled very quickly. The lead keel is shorter and deeper, and its form better for easy motion through the water.

Like Defender, the new boat is of the fin keel type in great cutting away of the forefoot and in having her lead keel bulb. Also, like Defender's her frames start from the keel plate on top of the lead keel, and although giving largely the effect and appearance of a plate fin, still retain the usual form of construction. The rudder is also hung on the stern post, and is not a balanced one clear of the fin, as in the smaller boats. In brief, the boats are close to fin keels in design, but not in construction.

Compared with Defender's the new boat's midship section shows a sharper hollow at the turn from the keel into the body of the boat, a flatter floor and a rounder side, with about 1ft. more beam. These differences in themselves show a more powerful and easily driven boat, as well as one that should be faster in reaching or down the wind. A faster reaching boat is what Mr. Iselin is confidently expecting, while it is a matter of record that Defender was not much faster in spinnaker work than Vigilant.

The sheer plan of the new boat shows a forefoot very much more cut away than Defender's, while the lateral plane is improved by having the keel straight on the bottom instead of "rockered." The rake of the sternpost is about the same in both boats—45 degrees.

The lead keel of the new boat is close to 30ft. long on top, where Defender's was 35. At its heel it is 6ft. deep, while forward, just before its bottom line turns upward, it is 7ft. 6in. From the heel forward the bottom of the keel is flat for about 20ft. The line then rounds upward in an easy curve to a straight line of about 5ft. on the forward end. The top of the keel is a straight line, but it is about 1½ft. higher forward than it is aft. The bottom of the keel is parallel with the waterline.

The top of the lead keel is 20in. wide at about a third of its length from the forward end. It rounds to a point forward and tapers to a width of 4in. at the after end. The widest portion of the keel is close to the bottom below the widest portion on top, and here the lead is 34in. through. The bottom is flat, and there is only a very small round up at the edges. The line of the section of the lead keel at its thickest part shows only a very slight inward curve as it goes upward to the top. In fact, the lead keel might well be described as a plate rather than a bulb, having its upper edge 20in. wide and its lower 34, with the corners slightly rounded. The fore and aft sweep of the lines of the lead is a very easy one, and the keel is much easier to drive through the water than the ordinary bulb.

Defender's lead keel was not so deep as this, was rounded up fore and aft and was decidedly bulb. The greatest thickness of lead was not so low down as in the new boat, and hence not quite so effective for power for carrying sail. The new boat shows much the same improvement as in the 46-footer Wasp over the famous Gloriana.

From the lead keel the stem of the new boat rises a few feet in an easy outward curve, and then takes almost a straight line to the waterline and a little beyond, when it again rises by an easy inward curve to meet the line of the deck. Defender's stem showed a curve on the long sweep upward that was about as much outside of a straight line as the new boat's is inside, and the resemblance of the new boat to the 30-footers is therefore all the more striking.

The new boat's overhang forward is longer than Defender's, and the upward turn of the stem from the waterline is therefore not so sharp.

The rudder of the new boat is set well under her and will run to the bottom of the lead. The after end of the lead has a groove molded in it to fit the round of the rudder post.

In construction, the new boat is on the same general plan as Defender, but has lighter plating, and much variation in the sizes of the frames and beams are heaviest amidships and grow smaller toward the ends of the boat. There are also improvements in details over Defender.

The new boat's keel plate is of cast bronze, ½in. in thickness, and having flanges on the edges 4in. in height. Cross webs of the same height are placed every 20in. on the plate, to which the floors and frames are riveted. Plate, flanges and webs are cast as one piece, so that the practical thickness of the plate is 4½in.

The plate was cast in three sections for convenience in casting. Both ends of the inner section and the inner ends of the other section have flanges 2½in. deep on the bottom, and these, as well as the upper flanges, are riveted together, making the plate practically a solid one, 30ft. long, 4½in. deep and 20in. wide at its widest portion, tapering to a point forward and to a width of about 4in. aft. Slots are cut across the top of the lead keel to admit the lower flanges where the sections are joined, so that the plate lies close to the lead for its whole length.

The lead keel is fastened to the keel plate by bronze large screws, 9½in. long and 1in. through. The screws have hexagonal heads, for which a special wrench is needed to screw them into the lead. There are two of these screws for every space in the keel plate, and they

are placed close to the webs and well toward the outside. To give the screwheads a better bearing, a $\frac{1}{2}$ in. collar is cast on the plate at each screwhole. Holes are bored in the lead a little smaller than the screws, so that the latter make their own threads as they are screwed home.

To give additional fastening for keeping the lead keel in place, the lower strake of plating will drop on the side of the keel 2 ft. aft and 3 ft. 6 in. forward, and be screwed to it by many long, bronze screws. There is an offset for this plate on the lead keel, so that plate and lead will be even on their outside surfaces. This, taken with the fact that the lead keel has thus far been shod with bronze plating only on the bottom, makes it look as though the keel were not to be wholly covered with bronze, as in Defender.

The bottom of the lead keel has been shod with Tobin bronze plating, 7-40 in. in thickness, and a very fine job has been made of it. The plating just covers the rounded edges of the keel and has its own upper edge rounded off smoothly. The plating rises a little higher forward, but does not cover all of the turn from the bottom into the forward edge. This shoeing of the lead keel protects it materially in case of grounding. It is fastened to the keel by bronze screws.

The rudder will have a post and frame of cast bronze and a covering of Tobin bronze. Stem and sternpost are riveted to the keel plate. The sternpost drops about 2 ft. below the top of the lead, an offset being made in the lead to receive it.

There are seventy-seven frames in the boat, spaced 20 in. on centers, which gives a total length between frame 1 and frame 77 of 128 ft. They are angle frames of nickel steel 3-16 in. in thickness and rolled with $\frac{1}{2}$ in. bulb on the web, or part of the angle which projects into the boat. There is a deck beam for every frame and it is of the same size as the frame to which it is fastened. Frames 1 to 12 are $2\frac{1}{2}$ in. on the web and $1\frac{1}{2}$ in. on the flange, or portion of the angle which lies against the plating. From 12 to 20 the frames are $3\frac{1}{4}$ by 2; from 20 to 45, $3\frac{1}{2}$ by 2; from 45 to 53, $3\frac{1}{4}$ by 2; from 53 to 60, 3 by 2, and from 60 to 77, $2\frac{1}{2}$ by $1\frac{1}{2}$.

The floors which connect and strengthen the frames at the bottom and are riveted to the keel plate, are of 7-40 in. bronze for a dozen frames amidships and of 7-40 in. nickel steel fore and aft with a few 6-40 in. at the extreme ends. Every alternate floor plate amidships is 12 in. deep. The others are half that depth and taper to 4 in. forward and 5 in. aft. All the floor plates are flanged on top with about 1 in. flange for additional strength.

For many of the frames there are tie plates at the point where the garboard of the ordinary boat would be. These tie plates are 24 in. deep amidships, tapering to 11 in. at the ends. They strengthen the frames at the point where they begin to curve outward to form the body of the boat. They are of 7-40 steel, flanged on the bottom with 1 in. flange.

The deck beams have a crown or rise in the center of 8 in. They are fastened to the frames by a single rivet, but are braced to them by a seven-fortieth nickel steel plate, 7 in. wide, set 2 ft. in on the beam and 2 ft. down on the frame, and riveted with three rivets at each end. The beams close to the mast have web plates of seven-fortieth nickel steel, 9 in. deep, riveted to them, thus giving much extra strength at a point of great strain.

Just at the turn of the bilge on either side runs a bilge stringer or keelson, a nickel steel bulbed angle, 3x2 in. Under the deck beams are two stringers of the same shape and size, and from bilge stringers to deck stringers are diagonal struts or braces. There are about eight of these on a side, and they are five frames apart. The outer deck stringer, or waterway plate, is of seven-fortieth nickel steel, 26 in. wide amidships and tapering to 24 in. at the end. The deck is also to be strapped above the deck beams with diagonal nickel steel strapping. The will be of yellow pine, bolted to steel brackets on the frames.

There will be seven strakes of plating. The plating up to the waterline will be of seven-fortieths Tobin bronze, the plates being about 15 ft. in length. Above the waterline the plating will be five-fortieths nickel steel. This is considerably thinner than the plating used on the Defender, but the extra strong construction of the frame of the boat should offset this and make the plating sufficiently strong. The Tobin bronze appears to be brighter and of a better quality than the ordinary Tobin bronze, and is believed to be some special manufacture. The plates are highly polished.

The plating will be in-and-out lap, as in Defender, with no sign of flanging on the inside. "Knuckle joint" work has evidently not been needed. The plates will be single riveted, except on the keel, where double riveting will be adopted. Bronze butt plates will be used on the bronze plating and steel on the steel, and the same is true of the rivets. All rivet holes are 15-32 in. and the rivets 7-16.

The measurement by fortieths of an inch seems an odd one, but is Herreshoff style, and can easily be figured by remembering that 5-40 is $\frac{1}{8}$ in. and 7-40 is $\frac{1}{4}$ in. less than 3-16.

The boat will have two light nickel steel bulkheads, one on frame 12 and one on frame 60, and there will be double frames at these points. Her interior finish will be of the lightest possible kind, as it was in Defender. Her bronze plating will be left in all its pristine brightness outside and in, while the nickel steel above it will be painted.

There are eighteen of the boat's frames on the keel plate and eight on the sternpost. Just what their numbers are the Globe knows, but does not propose to tell, since it gives too close information for the place of the under-water body. The numbers of the frames at the mast are also withheld, as giving too good a clew to the sail plan.

The Globe has not had access to the designer's drafting board, and would not use the lines at present if it had. Neither has it bribed any Herreshoff workman; yet it places the boat before its readers with an accuracy upon which they can surely depend.

The boat is being built in the cradle that was made for hauling out Defender, and will be launched in it on the newly constructed railway. No such sticking on the ways as marred Defender's launch need be feared, and the launch of the new boat should be an easy task. The keel rests level in the cradle with its bottom in the same line as it will later float. The boat will of course also be level,

and when lowered into the water will simply float from the cradle and be hauled clear of it.

Work on the boat is being rushed. The frames are being set up very rapidly and the plating is being sheared and bent to shape. The contract calls for her delivery June 1, and seems likely to be fulfilled.

No reason can now be given why Tobin bronze has been used instead of manganese bronze, as in Defender, but the bronze is undoubtedly Tobin, since it comes from the Ansonia Brass and Copper Co., the holders of patents on its production. The Pennsylvania Steel Co. is understood to have furnished all the nickel steel for the boat, but that in order to secure their prompt delivery the frames and plates have been rolled in several different mills.

The arrival of many more bulbed angles than were apparently needed for frames at the usual spacing of 20 in. led to the report that the frames were to be spaced closer together. It now appears that the bulbed angles are used in places where plain angles were used in Defender, a gain in strength.

The only reason ever given for the use of manganese bronze in 1895 was that the rolls in the mill producing it were newer and smoother than those of the Tobin bronze people. Perhaps a reversal of the situation is accountable for this year's change.

Summing up the boat, she is found to be lighter, stronger, more powerful and more easily driven than Defender. She will carry a larger sail plan than Defender and carry it well. She is an improvement in model as well as construction. In the hands of C. Oliver Iselin and with Charlie Barr for skipper, backed by such a Deer Isle crew as handled Defender so famously, she ought not only to beat the '95 champion with ease, but also to set Shamrock the hardest kind of a task next October.

So here is success to the boat and to every one directly interested in her. May she prove the winner that she promises.

According to the latest accounts from the other side the challenger, Shamrock, is well under way at the Thorneycroft yard. Her plating will be of manganese bronze.

Judge Dartnell.

THE older members of the A. C. A., those who were present at the Stony Lake and early Grindstone meets, will learn with regret of the death of Judge Dartnell, of Whitby, Canada, a member of the association since 1884. Genial, sociable and fond of camp life, he made many friends at the meets. The following particulars of his life are from the Whitby Chronicle:

Early Thursday morning, Feb. 2, His Honor, Judge Dartnell passed away at his residence in Whitby. For the last year and a half the Judge has been very feebly physically, as the result of a paralytic stroke, and his death, while not expected, was less of a shock to the community than if he had been in robust health.

George Henry Frewen Dartnell, Senior Judge of the county of Ontario, was born in the city of Limerick, Ireland, Feb. 13, 1834, the son of Edward Taylor Dartnell, formerly a leading solicitor of that city, and more recently County Crown Attorney and Clerk of the Peace for Prescott and Russell. The latter came to Toronto, where he settled, while the Judge was still a boy. Judge Dartnell studied law with Chief Justice Hagerty and his partner, the late Lieutenant-Governor Crawford, and also with the late Hon. John Hillyard Cameron, the late Lieutenant-Governor, Hon. J. B. Robinson, and the latter's brother, Christopher Robinson, Q. C. He was called to the bar in 1858, and commenced practice in the year, opening an office in Whitby. For a time he was a partner of Hector Cameron, Q. C., and also of H. J. Macdonell, late Clerk of the Peace for the County of Ontario. In 1859 he was appointed Master in Chancery. His appointment as junior judge took place in 1873; he acted as judge of the county of York for nearly a year, during the illness of the late Judge Duggan. In 1896, on the death of Judge Burnham, he became Senior Judge of the county. Judge Dartnell early took an interest in the volunteer force. He raised a company in Whitby in 1864, and was called out for active service during the Fenian raid. He retired with the rank of Major; but was subsequently gazetted as Lieutenant-Colonel (unattached), as a special case, being the only officer in the force enjoying such promotion. His services as Musketry Instructor at the camp, Niagara, met with most favorable recognition at headquarters. Judge Dartnell has always taken a very active interest in educational matters. For many years he occupied a seat at the School Board, and for nine years filled the office of chairman, and was the recipient of a handsome testimonial and address by the citizens in recognition of his services in the cause of education. The Judge has been president of the St. Patrick's Society, president of the Whitby Cricket Club, and vice-president of the Ontario Cricket Association. Although a judge,

"A scholar, and a ripe, good one;
Exceeding wise, fair spoken and persuading,"

Judge Dartnell was not above giving his countenance and encouragement to many sports. The family is of Huguenot French origin, his ancestors having settled in Ireland more than 200 years ago, and, like the Anglo-Normans, became "more Irish than the Irish themselves." Judge Dartnell married, first, Louisa, daughter of Anthony B. Hawke, for many years Chief Emigrant Agent for Canada; second, in 1873, Caroline, daughter of the late G. C. Gross, Esq., Whitby. In politics the Judge was Conservative, and in religion a member of the Church of England.

As a judge he was held in high esteem. Not long since a Toronto gentleman, who has had considerable experience with the law, was heard to say that he considered Judge Dartnell one of the ablest, fairest and most judicious judges in Ontario.

He leaves a widow and four children, two sons and two daughters.

YACHTING NEWS NOTES.

The Brooklyn Y. C. held its annual meeting on Feb. 20, the following officers being elected: Com., C. H. Humphreys; Vice-Com., H. W. Kilbourne; Rear-Com., C. H. Oliver; Meas., R. C. Hopkins; Sec'y, William Cagger; Treas., Willard Graham; Trustees, to serve three years, P. H. Jeannot, Edward Salt; Race Committee, P. H. Jeannot, H. H. Stanwood, Charles Van Riper; Membership Committee, A. S. Richoffer, C. H. Frost, Joseph N. Gans; Nominating Committee for 1900, S. S. Golding, John Healy, William Cagger, G. C. Shaffer, James Riley, G. A. Domminy.

The annual meeting of the Eastern Y. C. was held on Feb. 14, the following officers being elected: Com., Henry W. Lamb; Vice-Com., Ralph E. Forbes; Rear-Com., Laurence Minot; Sec'y, William S. Eaton, Jr.; Treas., Patrick T. Jackson; Meas., Henry Taggard; Members of Council at Large, William C. Loring, George A. Goddard; Regatta Committee, Henry H. Buck, Henry Howard, Francis A. Seamans, Eben B. Clarke, Odin B. Roberts; Committee on Admission, Charles F. Adams 2d, Gordon Dexter, Theophilus Parsons, William C. Loring, the Secretary (ex-officio); House Committee, Frank Brewster, J. Prince Loud, Harry K. White, George Atkinson, Jr., the Secretary (ex-officio).

The Jeffries Y. C., of East Boston, held its annual meeting on Feb. 20, the following officers being elected: Com., Frank H. Tilton; Vice-Com., Walter S. McLaughlin; Fleet Capt., Herbert F. Vaughn; Meas., Ambrose A. Martin; Sec'y, Alfred E. Wellington; Treas., Walter S. McLaughlin; Regatta Committee, A. A. Martin, Jacob Rood, Charles L. Joy; Directors, Elmer E. Grey, William B. Pigeon, Charles L. Joy, W. B. Starkweather, A. A. Martin, Jacob Rood, A. E. Wellington, George A. Anderson, W. S. McLaughlin, Herbert F. Vaughn, John Marno, Frank H. Tilton, H. H. Smith, E. A. Skinner; Representative to Massachusetts Y. R. A., Charles L. Joy.

The schooner yacht Wingit, a small auxiliary, sailed some time since from New York for Florida, with Capt. Max O. Newman in charge, assisted by his son, William Newman, as mate. On Feb. 10 she sailed from Wilmington, N. C., for St. Augustine, and on Feb. 13 Capt. Newman was washed overboard. The yacht's yawl boat went overboard at the same time, and Capt. Newman managed to catch hold of her, but those on the yacht were unable to pick them up. The yacht arrived at Fernandina on Feb. 20.

Lasca, schooner, Jas. S. Watson, sailed from New York on Feb. 19 for Nassau, N. P., where Mr. Watson and his family will join her for a cruise in the West Indies.

On Feb. 21 a bill was passed in the Assembly permitting the New York Y. C. to own property to the value of \$500,000, instead of \$100,000, as heretofore.

During the late cold weather the buckeye Dixie, owned by the Rev. Thomas Dixon, Jr., was caught in Chesapeake Bay, Mrs. Dixon being on board with her young son and Mr. and Mrs. J. H. Ellsworth, of Staten Island. The yacht ran out of food and fuel, and those on board only kept warm by burning the yawl boat and other woodwork, while they were able to enjoy but one meal per day for several days. They were finally taken from the yacht by the life saving crew of Cobb's Island Station.

The new steam yacht American, Am. Y. C., Archibald Watt, has been officially measured, and found to be of 851 tons gross and 578 tons net. Her official number is 107,433 and her signal letters are KNVJ.

Messrs. Tams & Lemoine have placed a contract with the Lawley Corporation for a centerboard schooner of composite build, of 70 ft. lw. and 93 ft. over all, 20 ft. beam and 8 ft. 6 in. draft, designed by them. The owner of the yacht is reported to be H. L. Eno, of Saugatuck, Conn.

The Spalding St. Lawrence Boat Co., of Ogdensburg, has just issued a new catalogue of small power yachts, including yacht tenders, hunting launches, high speed open launches, cabin launches, etc. The company is using for motive power the Alco-Vapor Motor. Numerous sizes and designs, for all classes of work, are listed and illustrated.

The American Boat Works, Fred Siebert, manager, of St. Louis, Mo., is making a specialty of a small sailing yacht, built on the knock-down plan, all parts being got out, fitted and then shipped in a crate, ready to be put together by any builder. The boat is 20 ft. over all, 5 ft. beam and about 8 in. draft without board, with good overhangs at each end. Everything excepting sails and rigging is furnished for a very low price, the frame, planking, nails, etc., and the young amateur will find this an easy introduction to practical building.

Canoeing.

CANOEING NEWS NOTES.

The 1899 catalogue of J. H. Rushton, Canton, N. Y., is devoted exclusively to canoes and rowboats, Mr. Rushton, after a good deal of experimenting with small power boats, having decided to discontinue them and devote himself exclusively to those craft which have made his name known everywhere. The list of models, both of canoes and boats, has been extended and now includes a very large variety of pleasure craft. The quality of the Rushton work is too well known to need any special mention. The catalogue, which is a very large one, lists everything in the way of sails, spars, fittings, paddles, oars, etc. The various models and rigs are so fully described in detail that the purchaser need have no difficulty in selecting exactly what he may desire for any special purpose.

Rifle Range and Gallery.

Conlin's Tournament.

THE programme of Conlin's Jubilee and Sportsmen's tournament, to be held at Conlin's gallery, N. W. corner of Thirty-first street and Broadway, New York, can be obtained by addressing Mr. James S. Conlin as above. The tournament opened on Feb. 25 and will continue day and night until March 18. The event prizes and rules of the tournament are as follows:

Rifle Matches.

One hundred shots match, only one entry allowed, .22 cal. rifles only used, and furnished by the gallery; 10 targets for each man, and 10 shots on each target; distance 25 yds., off-hand; standard American target to be used; entrance fee, \$5; 50 cents of the entrance money to be divided into prizes of 20, 15, 10 and 5 per cent.; for the best 5 targets of any one contestant in this match, the prize will be the magnificent engraving of "The English Rifleman at Wimbledon," presented by John Rigby, Esq., captain of the Irish Rifleman.

Rest rifle match, or "go as you please": To be shot on the seven-bullseye target; re-entries; gold medals for first and second prizes; entries 25 cents each; distance 20 yds. Presented by Winchester Arms Co.

Rapidity and accuracy match: Re-entries allowed; entry fees 25 cents each; time for 15 shots, 15 seconds; for every second gained under the limit, two points to be added to the score; for every second over the limit, two points to be taken from the score; the best three targets to count; running deer target. Prizes for this match are: First, gold medal, presented by the Peters Cartridge Co. Second, an elegant rifle, presented by the Stevens Arms Co. Third, gold badge.

Pistol Matches.

Pistol match: Re-entries; entries 25 cents, 7 shots each;

standard American target; distance 12yds.; three best targets to count. Prizes: First, Stevens target pistol. Second, a pair of sporting pictures. Third, one sporting picture.

Revolvers match: Three elegant gold medals are the prizes in this match; re-entries; entries 50 cents; the two best targets, Gastine Reunette, French, at 12yds., and 17 meters to count. The well-known revolver rules to govern this match.

Colorado Springs Rifle Club.

COLORADO SPRINGS, Col., Feb. 19.—The following scores were fired on the above date at the range of the Colorado Springs Rifle Club, in competition for the Stevens rifle, which was donated to the club by the J. Stevens Arms Company:

Cincinnati Rifle Association.

THE following scores were made by members of the Cincinnati Rifle Association, in regular competition at Four-Mile House, Reading Road, Feb. 19. Conditions, 200yds., off-hand, at the German ring target. Hasenzahl was declared champion with a score of 224. He also wins the honor medal for February with a score of 71 on the honor target. Weather conditions were not as favorable as could be desired on account of a strong, erratic wind blowing across the range from 3 to 5 o'clock:

Champion score:										
Hasenzahl.....	18	22	17	21	25	23	23	24	22	218

Trap-Shooting.

If you want your shoot to be announced here send in notice like the following:

Fixtures.

March 1.—White Plains, N. Y.—Fifteen live-bird handicap, \$10 entrance, birds included. E. G. Horton, Manager, White Plains.

March 2.—West Chester, Pa.—West Chester Gun Club's annual shoot for a Remington hammerless. F. H. Eachers, Sec'y.

March 2-11.—Madison Square Garden.—Tournament in connection with Sportsmen's Exposition. Address, Sportsmen's Exposition, 280 Broadway, New York.

March 25.—Pawling, N. Y.—Postponed shoot of the Pawling Rod and Gun Club. Geo. S. Williams, Sec'y.

March —.—Brooklyn, L. I.—Monthly shoot of the Brooklyn Gun Club. John Wright, Manager.

April 4-5.—Chambersburg, Pa.—Chambersburg Gun Club's spring live-bird and target tournament; open to all. J. M. Runk, Captain.

April 11-13.—Elkwood Park, Long Branch, N. J.—The Interstate Association's seventh annual Grand American Handicap tournament. Entries close April 4. Edward Banks, Sec'y, 318 Broadway.

April 18-20.—Lincoln, Neb.—The Lincoln Gun Club's second annual interstate tournament; targets and live birds; \$500 added. Geo. L. Carter, Sec'y.

April 18-21.—Baltimore, Md.—Prospect Park Shooting Association's tournament; \$500 added. Stanley Baker, Sec'y.

April 25-27.—Kansas City, Mo.—Ninth annual tournament of the Missouri State Amateur Shooting Association, under auspices of Washington Park Gun Club; \$400 added money; target and live birds. Walter F. Bruns, Sec'y.

April 28-29.—Baltimore, Md.—Tournament of Baltimore Shooting Association; targets and live birds; money added. Geo. L. Harrison, Sec'y.

May 2-5.—Lincoln, Neb.—Nebraska State Sportsmen's Association's twenty-third annual tournament, under the auspices of the Capital City Gun Club; six amateur and four open events each day; targets and live birds. R. M. Welch, Sec'y.

May 9-13.—Peoria, Ill.—Illinois State Sportsmen's Association's tournament. C. F. Simmons, Sec'y.

May 16-19.—Erie, Pa.—Ninth annual tournament of the Pennsylvania State Sportsmen's Association, under the auspices of the Reed Hurst Gun Club. F. W. Bacon, Sec'y.

May 16-20.—St. Louis, Mo.—Tournament of the Missouri State Fish and Game Protective Association. H. B. Collins, Sec'y.

May 17-18.—Oil City, Pa.—Tournament of Interstate Association, under the auspices of the Oil City Gun Club. F. S. Bates, Sec'y.

May 23-25.—Algona, Ia.—Tournament of the Iowa State Association for the Protection of Fish and Game. John G. Smith, Pres.

May 24-25.—Greenwood, S. C.—Annual live-bird tournament of the Greenwood Gun Club; 25-bird Southern Handicap. R. C. McCants, Sec'y.

May 30.—Canajoharie, N. Y.—All-day target shoot at Canajoharie, N. Y. Charles Weeks, Sec'y.

May 30-June 2.—Erie, Pa.—Ninth annual tournament of the Pennsylvania State Sportsmen's Association, under the auspices of the Reed Hurst Gun Club. Frank W. Bacon, Sec'y.

June 5-10.—Buffalo, N. Y.—New York State shoot, under the auspices of the Buffalo Audubon Gun Club; \$1,000 guaranteed; over \$2,000 in merchandise, and \$1,000 added money in open events. Chas. Bamberg, Sec'y, 51 Edna Place.

June 6-9.—Sioux City, Pa.—Fifth annual amateur tournament of the Soo Gun Club. E. R. Chapman, Sec'y.

June 7-9.—Columbus, O.—Tournament of the Ohio Trap-Shooters' League, under the auspices of the Sherman Rod and Gun Club. J. C. Porterfield, Sec'y, O. T. S. L.

June 14-15.—Bellows Falls, Vt.—Tournament of the Interstate Association, under the auspices of the Bellows Falls Gun Club. C. H. Gibson, Sec'y.

June 14-16.—Cleveland, O.—Cleveland Target Co.'s tournament.

June 20-22.—Wheeling, W. Va.—Third annual tournament of the West Virginia State Sportsmen's Association, under the auspices of the Wheeling Gun Club, Wheeling, W. Va. Ed O. Bower, Sec'y.

July 19-20.—Providence, R. I.—Tournament of the Interstate Association, under the auspices of the Providence Gun Club. R. C. Root, Sec'y.

Aug. 9-10.—Portland, Me.—Tournament of the Interstate Association, under the auspices of the Portland Gun Club. S. B. Adams, Sec'y.

DRIVERS AND TWISTERS.

On Saturday morning last Manager John S. Wright, of the Brooklyn, N. Y., Gun Club, handed the club's check for \$10 to the secretary-treasurer of the Interstate Association, the same being the forfeit money necessary to enter C. W. Billings, of Hoboken, N. J., as a contestant in the coming Grand American Handicap. Mr. Billings is a member of the Brooklyn Gun Club and won the free entrance to the Grand American Handicap offered by the club to the man making the highest aggregate in eight of the twelve monthly shoots of the club from March, 1898, to February, 1899, inclusive.

On March 17 and 18 the sixth annual 100-bird handicap of the Riverton Gun Club, Philadelphia, will be held. Handicaps will be from 25 to 30yds. The programme for the first day provides two events, one at 10 birds, \$10 entrance; moneys, 40, 25, 15 and 10 per cent. Second event, 30 birds, \$25 entrance, 30yds. rise; cup and 10 per cent. to first, 25 per cent. to second, 15 to third and 10 to fourth. The 100-bird handicap will take place Friday, March 18. The conditions are 100 birds, \$100 entrance.

Two of the contestants in the amateur championship, which was shot at the Carteret Club's traps, Garden City, L. I., N. Y., Feb. 21-22, have made European records as shooters that they may well be proud of. Mr. Oakleigh Thorne's mark at the traps of the Gun Club, of London, England, is 31yds.—a mark on which he has few companions. Mr. Foxhall Keene, as a member of the Cercle des Patineurs, of Paris, France, shot himself back to the 32½ yd. mark, and kept on winning, when he got back there.

Mr. Elmer E. Shaner, the accomplished manager of the Interstate Association, has been in New York some days, putting some finishing touches on Grand American Handicap matters and arranging for the tournament at the Sportsmen's Exposition, he having that part in charge. Those who wish to see clock-work precision in managing the details of a tournament will have that opportunity when they observe Mr. Shaner in charge.

In a brief note, to which the signature of the King Powder Co. and the Peters Cartridge Co. are attached, we learn that they will occupy space 75 (southeast side), at the Sportsmen's show; and they add: "It is not our intention to make an elaborate display of the goods we manufacture, but to provide suitable and comfortable headquarters for our friends and the trade generally." T. H. Keller, their able representative, will be in charge.

At Lyndhurst, N. J., on Feb. 25, Mr. Harold Money, son of the famous Capt. A. W. Money, defeated Mr. T. W. Morley for the E. C. cup, emblematic of the championship of New Jersey. The score was 42 to 36. While the score seems low, the conditions made good shooting difficult, the background being mixed trees, fences and buildings, and the targets were thrown very swiftly.

An electric motor will drive the magatrap which will be used to throw the targets of the Sportsmen's Exposition's tournament, to be held on the roof of Madison Square Garden, the programme of which was published in our columns last week. This will insure the most precise uniformity in the speed of the machine, and consequently the speed of the targets will be more uniform.

The letter of Mr. Edward Banks, in the matter of cocking hammer and hammerless guns in live-bird shooting, when a misfire occurs, will be read with interest and profit by all who participate in competition or who wish to keep posted in matters pertaining to trap-shooting. It will be found elsewhere in our trap columns.

No doubt the tournament of the Sportsmen's Exposition will develop some new wonders in the way of a continuous performance in breaking targets, as several seasoned gladiators will try their hand at it. Still, it is more than probable, that the tournament will be run long enough for all to miss at least one target.

The daily papers will persist in saying that any person winning the E. C. cup, which is emblematic of the inanimate target championship of New Jersey, three times in succession, will become the permanent owner of the trophy. Such is not the case, as the cup is a challenge trophy, and goes with the title of champion of New Jersey.

On Feb. 22, at Watson's, with snow falling and the wind blowing across the traps from right to left, Messrs. E. S. Rice, Knowles and Parker shot each at 25 birds, making respectively 21, 19 and 19. On Feb. 21, at the same place, 30 birds each, Dr. Kibbey killed 26, Mr. Rice 23.

In a two-men team race, shot on the Carteret Gun Club's grounds on Feb. 24, Messrs. G. F. Francis and J. A. Graves defeated Messrs. Foxhall Keene and D. J. Bradley, 25 birds per man, by a score of 74 to 72. All stood at 30yds. There was a good breeze blowing at the time.

Under date of Feb. 4, Mr. E. D. Fulford writes us, from Cincinnati, as follows: "Please mention that I abandon my shoot, as many of my Western friends who promised to come will go with Mr. Rice, on his special train, which leaves Chicago about April 8."

Mr. E. B. Coe, of Baltimore, Md., is at present making a stay in this city, and will take part in some of the club shoots around New York for the next few weeks. Mr. Coe shoots targets well, but his specialty is live birds, on which he shoots a hot gait.

In their match at 100 live birds, at Watson's Park, Chicago, last week, a straight 12 o'clock wind blowing at the time, Silas Palmer and O. von Lengerke tied on 93. Palmer killed his second 25 straight, and he made a run of 33 without a miss.

At Watson's Park, Feb. 20, the Fearless Gun Club and the Alpine Gun Club, in a four-men team race, 10 live birds per man, tied on 27 each. The tie was shot off at 5 live birds, the Fearless team winning the tie by a score of 12 to 7.

Wednesday of this week is fixed as the date for a match between Mr. A. Johnson, of Atlantic City, N. J., and Mr. R. A. Welch, of Philadelphia, 100 live birds each, at Charter Oak Park, Gloucester, for a large purse.

Mr. L. B. Fleming, at the shoot of the Greenfield Gun Club, Pittsburg, Feb. 15, made the extraordinary high score of 99 out of 100, missing his 54th target. This beats the club record of 97, previously held by Pills.

In the match between J. Rehrig, of Weisport, Pa., and W. Terry, at Yardville, N. J., on Feb. 24, Rehrig won easily, with a score of 45 out of the 50 live birds shot at. Terry withdrew at the 44th round with 29 kills.

Mr. E. S. Rice defeated Mr. T. P. Hicks on Feb. 24, at Watson's Park, Burnside Crossing, in a contest for the Chicago Challenge trophy, the former standing at 28yds., the latter at 30yds.

Saturday of this week is target day at the New Utrecht Gun Club's shoot at Woodlawn, L. I.

Palm Beach Gun Club.

PALM BEACH, Fla., Feb. 23.—The handicap shoot at 30 targets, known angles and traps, \$2 entrance, took place to-day.

In the shoot-off for first prize Parker broke 15, missed 0; Chapin broke 15, missed 3.

Second score: Parker broke 13, missed 2; Chapin broke 14, missed 4.

In the shoot-off for third prize Mallinckrodt broke 9, missed 2; Jones broke 12, missed 0; Shinmeyer broke 8, missed 2.

Chapin won first prize, a very handsome silver cup. Parker, second prize, a very handsome silver flask. Jones, third prize, a very handsome silver stein.

Referee, Mr. Williamson; scorer, Capt. Ernest Allen; puller and manager, Wm. Dietsch. Rapid-fire system, using five traps.

Warwick Gun Club.

WARWICK, N. Y., Feb. 23.—Herewith is a complete copy of the scores made at the shoot of the Warwick Gun Club, on Feb. 22. In the morning the glare from the snow was very trying, and the result is low scores. The president's cup is a challenge cup, and never becomes the property of any one. The E. cup has to be won four times from four different shooters before it becomes the property of any one. This is Edsall's first win. In the race between Servin and Welling it was a toss-up until the last bird:

President's cup:

Shoot-off for badge:
Capt. Baldwin 0110-2 H. Koch 0121-3

New Utrecht Gun Club.

Bay Ridge, L. I., Feb. 18.—The close match between the Crescent Athletic Club and the New Utrecht was a very interesting affair, and demonstrated that the Crescents are very much at home on their own grounds at known traps and angles. The scores put up by them for twelve men would be hard to beat by any club. The shooting of J. Lott, Hallock, Sykes, Stake and Hegeman was highly commendable. From a New Utrecht standpoint it was a disappointment, inasmuch as their best men were off, but with all that, shooting at known traps and angles is a system that they have long since given up. We trust that in the return match they are just as good at unknown traps and angles as at known traps and angles. The scores:

Crescent Athletic Club.	
J. Lott	11111111111111111111—25
J. H. Hallock	11111111111111111111—24

F. A. Thompson	10101111111111111111	18
C. C. Fleet	11001111111111111111	15-235

Feb. 11.—Club shoot:		
A A Hegeman, A, 23.....	1121111210	—9
M Otis, B, 28.....	02222002212	—8
S B Toplitz, B, 28.....	20222011110	—8
C Ferguson, A, 30.....	0022022222	—7
F A Thompson, A, 29.....	10002*2212	—6

500-shell shoot, 3 birds, then miss-and-out:
A. Hegeman, 30.....11212-5 F. A. Thompson, 30.....020 -1
S. B. Topfritz, 29.....12220-4 M. Otis, 28.....000 -0

New Utrecht handicap:
M. Otis, 25.....22221-5 F. A. Thompson, 28.....02022-3
S. B. Topfritz, 25.....12111-5

Quarterly shoot:
A. Hegeman, 28.....10111-4 F. A. Thompson, 28.....20202-3
S. B. Topfritz, 28.....02112-4 M. Otis, 28.....12002-3

Hegeman was very much "in it" to-day, winning the club shoot and scoring 4 points in the quarterly shoot. Topfritz and Otis won out in the New Utrecht handicap.

Woodlawn, L. I., Feb. 22.—The particular feature of the holiday live-bird shoot of the New Utrecht Gun Club was the race between Hegeman and Phister. It was good for sore eyes to see those members at the grounds who make a visit there once a year or less, and then shoot out those who are there all the time.

We would suggest to Mr. Van Allen to make his entry for the Grand American Handicap right away, for if his shooting of to-day is any criterion, he certainly will get a share of the purse. Not a miss the whole day, and on hard birds at that:

There will be four shoots on each club day, viz., the second and fourth Saturdays in each month. The shooting committee have endeavored to so arrange the handicaps as to give an equal chance to all members. These handicaps are subject to change at the monthly meetings of the shooting committee, and when changes are made they will be based upon recent scores.

Event No. 1 will be the regular club shoot, at 10 birds. The handicaps are arranged on the point system, the same as last year. It is desired that this shoot commence promptly at 2:30, and no entries will be received after the completion of the fifth round. There is no entrance fee in this event, but a sweep can be arranged at the pleasure of those participating.

Event No. 2.—An entrance fee of 25 cents will be charged in this event, the money going to the club. A sweep can be arranged at the pleasure of those participating. The shoot is at 5 birds, and the handicap is one of distance only. The member having the most wins at the end of the year is entitled to compete in the Grand American Handicap of 1900, the club paying his entrance fee therein, and also for his birds.

Event No. 3.—The handicap is arranged on the point system, every bird killed counting 1 point. Entrance fee 50 cents, the money going to the club. A sweep can be arranged at the pleasure of those participating. The shoot will be at 5 birds. A prize will be purchased by the club with the money received in entrance fees, and this prize will be presented each quarter to the member having the most points to his credit.

Event No. 4 will carry with it a merchandise prize, to be given every month to the member having the highest number of points to his credit. The shoot will be at 5 birds, a clean score counting 1 point, 4 birds killed 1/2 point, and 3 birds 1/4 point.

E. G. Frost, Sec'y.

Altoona Rod and Gun Club.

ALTOONA, Pa.—*Editor Forest and Stream:* One of the most successful one-day tournaments ever held in central Pennsylvania was that given by the Altoona Rod and Gun Club, Altoona, Pa., at their Llyswn grounds, near the city, on Feb. 22. In fact, it reminded one of the big tournaments this organization has held at their Wapsononock grounds, now locked up in the embrace of winter. The weather was all that could have been expected during mid-winter, and was not unpleasant, save a high wind that prevailed throughout the day, which made clean scores almost an impossibility.

The shooting throughout was quite spirited. There were thirty-six contestants. Among those from a distance were D. D. Stine and P. J. Trego, Tyrone, Pa.; J. A. Holderbaum, Warren Smith and John Acker, Osterberg, Pa.; Uncle John Gelm, Braddock, Pa.; W. J. Koplin, Emmet Rhoades, and J. A. Rhoades, Johnstown, Pa.; Justus Volk, South Fork, Pa.; R. B. Bennett and M. McDaniel, Pittsburg; J. B. Highberger, C. A. Conrad, S. B. Kellerman, A. E. Earhart, C. Wendroth and F. P. Abercrombie, Cersson, Pa.; T. H. Keller, New York, and W. G. Clark, Elwood City, Pa.

During the evening a sumptuous banquet was served in the club house dining room, in honor of the visiting shooters.

The club is in a most flourishing condition and is assuming its old-time place in the trap-shooting circuit. The scores:

No. 846 BROADWAY, NEW YORK.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iv.

THE EASTERN ELK.

It is more than fifty years since the wapiti was practically exterminated from the eastern United States and Canada, and one of the most eminent American authorities on mammals has stated that it is probable that the Eastern elk was a different animal from the Western form with which we are all so familiar. Only a single specimen of the old-time Eastern elk is known, so far as we remember, and characteristic remains of this species of any sort are almost entirely wanting. When, therefore, the report was received that in 1896 Count Henri de Puyjalon had found traces of elk in the western portion of the Province of Quebec, and when early last winter we received the report of the killing of an elk on a tributary of the Mata-pedia River in Bonaventure county, Quebec, it seemed highly desirable that an investigation of these reports should be made, and that positive information should be had as to whether elk are still found in either of these localities. If found in either, the chances were altogether in favor of their belonging to that form which once ranged in the northeastern United States, that is to say, in New York, parts of New England, and also in New Brunswick and Nova Scotia.

In view of all these facts, the FOREST AND STREAM set on foot an inquiry, the results of which are here given. We have consulted a number of men, all of whom are in the highest degree reliable, and the evidence is overwhelming that the elk still exists in the western portion of Quebec on the head waters of the Ottawa River. Thus, the report of the Count de Puyjalon is amply confirmed by positive testimony much more satisfactory than he was able to furnish. On the other hand, the story of the elk killed near the Metapedia is by the statement of Mr. Joncas disproved. This, however, is further complicated by a letter which we publish this week from Mr. Noah Palmer. The whole subject is one of such interest that any evidence bearing on it will be gladly received.

Mr. L. Z. Joncas, now in charge of the Quebec exhibit at the Madison Square Garden, states emphatically that the animal killed in the Metapedia in eastern New Brunswick and called an elk, is nothing more than an ordinary woodland caribou, with a somewhat unusual horn development. As the head is on exhibition in the Garden, the statement may easily be verified. In reply to inquiry as to elk in western Quebec, Mr. Joncas shows the heads of three wapiti killed on the headwaters of the Ottawa. The heads were procured by Indians near Grand Lake Victoria, and there is reason to believe that there exists in this neighborhood at the present time, a breeding stock of *Cervus canadensis*, sufficiently numerous to perpetuate the race. Mr. Joncas says that in this Pontiac country on the upper Ottawa, elk were found in large numbers thirty or forty years ago, and that they are apparently on the increase at the present time. The region lies between the 77th and 78th parallels of longitude, and the 47th and 48th of north latitude.

Further evidence on this point is given by Mr. N. E. Cormier, Superintendent of Fisheries and Game, Avinier, Quebec, and also by Mr. L. O. Armstrong, of the C. P. Ry. Both gentlemen state that they have personal knowledge of the existence of wapiti at the present time in the neighborhood mentioned. Mr. Cormier says that George C. Rainboth, Provincial Land Surveyor, saw elk near Grand Lake Victoria in the winter of 1896.

The elk seem to be confined closely to this particular locality. Men who are familiar with the country a few hundred miles away, say they have never seen nor heard of elk. Alfred Lanoie, who has made nearly a dozen trips to Hudson's Bay, and passed to east and west of the Pontiac country, says he knows nothing of elk. So does Beebe Tirette, of St. Raymond, and Mr. C. C. Farr, of Haileyburg, on Lake Temiscamingue. Willie Paulson, who hunts on the Montreal River and around Lake Temagong, furnishes a piece of information, however,

which seems to indicate that stray wapiti occasionally range several degrees to the west of the region which seems to be occupied by the main herd. He states that the wife of Malcolm McLain, a former Hudson Bay Company factor, saw an elk on Lake Animapissing recently. Mrs. McLain has seen caribou and moose and deer all her life, but she had never before seen an elk. She described the animal as being large as a moose, and of a yellowish patchy color. It was a bull, and had horns similar to a deer's, except that they were much larger, and bent backward instead of forward. The animal was walking when seen.

Eight years ago Paulson himself killed an odd animal which would have furnished material for a pseudo elk story to a man inclined to prevaricate. He says, however, that it was nothing but a moose with an unusual horn development. Its color was black, and it had all the moose characteristics, except as regards its antlers. Paulson described the horns as branching like those of a caribou. There were six or seven prongs on each side, which were a foot or more in length, and no wider than the parts of a caribou's antlers. It was a very old animal, Paulson said, and was killed near where the Montreal River empties into Lake Temiscamingue. The horns were sold to the Hudson Bay Company.

The testimony which we have thus recorded, which appears to establish the existence of the wapiti or round horned elk far to the east of any region which it was thought now to occupy, is of very great interest, for it offers to big game hunters a new, and not very inaccessible, locality where elk may be killed. Yet the news is far more interesting to the naturalist than it is to the hunter; for in this herd of elk—which cannot be large—may be found the only survivors of a form which once roamed over the forests and valleys of the eastern States from Georgia on the south far into Canada on the north.

Whether this eastern elk was actually different from the Rocky Mountain form may well enough be doubted, and we can have no positive knowledge about this until specimens of the two are compared. Yet, as the elk in question are found about in the longitude of Buffalo, N. Y., or not more than two degrees west of Washington, it may be regarded as quite certain that they represent the eastern form, and are not more different from it, than are the Virginia deer which inhabit the same region different from those ranging in Maine or the Adirondacks.

It appears that, although no one else seems to have known of the existence of this eastern herd of elk, the Indians and the few Hudson's Bay men who occupy the limited area of its range, have always known that the elk were there, and a few hides have been exported by the Hudson's Bay Company each year. It may be imagined, however, that the number of the animals found here is not large, and now their existence has become generally known they will in all likelihood soon be exterminated unless active measures are taken for their protection against visiting sportsmen and Indians alike. It is earnestly to be desired, therefore, that the Quebec Provincial Government should absolutely prohibit for a considerable period the killing of any of this remnant of the eastern elk, and in this connection the recommendations made some years ago by Count Henri de Puyjalon deserve careful consideration.

To set aside as a great game reserve, where no hunting should be done, the whole territory between the Ottawa and Temiscamingue to the west, Lakes Quinze, White and Expanse to the north, the Ottawa River to the south and a line starting from the mouth of the Ouanaouais passing Lakes Antiquas, Grand Lake, and following the Du Moine River to the Ottawa to the east, would fairly place Quebec in the forefront of the Provinces so far as big game protection is concerned. A definite area, which is reserved can be effectively policed and protected. The overflow from the protected country would give wonderfully good hunting in the whole region adjacent to the reservation. In practice the restrictions on hunting would not be felt, while the advantages from having such a protected stock of game as would soon exist in the reserve would attract sportsmen from far and from near. Such action is perhaps too radical to be hoped for at present, but some such radical action must be taken before long.

The far-sighted policy of the Provincial Government of Ontario in setting aside as a game and fish reservation and a public pleasure resort for its people the noble Algonquin

Park south of the Ottawa River, might wisely be imitated by the Province of Quebec in establishing for its people within the boundaries suggested, and so adjacent to the Algonquin Park, a pleasure resort not less beautiful, more extensive and more valuable.

THE NEWFOUNDLAND CARIBOU.

THE people of Newfoundland appear to be pursuing a line of conduct with respect to their supply of big game precisely like that followed by residents of the United States, and destined, if uninterrupted, to result in a like ruin of native resources. The stories of vast slaughter of caribou, such as is given in our columns to-day, show that in Newfoundland a present plenty is blindly accepted as a permanent abundance; and while restrictions are placed upon visiting sportsmen, the native market-hunter is given full license to slaughter by the ton. There is no perceptible diminution of the supply, we are told. That is the old, old story. There is always a period, as there was in the United States, when unrestrained killing of game caused no visible difference in the supply. But the disastrous rule in nine cases out of ten is that when the evil results of unbridled pursuit begin to make themselves manifest, it is then too late to stay the game decrease.

The local game protective association has undertaken to provide, by legislative intervention, for restricting the killing of caribou. This is a public concern of importance in which they should have the hearty support of their fellow citizens. Properly cared for, the Newfoundland caribou may be preserved as a permanent resource of the island, and a way should be found to do this without interfering in any respect with the real interests of any one concerned.

The improved means of communication between Newfoundland and the United States, the better provision likely to be made for the entertainment of visitors to the island, the narrowing of other available game fields, and the growing fame of the big heads to be won on the deer barrens—all these influences are tending to promote the coming of sportsmen-tourists in increasing hosts. The license fee imposed is so large that the revenue to the public treasury, already worthy of consideration, will in the future mean much more. But American sportsmen will resort to Newfoundland for caribou only so long as there shall be caribou there to reward them for the money and time expended. The authorities of the colony may not expect to derive a revenue from this source after once the report goes out that their hunting resources have been depreciated. Action looking toward better protection of the game should be taken at once.

SNAP SHOTS.

The spirit of organization among hunting guides is spreading. We report to-day a new association just formed by the guides of the Jackson Hole district in the Rocky Mountains. An organization of this character is capable of accomplishing a vast deal both for the guides and their employers, if it shall be conducted simply and honestly with a purpose to promote fair dealing between the two classes. Big game hunters will heartily wish the new movement a full measure of success.

In the rush of the closing days of the fifty-fifth Congress, the Lacey-Hoar bird bill failed of enactment, which means that it is dead altogether, and if the matter is ever taken up at Washington again it must be from the beginning. As both Senator Hoar, of Massachusetts, and Representative Lacey, of Iowa, will be in the next Congress, we may reasonably anticipate that they will renew their activity in this direction.

Further distressing reports of the effects of the great storm upon the game come to us from the South. In some sections the supply is apparently wiped out so completely that years will be required to restore it. One condition which added to the destructiveness of the storm was that it advanced from the south to the north, and thus there was for the birds no retreat before it.

The Maryland Game Protective Association, which is among the most businesslike and efficient of the protective organizations of the day, has been forehanded and energetic in providing food for the quail in the several counties of the State. Grain has been supplied, and in some instances where conditions favored such enterprise, shelters have been established.

The Sportsman Tourist.

Gens des Bois.—II.

Guy Ferguson.

THOUGH of Scotch ancestry, Guy Ferguson has few of the traits that characterize the old Covenant stock. He works when he has to, and has no more love for wrestling with knotty problems than with knotty logs. Such jobs he leaves for others, provided he cannot, by the exercise of his ingenuity, devise some easy way for circumventing the difficulty. His fertility of resource at such times stamps him more certainly, perhaps, than anything else as a true Yankee. In physique Guy is of the greyhound type.

He is a wiry man, above the average height, with sandy mustache and hair, thin features, quizzical eyes that are equally good at pointing a joke or sighting a rifle, and a face that as a whole has a singularly expressive power for understanding other men. Some men accumulate flesh by eating; but with Guy every pound of food taken into his system and every plug of tobacco consumed goes to make nerve and sinew.

In off-hand shooting, Guy's hand trembles noticeably, but the organizer of a chicken shoot who knows him derives little comfort from the fact, for he is well aware that it is only a question of how many chickens he can afford to sacrifice to that unerring aim before he may with decency bar the unprofitable contestant.

Guy is a quick, shifty farm laborer, but he is chiefly known for his ability as a coon hunter, "ginshang" rustler, fisherman and locator of wild honey. In these respects he has few equals and no superiors, and taken all in all he is the representative woodsman of the hilly Lake Champlain country bordering on the Boquet Valley.

Bee Hunting.

"I was up on Split Rock Mountain last Sunday, and I got a line on some bees; but I didn't quite locate the honey," said Guy one day in September, while he was working for me at the Heathcote farm. It was just after dinner, and as Guy was fully aware, there happened to be no specially pressing work to be done that afternoon. He was also aware that on a farm no great waste of brain tissue is required to find an odd job to fill in the time; so he advanced an additional proposition.

"It's right up at the head of that clearing back of Baldwin's, and when I was up there Sunday I saw a big flock of partridge in the young hardwoods; must have been ten or a dozen."

Guy knew his ground. The mention of bees had only recalled to my mind the fact that the strawberry bed needed hoeing; but when he spoke of partridge—

"Guy," I said, "this is no afternoon for work; we will go up there and be back in time for the chores."

The season had only been open a few days, and as I was likely to get sitting shots at the partridge, I took along a .22cal. Marlin. Just before we reached Albert Baldwin's a gray squirrel dropped out of a little butter-nut tree by the roadside and ran along the stone wall toward a larger tree near by. I raised the rifle, but at Guy's suggestion lowered it again.

Guy's Soft Streak.

"I wouldn't shoot," he said, "that's one of Baldwin's pets. The old man feeds 'em corn in winter and likes to see them 'round."

"There's a soft streak in you, Guy," I remarked. "I don't believe you like to see other people kill game."

"Perhaps so," was the reply.

"You need to be excited even to like it yourself," I continued. "If a coon gets clawing your old dog or a partridge fools you half a dozen times, then you get worked up to enjoy hunting. By the way, Guy, what ever became of Topaz?"

"Oh, I didn't want to kill the old cat. He just disappeared."

"Yes, and he's come to life again, after six months, to steal more chickens. Perhaps you don't know it, but last night he was up at the cow barn waiting for his drink of milk, as usual."

Guy looked over toward the mountain and made no answer.

"Confound you! Guy!" said I; "when you're told to kill a cat why don't you kill it? You don't know what a shock it gave me to see that beast come walking into the barn. I naturally thought it was the ghost of its twin brother, Garnet, that I shot the other day with a chicken in its mouth."

Guy grinned. "I just naturally liked Topaz," he said. "He was one of the best barn cats I ever saw before he took to reaching through the wires of the brooder and hooking out chickens on his claws. Ever see him kill a rat? 'Tain't safe to hold them first time they're caught, you know. Old Topaz'd give 'em a fling in the air, and when Mister Rat come down he nailed him like a flash, and you'd lose no more grain through that leak in the box."

The Old Clearing.

Crossing a meadow that became poorer and almost gave out before reaching the line of forest trees, we climbed a fence, and passing through a sugar maple bush, came to a decaying orchard. The trees were sprawling and rotten-hearted, and the apples pithy and about as satisfying to chew upon as imitation griddle cakes made of colored flannel. At the further end of the orchard were the ruins of a house, contained within the cellar walls, and near by Guy picked up the sole of a baby's shoe.

"There was a woman here once, and a baby," he remarked. "They liked it better than the county-house, though in winter time they saw no more people than a bear sees in his den. Might just about as well have been dead, it seems to me."

A tiny brook came down back of the house, and following this, we made our way up the narrow clearing through scattered hickory trees, or walnuts, as they are called locally, and eventually reached its limit nearly at the summit of the mountain.

Setting Up for Bees.

Guy put his hand under a clump of junipers and brought out two smoky brown honeycombs, which he set up on broken mullen stalks on a little knoll. Bees were flitting hither and thither, and soon several had settled on the combs. From another clump of junipers Guy produced his box, and slipping it up beside the feeding bees, snapped the lid down and had one a prisoner. The box was divided into two compartments, connected by a sliding door. Light was admitted to the rear one of these through a glass window, and when Guy had seen the bee enter it he pulled the door shut and had him where he could again use the first compartment to trap other bees.

When he had caught four or five for use further along the line, we crouched close to the ground to watch the flight of the bees on leaving the honey. Guy was not quite sure of the direction in which they flew, and he wanted to be positive before setting up again.

A bee rose lazily from the comb and hung an instant above it, as if suspended by an invisible thread. The next it had vanished as lightning vanishes from the sky, leaving an impression of form on the retina, but to the uninitiated eye no clue as to its course.

"See that big maple over there?" said Guy; "didn't the bee go just a shade to the left of it?"

"It would be too great a tax upon the imagination to give an opinion just now," I replied. "I feel as if I had just waked up, and my eyes aren't sufficiently wide open yet."

After watching several bees pitch off into vacancy, I rather imagined Guy was right. If they did not go to the left of the big maple, I certainly did not see them go elsewhere. We moved ahead into the woods fifty rods or so, and then I helped Guy break down some young pines, so that he could see over the tops, and watched him release single bees, permitting them first to fill up on honey before taking flight, so that they would go straight to their storehouse to unload. A few trials sufficed to show that we were on the right line, and Guy decided that the bee tree was within a very short distance of us down a ravine sloping toward Lake Champlain.

A Brace of Grouse.

I left Guy walking slowly along, peering into the tops of the trees to find the particular hollow trunk in which the bees had their honey, and after a little search succeeded in locating the partridges in a tangle of brush and blackberry bushes. Some one had apparently been after them, for they flushed wild and made long flights before alighting. Presently, however, I saw one walking on the ground at a distance, and followed it along a hollow, where the rich black muck gave nourishment to thick-leaved, moisture-loving plants. The partridge voiced its nervousness from time to time by its whistling twitter, as it walked along in its jerky, hesitating way, something after the manner of an old muscle-bound rooster. It seemed at any moment to be on the point of taking flight, but it couldn't quite make up its mind to the necessity for such vigorous action. When the opportunity offered, I aimed at the neck next the body, and the bird was mine.

Walking back toward the hardwoods, I surprised a pair on the ground, and by an easy shot bagged a second grouse.

The mate of this bird flew into a thick, bushy tree at the sound of the shot, and I waited fully ten minutes without showing myself, thinking it would come into view. At the end of that time I heard Guy whistle, and advancing to pick up the dead bird flushed the one in the tree.

Treeing a Coon on a Man's Head.

Guy had succeeded in locating the bee tree, but it was then too late in the day to think of cutting it down. I suggested returning after dark, but Guy said it was safer to cut a tree in daylight. "You can see what you are doing then," he said. "It's easy enough to stop up the hole and smoke out the bees, but at night, if the bees once settle on you they'll crawl down your neck and up your pants on the inside, and you're much more likely to be stung. I'd rather cut half a dozen trees in daylight than one after dark."

"Speaking about the dark," continued Guy, "makes me think of coons. Parker Torrence wanted to come out with me one night to see what coon hunting was like. We knocked a coon out of a tree, and the first thing he knew the coon was running 'round between his legs, dodging the dog. Parker naturally yelled and kicked, for he was between two fires, as you might say, with his legs as the battleground, and the coon and dog were both a-working their jaws like steel traps, and like as not the coon would mistake some of his tender parts for the dog, or the dog would take a-hold, thinking he had coon; and I don't blame Parker for being a little excited—think I should have been so myself."

"I got a club as soon as I could, and went for the coon, and between me and the dog it got a little more'n it bargained for, and the first thing we knew it run right up Parker Torrence's back and set there on his head grinning like one of these here tooth powder advertisements."

"Parker was afraid to grab the coon, for fear he'd get his hands bit, and he was afraid to fall over, for fear the dog and coon would have it out on his face; and he couldn't think much anyhow, for the way the old dog was a-climbing over him, trying to reach the coon. After a while I got in a whack and did the William Tell act, but Parker he said he'd had enough of coon hunting."

"He said it was worse than joining a lodge, and if any one had to get clawed up next time it wouldn't be him. He guessed his curiosity was satisfied, and he'd know enough to stay home evenings with the old woman."

Seven Coons in One Tree.

"How many coons did you ever get at one time, Guy?" I asked.

"Seven," said Guy. "And got 'em all in one tree. Me and Ernie Mather were out back of young Charlie Stafford's over by South Mountain"—he indicated by a twist of his head in its general direction the mountain which gets its name "because it's south of North Mountain."

"Hunter, my old dog, struck the trail where the coons had clim up on a fence and by the way he told about it I knew there was more 'n one. Pretty soon we come to a big basswood tree that must 'a' been all of 3 ft. through. I says to Ernie, 'Bet you that's the tree,' but I knew well enough I didn't want it to be. Hunter circled round two or three times, and each time he came right back to the tree and stood up on his hind legs and smelt it. He made up his mind the coons was there all right, and there he hollered bloody murder."

"It was a terrible big tree. Well, I tell you, it was the biggest basswood in all them woods. Ernie says, 'How in thunderation are we ever going to get up there?' There wasn't a limb for 40 ft., and it did look to be a pretty tough proposition."

"I remembered that Charlie Stafford had an awful long ladder down at his house, and so me and Ernie went down there, and we couldn't wake Charlie up or any of the folks, but we happened to stumble on the ladder 'long-side the woodshed, and carried it back with us."

"Ernie he went up the ladder, and when he came to the top, he says, 'Golly, Guy,' he says, 'it's roft. from here to the first limb if it's an inch. Is there any soft place down there to fall on if I miss connections?'"

"No," says I, 'nawthin' but rocks. You've got to make that limb, my boy."

"So Ernie clim the tree, and presently he called down, 'I see somethin' looks like an old nest,' and then, 'No, 'tisn't, it's a coon. Gosh, there's two of them.' Then he clim up a little further and he says, 'Golly, Guy, I see another. Guy,' says he, 'the tree's full of coons.'"

"All right," says I, 'send us down one for a sample.'

Sample Coons.

"So Ernie he shot a coon with his twenty-two pistol, and the next one was so close he was touched some way and knocked off, and the two came down together. Hunter he went off for the nearest, which happened to be the wounded one, and the other started around the basswood."

"Thinks I, mister, you got to do something quick, or that sample coon 'll be a sample for somebody else, so I grabbed the one Hunter had by the tail and give it a sling up against the tree that settled it, and sent the dog for the other."

"The coon lit out across a medder, and Hunter wa'n't mor'n a foot and a half from her hind parts, but seemed as if he couldn't make it an inch less. They went across the medder straight as a rocket, and into a piece of woods beyond, and Hunter still a foot and a half from her tail."

"The coon went up a little pine tree, and Ernie he yelled to ask if I wanted him. I said I didn't suppose he could get down out of his basswood, and he didn't say nawthin' for some time. By 'n' by I yelled to ask if he was coming, and he didn't answer. I was scairt, I can tell you, for I didn't know but what he might 'a' fallen out that cussed tree. So I took a piece of rope and tied Hunter to the pine so 's to watch the coon, and I started back to see what had happened to Ernie. He'd been down in the thick woods and hadn't heard me call, and about half-way back I met him."

"Where you goin', he says, and I says, 'You're trying to play smart, young feller, making me think you fell out of that tree.' He said he hadn't heard me call, and we went back to the pine."

Hunter Gets Revenge.

"Ernie he clim the tree, and the first thing I knew he yelled:

"Look out; the coon's jumped.' Never knew 'em to jump 'thout they was knocked out before, but that coon done it sure enough, and down she came and started back for the basswood."

"Hunter he put for her and she didn't go a great ways before he caught her, or else she ketched him, one or the other. At any rate, when I got there she was a-sittin' astride Hunter's neck claspin' him with her fore paws and chewin' the top of his head zif it had been an ear of green corn. Well, sir, I kicked that coon off in short order, and Hunter he set to and finished her savage—had his mad up, and I don't blame him either."

More Coons.

"Ernie come down, and we went back to the basswood, and to show you how big it was, he'd taken off his coat and wrapped it round the tree to keep the coons up, and the two arms just touched the two sides of that ladder."

"Well, Ernie clim the tree and shot a young one, and it squealed some when Hunter took a-hold. Ernie says, 'Hurry up, Guy,' says he, 'let me send down another. The old one 's clim down, an' 's got her front feet on my arm, and she's a-pokin' her dirty old face into mine and snarlin' and snappin' so 's I don't like her actions!' Guess he was thinking of the one that had Hunter by the head."

"I grabbed the young one and slung it up against the tree. 'Now,' says I, 'let her come.' So Ernie shot that one. Let's see, that's four, ain't it? Yes, four. We got three more out'n that tree, that's seven. I never had more fun in all my life."

"There was two old shes, an old he, and four young ones. We skinned five of them in the woods and carried the other two home to eat."

"Talk about your dainty dishes! Ain't in it with a nice fat young coon, parboiled and baked. Me and Ernie, we had-ourn, and I want nawthing better, lemme tell you. No, sir; a nice young coon with all the fat cut off so 's to take out the coon taste 's a dish for a king, that's what I call it."

Sense of Direction and Speed.

Guy was striding along at a great rate, and his stories had whiled away the time and we had almost reached the house.

"Were you ever lost in the woods?" I asked.

"Once in a while on a dark night I've been puzzled a little getting my bearings," he replied. "Most generally I have an idea though which is the shortest way out." I recalled the stories I had heard of Guy's marvelous power of finding his way at night over the neighboring mountains, and remarked:

"I don't wonder you like bee hunting, Guy. You are something of a bee yourself in your sense of direction. I believe they could put you in a tight box and turn it round and round the way Darwin did with the bees he

was experimenting with, and carry you off into some wilderness fifty miles away, and the minute you were let out you'd hitch up your pants and start for home."

Guy grinned and said, "Oh, I guess if anybody wanted to lose me that bad they wouldn't have much trouble."

"In another respect," I added, "you are like a camel. Substitute a chew of tobacco for water and you'd make that fifty miles home without refreshment as easily as the ship of the desert crosses Sahara's sands. No camel could keep up with you though." I had reached the house, and hot and panting, sank to a seat on the porch. "Some swifter animal, the race horse, the—" But I swallowed the rest of my sentence, for Guy had disappeared around the corner of the house on his way to the barn.

The Passing of the Seasons.

Guy gets a great amount of enjoyment from such little woods trips when work is slack. There is something worth going after the year round. In winter there is ice fishing on the river and lake, fox hunting on the mountain, and rabbit shooting in the swamps ahead of Larry. In summer there is the annual blueberrying trip to Poke-o'-Moonshine Mountain, with the incidental fishing in Trout Pond and nearer home, Sunday afternoon excursions for blackberries and raspberries.

In far-off China the slant-eyed celestial is waiting with hard-earned cash to pay for the ginseng which Guy gathers in shady nooks on the northern hillsides, and friends at home petition him for bits of the root to carry in their pockets and nibble on as a cure for heartburn.

There are black bass to be yanked with the long cane pole from the crystal waters of the Boquet from Little Falls above to the dam below, and perch and pickerel and wall-eyed pike in Lake Champlain.

Then, as the season advances, Guy watches with a proprietary interest the wild bees gathering honey, which he confidently counts on for his own when the store has reached goodly proportions, and he travels cross lots to isolated cornfields to note the chankings from green ears which distinguish coon's work from the crow's. He notes where the gray squirrels have been chipping, and investigates again the various swales which in raspberrying time he learned were inhabited by partridge families, to see how the young birds have come on. The first crisp winds of autumn are the signal for gathering in the harvest—coons and honey and wild game. Perhaps when snow flies Guy takes a trip after deer and collects from the bog at the head of some forgotten little pond half a bushel of cranberries for Christmas in a birch bark basket made on the spur of the moment; or perhaps he varies his nightly coon hunts with a little trapping for mink and muskrat.

Time never hangs heavy on this woods lover, and his pleasures are of a kind that do not bring regret. Guy has not succeeded in accumulating much of this world's goods, but he has a capital of pleasant memories to draw upon that few men can equal. His father lived to a ripe old age and hunted bees up to the year of his death, and Guy no doubt will do the same. J. B. BURNHAM.

Uncle Oliver and the Moose.

An Adirondack Story.

THE huge antlers of a moose hanging over the entrance to the State Museum of Natural History at Albany have attracted the attention of visitors for many years, and sportsmen have often expressed a desire to know the story of the hunt that resulted in this splendid trophy. The actors in this terrible struggle through the deep snows of the North Woods in the early '40s have all disappeared, but during my boyhood at the old Vineyard Farm, in Ticonderoga, we children used to gather about our father in front of the blazing logs and tease him to relate for the hundredth time the story of Uncle Oliver and the moose.

"Your uncle, Oliver Judd," he would say, "was one of the most clever men I ever knew. He was the inventor of various useful agricultural implements, the proprietor of a small store at Little Falls, New York, where he used to petifog some in the justice's court, and was always in demand by the Whigs as a public speaker during political campaigns. Although he had never received a regular legal training, the cross-examinations were a terror to uncertain witnesses, and I recall how he once broke up a farmer in a little chain-stealing case that I had up in Crown Point along in 1854. I was practicing law in Ticonderoga then, and as Judd was visiting me at the time, I took him along just for the fun of the thing.

"The winter of 1845 was a cold one, and the light snow lay 4 ft. deep in the woods out in Herkimer county. The roads were drifted full, and it took the united efforts of the neighbors with plows and shovels to keep them even in a passable condition. Uncle Oliver had a large family of boys and girls, and as the village school-maker, I boarded with my sister Hannah, his wife. One morning Aunt Hannah said: 'Oliver, there isn't a bit of fresh meat or chicken to be had in the village for love or money. Don't you suppose you could kill a deer or something to-day?' I could see from the twinkle in your uncle's eye that he was more than pleased to get an excuse for a hunting trip, and in a short time his team was hitched up and a couple of trusted companions carrying long muzzle-loading rifles appeared on the scene to join him. I handed Oliver his famous old deer gun, lifted in the little spotted hound, Music, and the trio were off in a jiffy, amid the jingling of sleigh bells and the farewells of the family and the hunters' many friends.

"I wish I could tell the story as your uncle related it upon his return a week later with a big sleigh box full of fine moose meat and those lordly antlers hanging over the tailboard. Well, they drove all day up toward the hunting grounds near the headwaters of the Sacandagua River. The country was wild and uncultivated at that early day, and their progress through the rude unbroken lumber paths was quite slow and tiresome. At night they slept in a deserted log cabin and stabled the horses in an old shed. Early the next morning, after a snack to eat," to use Uncle Oliver's own words, "we put on the snowshoes and started out for deer. The boys chose their ground, and I decided to walk across the big pond and see if there were any moose signs in

the swampy land. I took Music along more for company than anything else. After getting over the ice I worked around a while and finally found the fresh track of a bull moose. He had been cropping some twigs for his breakfast, and must have seen me as I approached, for I could see from the signs that his departure had been sudden. He plowed a regular furrow through the soft snow, which yielded considerably to my snowshoes. Strange to say, the trail led over the hill and then worked over toward the place where the boys were still hunting. From the size of the hoof-prints, the marks of the antlers on the snow and the height of the saplings that had been trimmed I knew that if I ever got him I should be the boss moose hunter of Herkimer county, and I really hoped that my friends would not get a shot at him. They did not see the big fellow at all, but found his trail. Night was now coming on, and we decided to try the shanty again.

"In the morning the boys drew cuts, and Bill North was the lucky man. The other hunter didn't feel bad, because he had shot a nice fat buck early in the morning, and he hoped to have some sport around the clearing at odd spells between looking after my team and keeping a fire in the shanty. Bill and I knew that we were in for a long tramp, for when a moose once gets scared in these woods by a man and dog, he keeps going straight toward Canada for days and days, and we were afraid that this would be the case with our animal. We cooked up a lot of nice venison steaks, and each carried a large bag of quitcheraw, the Indian name for a mixture of maple sugar and popcorn pounded fine. Then we carried a pair of heavy blankets and I had my small saw and tomahawk. It was growing a little warmer and a slight rain had made a thin crust that would just bear Music, who naturally now felt very happy. All that day we tramped over hill and through hollow, but got no sight of our moose. We saw several deer, and once a black bear looked down on us from a ledge, but we pressed on in silence, until it was too dark to see. That night we hollowed a place in the snow at the foot of a large spruce by a rock and built a roaring fire, which we tended by turns all the long night through. The wolves howled some, and we occasionally heard the scream of a painter, but, protected by the fire and our good rifles, we felt no fear. Music whimpered occasionally when the concert got rather loud outside.

"The second day was much like the first, and along about noon Bill gave it up and started back, much against my will. He said he wasn't 'goin' tew foller no moose tew Canady fur ennybody.' He urged me to go back with him, but he might as well have talked to the wind. I was bound to catch a sight of that moose, and somehow I always felt that I should get him. That night I camped as before, but had only one blanket over me instead of two. However, I had to keep waking up to fix the fire, and the cold rather helped me in this respect. I missed my coffee those cold mornings, but there was a little flask in my pocket that helped things out somewhat. The worst of it was that the meat had given out, and a fellow can't tramp on quitcheraw for many days together. Along about 1 o'clock I found where the moose had made his bed, and a few broken twigs showed that he had snatched a hasty breakfast. As good luck would have it, I had his 'wind' all day, and by nightfall I felt that he must be within a mile or so. There was plenty of small game fairly asking to be shot, but the sound of a rifle would have made the old fellow leave in a hurry, so I had to starve myself again. Things were getting pretty bad for the dog, and he had only a small bone for his supper. At daybreak I was up and ready because I knew that it was to-day or never with me. The heavy outercoat and blanket were hung up, and dressed merely in a deerskin shooting jacket, breeches and moccasins, I put off after his highness once more. As the trail made a sudden turn, I saw where the moose had slept the night before. It wasn't 200 yds. from my camping place, but he was up and off before me, although his bed was still quite warm. I believed the old fellow was getting suspicious that he was followed, and that he would soon double on his trail to watch his back track, as these cunning animals often do when pursued. I therefore made a circuit to the left of what I judged would be his course for the next few miles. My plan worked to a T, for at about 9 o'clock I caught a glimpse of an enormous moose standing in some low bushes, and looking backward very intently. Somehow in trying to get a shot I snapped a twig, and my beauty was off in a twinkling. Music knew his business, and soon had the beast at bay. I took deliberate aim, but only wounded the big bull, who rushed straight for me. I had barely time to throw off my snowshoes and jump to the base of a huge hemlock, where there was but little snow, when the infuriated monster was upon me. I could see his wicked green eyes, and mane all on end, as he made his charge, and his hot breath fanned my face as I dashed behind the friendly tree. His great height and spreading antlers made it hard for him to get at me close to the trunk, and yet a single misstep on my part would have been fatal. Somehow I managed to get that powder horn open and rammed a big bullet home before he made his second rush. Music kept biting at his heels, and his attention to the dog probably saved my life, for I never could have loaded but for that. As the moose backed for the charge I let him have it right behind the point of the shoulder. It seemed as though he jumped roft. in the air, and then came down with a crash almost at my feet. I broke for another tree and got ready for him again, but it was no use. He was stone dead with a bullet through the heart. But where was Music. He couldn't have been tossed into a tree fork, as sometimes happens. It was a puzzle at first, but pretty soon a whine was heard, and the old dog emerged from beneath the monster's carcass, digging his way out through the snow. The moose in his death throes had fallen on the hound, and the soft snow had saved Music's life for more moose hunts with his beloved master.

"In less time than it takes to relate it, a fire was built, some tender moose steak was hissing from the spits, and Music and I, dog and man, gave thanks like true and tried hunting companions. It was no small chore to skin my game and hang up the splendid quarters out of the way of wolves and bears, but the job was

finally accomplished, and I took a cross-country course to the shanty, where I found anxious companions late the next day. They were of course rejoiced at my success, and soon had the meat into camp."

"They did a little more hunting around the pond," continued my father, "and finally arrived home in triumph; and your Aunt Hannah gave the sportsmen one of her famous game dinners. Among the guests was a politician from Albany, and Uncle Oliver humored his request for those horns to adorn the Museum at the Capital, where they are to this day."

Thus ended the story to us youngsters. My father, now seventy-eight years of age, but as active as many a much younger man, still resides at the old homestead in Ticonderoga. He is not a sportsman and rarely fires a gun. There is no hunting stock that I am aware of on either side of the house, but I believe that the emotions aroused in childhood by this often-repeated tale, which is now rescued from oblivion, had much to do with the writer's love for the forest and stream. PETER FLINT.

NEW YORK.

Just About a Boy.—XVIII.

"So that's Inyun Kara, is it? Well, that looks like a sure nuff mount'in aw right—on'y it don't seems 'ough it wuz very big, that is, not fer a mount'in," said the boy as he stood squinting through the purple twilight at the great bulk of Inyan Kara Mountain.

Our camp-fire glimmered with a daylight glare and a thread of blue smoke twisted lazily up toward the crimson and gold clouds, floating so high above us. The canvas tilt of the wagon was tinted with a warm, reflected light and the horses were munching the grass, which grew all over the flat valley of the boisterous stream.

The boy, arms akimbo and hat thrown back, stood feasting his eyes on the first real mountain sunset that he had ever seen.

"Say, gee! Looks most like you could hit that ole pine up 'n top that cliff with a rifle ball, don't it?"

I smiled as I thought of the distance and answered: "If you could shoot three times as far as you can and shoot straight enough, perhaps you could hit that tree—it is about nine miles up to where it stands, you see, and the very best you could do would be to throw a bullet a couple or three miles."

"Course I've read about how this here mount'in, air's mighty deceivin', but I didn't have any idee it was that bad. Why, a feller c'n see ever limb 'n ever'thing up there—it don't seem 's 'ough it was possible it's eight or nine mile up there."

"Well, you can see for yourself to-morrow just how far it is, for I've an idea we will camp up about the mouth of the cañon for a few days and run around afoot. There is a good spring up there, but it only flows a little way and sinks into the ground, the same as all the springs in this part of the world do. Wood is plenty, and there is a nice little glade there with plenty of grass for the horses, so we can stay as long as we want to.

"The reason I wanted to camp down here to-night was to give you a chance to see the big hill at a distance, and get the general lay of the land, for when you get up there you will find the whole landscape looking very different from what it does now. There are certain big cañons and cliffs which you can get located from here so you will have landmarks to go by, for you can lose yourself very easily up in the rough country, and find that camp isn't where you thought it was—everything looks so much like everything else, you know."

"Uh huh, I see. Feller sort o' wants to figger the main points out sost he c'n travel 'thout payin' much 'tention to th' rest o' th' country, 's that it?"

"You have the idea exactly."

The boy studied the rugged features of the silent old mountain until it lost detail and loomed up as a huge blue-black silhouette against the pink glow of the changing sky, and I suppose he thought the same thoughts that all outdoor people think when they look on the gigantic works of Dame Nature, and find how small men are, compared to them.

When the horses were brought in and the night grew old, we rolled up in our blankets there under the scintillating stars, and the boy had a lot of questions to ask, as usual, before we fell asleep.

"Gee," he said, "don't it seem still up here 'n this country? Nothin' on'y juss that tinkly noise o' water scootin' 'long down there over th' stones 'n th' creek—'n th' horses juss chompin' 'n munchin' th' grass like it was sponge cake er somp'n' good like that."

"Hear that coyote howl juss then? Seems 's 'ough he was forty mile fr'm here, don't it? That kind o' a soft noise like it comes a nawful long ways, on'y it's juss 's plain 's 'ough it was clost by, hain't it? Whut's er reason o' that?"

"Well, I suppose its the clearness of the air that makes it such a good conductor of sound. I have heard men talking in just ordinary tones out here when I could hardly see them. Of course I couldn't hear what they said, but I knew it was men talking. It was plain enough for that. I have heard grouse and other birds calling early in the morning, and they seemed to be right up close too, when in reality they were a long distance away."

"This sound business out here is like the distance—you are apt to have a chance to guess again before you get it just right. I remember once I heard a big landslide come down the side of a mountain in the night—"

"Whoa! whoa! Bill! Steady there, whoa, boy!"

"Here kid, you keep down. Don't jump up and show yourself that way. Keep down in the sage until we know what's up—may be Indians. Got your guns?"

"Yep."

"Keep low then and creep after me."

The horses were alarmed and snorting, and something was wrong in camp.

Silently we crept through the grass and sagebrush clumps of the creek bottom, keeping close to the ground, thus being pretty sure of concealment, and at the same time having the advantage over any man or animal that might be standing up, because they would be more or less against the light of the sky.

Suddeny I spied five gray forms hardly distinguishable from the surrounding brush, in the half-gloom of the night.

"S-s-sh! There they are! Loafer wolves—five of them. You take the one on the left and I'll take the right-hand side. Count three and give it to them," I whispered.

"One, two—crash!"

The rifles cracked with a sharp, spiteful sound, and a moment later the whole valley resounded with a cannonading of echoes mixed with snarling growls of pain and the snorting of the horses—pandemonium seemed to have broken loose in the quiet valley.

"Get the lantern—I'll attend to the horses," I said, as I groped my uncertain way toward the animals, being still half blinded by the flash of the rifles across the darkness.

In a few moments the boy came running back with the light and the trembling horses soon became quiet again and turned to their feeding as we went out to see what damage we had inflicted on the wolf pack.

First a still, shaggy form came into view, looking strangely white in the lantern light, but done for, as a big, dark patch on the shoulder indicated.

A little to the right was another, sitting up on his haunches with forefeet braced wide apart and bloody froth dripping from his fanged jaws.

If ever an animal looked the demon, it was that wolf there in the lamplight. His eyes blazed green and his ears were flat against his head, while the curved lips were raised in an angry snarl above the red jaw and its shining white row of pointed teeth. Bloody froth came from his throat, and the choking gurgle of a lung-shot beast was his defy to us as he half stood there, unable to fight back, but with the mental inclination to do so very much in evidence. Only a moment the savage picture lasted; then the muscular front legs trembled, his great head sank down, and he settled to the earth; a few rasping gurgles and a few twitches of the great muscles, and he was dead.

"Gee! here's another one!" shouted the boy, as he heard a little noise in the sage.

We ran toward this third one, crouching as well as he was able among the sage.

"He's back-shot," said the boy, looking down at the beast.

This one showed none of the anger or fight that marked the one just dead, but seemed rather to want to slink away and avoid us, being shot in such a way that his whole hinder parts were paralyzed.

The boy pulled his six-shooter, and advancing to within a couple of paces, shot the wolf behind the foreleg and finished his miseries. Then, gathering our trophies, we returned to camp, trailing them along behind us.

"Funny how that third one got it," said the boy, "I didn't see him. Did you?"

"No, I didn't, either. He must have been a little further back and in the shadow, and lined up with one of the others, I guess."

"Are they dangerous?" asked the boy.

"Well, no, not very, generally. Of course, if you happen to be caught out in a deep snow by a hungry bunch of them they would probably make pretty short work of you. They do not run in packs much, though, and are much more apt to be alone or in pairs than in any other way. I don't quite understand why they should be together here at this time of the year, unless there is a carcass somewhere near. They kill a great deal of stock and some game and feed on any carcass that they find."

"They are what the old hunters call the buffalo wolf, because they hung along the flanks of the buffalo herd, waiting to pull down the calves or the old creatures. The cow men call them loafer wolves, for some unknown reason, and the 'wolfers' who roam all over this plains country call them loafers, to distinguish them from coyotes and timber wolves."

"Now let's turn in, and we can take the pelts off in the morning."

EL COMANCHO.

Winter in the Rockies.

I AM just back from a month's trip on ski through the Big Gros Ventre and Jackson's Hole countries. Three of us, Will Hill, Ed. Hill and myself, with eleven dogs, started just before Christmas; the trip was partly to hunt cougars, partly to see how the elk were getting along, and also to have a good time. Going over the divide between Green River and Gros Ventre we only found about 1 ft. of snow, and kicked ourselves because we had not come on horseback. On top it began to snow hard, the wind coming right in our faces. Here Frank Nichols, of Jackson's Hole, who was with us, broke a snowshoe, which is always a good thing to do. But he patched it up and we kept on. On the Gros Ventre side there was only about 6 in. of snow, and, as what of the surface did not have rocks sticking up was all pawed up by the elk, the snowshoeing was not first class. So we got to Lloyd & Robinson's ranch that night pretty tired. Did not see any elk that day, as the snow was not deep enough to keep them out of the timber during the day.

The next day we went down to Fred Koener's trapping cabin on Crystal Creek, and on the way saw several hundred, maybe a thousand elk along the Gros Ventre. Fred was not at home, so we ate up all of his grub that we could, and the next morning pulled out down the Gros Ventre. Soon we began to hit cougar tracks, and about 10 o'clock, a track heading the same way we were was too much of a temptation, and we turned the hounds loose. We didn't have a gun in the outfit, calculating to knock the cougar out of his tree with rocks and let the dogs finish it.

To make a long story short, about 2 o'clock the dogs had the cougar bayed on a ledge of rocks about six miles below where we turned loose. The dogs could not get at him, and in going around the ledge to find a way to get up, picked up the fresh trail of another cougar and went after that one down the creek. The first cougar went away close to Will Hill, who was on top of the ledge, but as he had no gun the big cat got away safely.

So we lit out after the dogs, and just at sunset came to where they had the second cougar up a tree in the cliffs on the north side of the Gros Ventre, just above the Devil's Elbow. We had lots of fun with that cougar. Lloyd, who was with us, belted *Felis concolor* with big rocks till he jumped, but the ground was so rough that the dogs could not catch him. Hector, the half-bred staghound, got his favorite quartering dash and tail hold, but went headlong into a tree before he could

throw the cougar. We repeated the rock-throwing act twice, when the cougar got in a big spruce, and the more rocks we threw the higher he went. By this time it was dark, so Ed. and I built some fires and went into camp, while the rest of the boys went down to Albert Nelson's four miles below, Will Hill saying that after supper he would come back with a gun and some lunch. This was Christmas Eve, and I will bet that not many hunters in the United States had one like it. We had three big fires going, one at the foot of the tree up which the cougar was. Ed. and I sat on the big roots; overhead the cougar lay on a limb and watched us; the dogs lay around in beds they had dug at the foot of trees, and the blazing fires lighted up the dark cliffs overhead.

Along about 10 o'clock Will got back with a quart of coffee, a lot of sandwiches and a No. 12 shotgun. The coffee and lunch was all right, but the gun was not. The right firing pin was gone and the left one was broken, so that the gun had to be held muzzle up when loading or the pin would drop out. After we had filled up, I took the artillery, the cartridges being loaded with No. 4, and tried to spot that cougar. I want to remark right here that shining a cougar's eyes is not what it is cracked up to be. The moon was up, but nary cougar could I see. At last I figured where he ought to be, and a charge of shot brought forth a great spitting and thrashing of branches. So I kept the gun going as fast as I could, and at the fifth shot down he came. We could not tell whether he was dead or not when he hit the ground, but he was dead enough when we got the dogs away. When we took the skin off, talk about pepper-boxes; five loads of No. 4 at 15 yds. make a whole lot of holes in a cougar. Will took the skin in his pack sack and we got into Nelson's at 12:30, but feeling O. K.

The next day we went down to Frank Peterson's, who was one of the party to climb the Grand Teton last summer. Frank tells a very interesting story of the top, and I am free to confess that my head is too soft for that kind of work.

The next day we went down to Will Simpson's getting there in trim for the Christmas ball of the Jackson's Hole Gun Club, which was held at their club house. We had to take in the ball in snowshoe dress, sweaters, overalls and moccasins, because when a fellow is snowshoeing he does not carry any extra clothes along.

Nearly every one in the Hole is pretty well stirred up over the proposed extension of the Yellowstone Park, which would not only take in about half of the agricultural land of the valley, but all the grazing land bordering the Hole. A mass meeting was held Jan. 26, and by a unanimous vote resolutions were adopted protesting against any enlargement of the Park or the formation of a new park. Jackson's Hole proper is nearly all farming land, with very little grazing or timber land, and if the settlers are deprived of the use of the grazing and timber land north and east of the valley, it will be an almost fatal blow at the stock-raising interest, which is becoming an important one. The same is true of the valley of the Upper Green River, and the State of Wyoming will make a great mistake if it allows this project to go through.

As regards the game question, and especially the elk, the situation is this. There are in northwestern Wyoming and the Park between 50,000 and 60,000 elk, perhaps more. I understand that there are about 10,000 elk in the Park this winter. There are about 20,000 on the Big Gros Ventre, 10,000 in Jackson's Hole, and 10,000 on Green River and the desert. Nearly half of these elk summer in the Park, and the balance are practically undisturbed during the breeding season. This means that somewhere between 5,000 and 10,000 calves are raised every year. This is enough to supply all legitimate demands. At present these elk are well protected. The Jackson's Hole people are doing all in their power to stop all violations of the law. On Green River the state of affairs is not so good. The elk that go to the desert to winter will not last long, as the people down there make no effort to protect them. Below Rock Creek, what with the Rock Springs Lumber Company, which has been feeding a couple of hundred men on elk meat all the fall, and the slaughter of elk by the ranchmen, the elk have been going pretty fast. On the upper river, between Rock Creek stream and the lakes, the elk are wintering well and have not been disturbed, as we gave the lumber company's hunter to understand that any hunting in that section meant trouble.

As matters stand now, the elk ought to hold their own. Of course, the Bannocks and Shoshones still come over and kill cow and calf elk by the hundreds every fall, but a row like the trouble in Colorado in '87 and '97, and Jackson's Hole in '95, is breeding, and that will clear the air in that direction. Last year the Indians drove off one game warden by show of force, but that will not happen again.

Now, if the Park is enlarged, this is what will happen. The elk will be protected on all their summer range. No one will be able to get any elk hunting, as the elk will not be out of the Park during the open season. Result, the elk will increase very rapidly; they will soon eat up all the feed, and the first hard winter the bulk of them will starve. I do not see the use of stopping elk hunting, which benefits many, in order that every four or five years 30,000 or 40,000 elk may starve to death. The elk herds are now as large as the range can support, and I fully expect to see a big loss the first hard winter. What we want is not a big park to protect the elk, but a reasonable effort to enforce what laws we now have.

When we came back the elk herds were down on the Big Gros Ventre, and it was a sight worth seeing. For forty miles elk were in sight as far as one could see. The bands numbered from 100 to 1,000 elk, and one herd, on the ridge between the Gros Ventre and Fish Creek, covered a tract of country one mile by two. We estimated 5,000 elk in that herd alone. Many of the elk were so tame that they would hardly get out of our way, and all the elk that we saw looked well, as there was not much snow and grass was plentiful. There is no fear that the elk are going to disappear very soon, and all that Wyoming wants is a just game law, fairly enforced, and we will have elk hunting for all time.

I forgot to mention that we only got four lions on the entire trip, so it was not much of a success in that line.

WM. WELLS.

"Forest and Stream" Contributors.

Editor Forest and Stream:

In the pleasant reminiscent letter of your contributor, Bristol Hill, the names of some old contributors are omitted whose articles were always eagerly looked for by your readers.

Among them was Maj. Sarasota, who wrote some very entertaining descriptions of hunting in Florida. I especially remember one in which he told of a man-eating shark following his canoe for miles, trailing it by the blood of a deer that dripped overboard. Poor Sarasota went long ago to his final rest, but he is not forgotten.

Then there was H. P. U., whose "Bear that treed Jimmy O'Brien" was, it seems to me, enough to immortalize any writer. He was as tenderly poetic as he was humorous, as his contributions attest.

There was also O. O. S., always bright and interesting and vividly descriptive of all his observant eyes beheld. Who has forgotten his inimitable panther story, told so circumstantially that it made the chills creep up one's back. Alas, they are gone, and there are none left like them. They were my dear friends, though I never met them, and the death of each came to me as a personal loss. Ufford, Smith, the Editor and I used to carry on an absurd roundabout correspondence, in which all manner of imaginary adventures were related and momentous questions settled. Ufford, in his last days, wrote a letter to Antoine from a Cajan relative, and two days before Smith's disappearance he wrote me most cheerfully and affectionately, though he was silently suffering mortal agony, and a little while before had sent me a beautiful collection of sea mosses from Hood Canal, beneath whose waters, perhaps, he sleeps. He was always doing something to lighten the gloom that encompassed his blind friend, and these last mementoes of his unselfish love are very touching, as are a handful of wild flowers, spring beauties, that Nesmuk crept forth to gather for me the last April he ever saw.

He was a unique character, this old woods loafer as he called himself. Sometimes one wonders if Nature does not miss and grieve for such lovers as these men were. But she has not lost them; only drawn them a little closer to her heart, and they know her secrets, that to us are a sealed book.

I greatly miss the quaint, racy wood notes of old Jock Darling, and I wish that some of the living contributors wrote oftener. Kelpie, Kingfisher, Piseco, Tarpon, Dr. Morris, Manly Hardy, Orrin Belknap and the veteran Von W., and many others, close observers and practical men, who never write but to instruct and entertain. They should not let their secrets die with them.

AWAHOOSE.

Natural History.

Reason and Instinct.

Editor Forest and Stream:

Although Mr. Fred Mather will not get the Donnybrook out of me that he seems to hanker for, still I feel forced into disputing his views, as both erroneous and mischievous; for if my contention that none of the lower animals reason in kind, as man does, is correct, then great injustice is inflicted on those animals by claiming reason for them. Had the owner of the mastiff Blank Boy clearly recognized the limitations of the dog's intelligence he would not have trained the dog to keep all strangers away from his child's perambulator, and the mastiff would not have attacked another child who persisted in coming to the perambulator after repeated warnings from the dog. The poor dog was but a dog, after all, and did his duty as he saw it.

Now, I hardly feel that Mr. Mather has a right to set up a definition of his own for reason, and it is only fair to take accepted ones. Webster's seems just and fair—"to deduce inferences justly from premises." Now, the first and most conclusive proof that animals do not reason as man does, either in degree or in kind, is the fact that there are many acts of reasoning, so simple that the lowest savage comprehends them, that no animal has ever shown ability to carry out. Animals will hover around an expiring fire, enjoying its warmth, but never attempting to keep up the source of their enjoyment by pushing the expiring brands on the fire. The cow is consoled for the loss of her calf by its hide, stuffed with hay, being given her to snuff at (and will eat the stuffing out of the hide). The bitch will accept yellow foster-pups among her jet black ones, if they have been cuddled up with her own long enough to get their smell. I think it will be admitted that human reason of the very lowest order is infinitely beyond the mentality shown by animals in these points.

Now let us consider the acts Mr. Mather cites as evincing reason in the animals—the fice dog calling assistance to his injured master will answer as well as any. Let us admit for illustration's sake that the act of the dog proceeded from reasoning. Then the mental process of the dog would be, "My master is hurt; he cannot help himself; I cannot help; men can help him; I must go and get men here." On meeting the men: "I must behave so as to attract their attention, and by running from them, induce them to follow me to my master." Is this not a very much more complicated chain of reasoning than the one that might have induced the dog to keep himself warm by pushing the ends of unburnt embers into the fire, or the still simpler matter of how the female could effectually defend herself? Therefore, if the dog, most unquestionably is incapable of an act requiring much less reasoning power than involved in the course Mr. Mather claims as a result of reason, why infer reason as the source until other explanations have failed? Dogs certainly—and other animals probably—possess sympathy; the dog sympathized with its master; that sympathy made it anxious and distressed; its distress led it to go away from its master, and its own desire for sympathy led it to the spot where men were; then its anxiety caused it to behave as it did, and in its mixed feelings it adopted the course of conduct that led Mr. Mather and his companion to the help of the dog's master. Which of the two explanations is the

more logical (remembering the stubborn fact that the dog was certainly incapable of acts requiring less reasoning powers than the process of reasoning out aid for its master)?

Mr. Mather says: "The man who denies reason to the dog has never trained or studied a dog." Now, even at the risk of a sure-enough Donnybrook, I flatly deny that statement. I have bred, kept, used, studied and loved dogs for forty-five years at the least; I have had dogs of as high natural intelligence as any I have ever read reliable accounts of, and I have had many dogs perform as wise acts any I have seen reliably stated; yet I never saw an intelligent act in one of my dogs that was not readily accounted for by its previous acts and experiences. One instance will suffice to illustrate the whole class of acts that are generally attributed to reasoning without any justification therefor. Nep came to a door carrying a stick in his mouth too long to go through the door, and after many failures, laid it down, and after a bit picked it up by one end and dragged it through. Now there was not a spark of reasoning in that, and I am not quite sure that it was particularly intelligent. Nep had long known that he could drag a heavy stick by an end when he could not carry it, and being tired by his repeated efforts to get the stick through, resorted to his tired method.

It occurs to me that a still stronger case than that of wounded birds might have been cited by Col. Alexander against the theory that wounded or frightened animals transmit their fear of man to succeeding generations, if it is true that the alligator of the South was very ferocious when first known to civilized man, and has now become very timid, for I believe that the saurians pay no attention whatever to their young, and therefore could not instruct them. But it would seem a sensible theory that one frightened animal displays its fright to others of its kind who have not had its experience, and they learn, by imitation, from that experienced one. Anyhow, that is rather a better guess than the instructing one.

W. WADE.

OAKMONT, Pa.

Introducing the Skylark.

Editor Forest and Stream:

In regard to answering your interrogatory in your issue of the 20th inst., will first state that the skylark (*Alauda arvensis*), which is famed for the beauty and power of its song, is found throughout Europe. It is about 7 in. in length and of plain brownish colors. It does not alight on trees, but lives on the ground, where it builds its nest. Lays about five eggs of a grayish color, sprinkled with brown specks. In some parts of Europe it is used as food, and it is said to be an excellent little bird for this purpose. Statistics inform us that five millions were brought annually into Leipsic, and the official return states that during the winter of 1867 and '68 one million and a quarter were taken at Dieppe, France. An attempt was made here (Cincinnati) about twenty-five years ago to introduce the skylark and several other species of European birds, but it only succeeded in the case of one species, viz., the sparrow, an unmitigated pest, whose worthless character has been shown. The injury done by this anarchist vagabond among birds is far-reaching and very great, principally in driving away our beautiful native birds, depriving us of their aid in destroying insect predators, and beauty and charm of their plumage and song.

The society who imported these birds called themselves, I believe, the Cincinnati Acclimatization Society, Armin Tenner, secretary. The skylarks liberated by them on one of the hilltops west of Burnet Woods Park lived two or three years and then disappeared. I have often heard them sing there. Introducing birds into a new country is a very risky and doubtful experiment. In some rare cases it is of value, but in a majority of cases is disturbing and injurious to the fauna of the country imposed upon. The bird fauna of North America is one of the finest in the world, and should be protected and encouraged, and not interfered with in any way. I cannot find words strong enough to condemn the habit of introducing all sorts of animals into our country, without regard to the desirability of the species. It is unwise and unpatriotic.

The European sparrow, the Hessian fly, the cabbage butterflies, etc., will do more damage a thousand times over, than all the desirable species will do good.

No bird has received greater attention from the literatures—prose and poetic—than the skylark. Prof. Wilson, glorious "Kit North," the "Old Man Eloquent," famed alike for feats of herculean strength and daring, and for scholastic accomplishments, the deer-stalker and the salmon-spearer, the learned professor of languages, the acute critic, in writing of this delicious songster, says: "Higher and higher than ever rose the tower of Belus, soars and sings the lark, the lyrical poet of the sky. Listen! and the more remote the bird, the louder is his hymn in heaven. He seems in his loftiness to have left the earth forever and to have forgotten his lovely nest. The primrose and the daisies and all the sweet hill flowers must be unremembered in the lofty region of light. But just as the lark is lost—he and his song together—both are again seen and heard wavering down the sky, and in a little while he is walking contented along the furrows of the braided corn or on the clover lea that has not felt the plowshare for half a century."

No less full of the true poetry of nature, and of a healthful sentiment of morality, is that passage in the writings of Washington Irving, which runs thus:

"Of all birds I should like to be a lark. He revels in the brightest time of day, in the happiest season of the year, among fresh meadows and opening flowers, and when he has sated himself with the sweetness of earth he wings his flight up to heaven as if he would drink in the melody of the morning stars. Hark to that note! How it comes thrilling down upon the ear! What a stream of music, note falling over note in delicious cadence! Who would trouble his head about operas and concerts, when he could walk in the fields and hear such music for nothing? There are homilies in Nature's works worth all the wisdom of the schools, if we could but read them rightly; and one of the most pleas-

ant lessons I ever received in time of trouble was from hearing the note of the skylark."

This is not all, for the poets have fairly idolized this bird in mellifluous verse as if it were the most valued thing on earth. Shelley's magnificent ode to the skylark is in most delicious stanzas. Hear him as we quote but a few of his verses:

"Hail to thee, blithe spirit!
Bird that never wert,
That from heaven, or near it,
Pourst thy full heart
In profuse strains of unpremeditated art

"Higher still and higher
From the earth thou springest
Like a cloud of fire;
The blue deep thou wingest,
And singing still dost soar, and soaring ever singest.

"In the golden lightning
Of the sunken sun,
O'er which clouds are brightening
Thou dost float and run,
Like an unembodied joy whose race is just begun.

"The pale purple even
Melts around thy flight,
Like a star of heaven
In the broad daylight
Thou art seen, but yet I hear thy shrill delight.

"What objects are the fountains
Of thy happy strain?
What fields or waves or mountains?
What shapes of sky or plain?
What love of thy own kind? What ignorance of pain?

"With thy clear keen joyance
Langour cannot be;
Shadow of annoyance
Never came near thee;
Thou lovest, but ne'er knew love's satiety.

"Waking or asleep,
Thou of death must deem
Things more true and deep
Than we mortals dream,
Or how could thy notes flow in such a constant stream?

"Better than all measures
Of delightful sound,
Better than all treasures
That in books are found,
Thy skill to poets were, thou scorner of the ground."

This is indeed a glorious tribute of admiration, a meed of song such as has been seldom offered to bird or other living creature. How rich it is in poetical imagery, how full of power and pathos and passionate energy of feeling; the stanzas which we have omitted are fully equal to those quoted, and the whole poem is the most perfect thing of the kind that we know of, except, perhaps, Keats's exquisite ode to the nightingale.

James Hogg, the Ettrick shepherd, the plaided mountaineer, also takes up the lay of the lark in a merry, inspiring strain, as follows:

"Bird of the wilderness,
Blithesome and cumbersome,
Light be thy matin o'er moorland and lea!
Emblem of happiness,
Blessed is thy dwelling place!
Oh! to abide in a desert with thee!

"Wild is thy lay and loud,
Far on the down cloud;
Love gives it energy, love gave it birth.
Where on thy dewy wing,
Where art thou journeying?

Thy lay is in heaven, thy love is on earth,
O'er fell and mountain sheen,
O'er moor and mountain green,
O'er the red streamers that herald the day,
Over the cloudlet dim,
Over the rainbow's rim,
Musical cherub, hie, hie thee away!

"Then when the gloaming comes,
Low in the heather blooms,
Sweet will thy welcome and bed of love be!
Emblem of happiness
Bless'd is thy dwelling place!
Oh, to abide in the desert with thee!"

Who would not take his stand on the breezy hilltop with Milton

"To hear the lark begin his flight,
And, singing, startle the dull night,
From his watch tower in the skies,
Till the dapple dawn arise."

To join with Shakespeare's splendid burst of exultation—

"Hark! hark! the lark at heaven's gate sings,
And Phœbus 'gins to rise
His steeds to water at those springs,
On chaliced flowers that lie."

And to listen to the voice of some dainty Ariel or unseen spirit of nature, which goes floating over hill and valley, singing:

"Lo! here the gentle lark, weary of rest,
From the moist cabinet mounts up on high,
And awakes the morning, from whose silver breast
The sun riseth in his majesty;
Who does the world so gloriously behold,
The cedar tops, and hills seem burnished gold."

Volume after volume might be filled with odes, poems, idyls, madrigals, sonnets, etc., to the beautiful songster that soars on highest wing, but enough has been introduced in this article to acquaint the bird lovers with the musical qualities of the sky-flying bird that soars up, up, to the very fount of light and truth.

ALEX. STARBUCK.

The Forest and Stream Publishing Co. are the largest publishers and importers in America of Books on Outdoor Sports. Their illustrated descriptive catalogue will be sent free on request.

The Quebec Elk.

NEW YORK, Feb. 23.—*Editor Forest and Stream:* Referring to the article in the last number of FOREST AND STREAM, reporting the killing of an elk in the eastern Province of Quebec, I beg to submit the following, which, taken in connection with that occurrence, proves conclusively to my mind that there are still a limited number of wapiti in eastern North America.

In December, 1897, a man named Thompson, a camp boss for A. E. Alexander, of Campbellton, New Brunswick, claimed to have seen two elk in the mountains of Restigouche county, New Brunswick. They were in the portage, near Hall's hay sheds, about twenty miles from Campbellton, and seven miles from Indian Lake, famous for trout. Thompson says that he first saw the tracks in the snow, then heard one of them whistle, and afterward succeeded in getting within a few rods of the elk before they made off. He had no gun, or he could easily have shot them both. There can be no question about the animals being elk, as Thompson has lived in the far West, seen them in droves of hundreds, and therefore knows them well.

The locality where the two elk were met by Thompson is rather less than fifteen miles from the Bay des Chaleurs, which separates New Brunswick from Quebec, and therefore but a short distance from the locality the elk was reported to have been shot.

NOAH PALMER.

SHELDON, Vt., Feb. 25.—*Editor Forest and Stream:* The information given in your editorial of this week—about an elk being killed recently near Matepedia, Que.—is most interesting, and to me a satisfactory solution of a puzzler that has disturbed me not a little.

Late in the fall of '97 I reported through your columns that an animal somewhat resembling a moose made a hurried passage through this country, coming from the south, and going in a northeast direction into the Province of Quebec. A fox hunting friend, who first saw it, believed it to be a hybrid—a cross between a moose and our common deer. The writer followed it, or rather raced it over into Canada, and from the description given by the numerous persons who saw it, was unable to decide whether it was a moose or caribou. Its general color was described as "dunnish brown," and its gait and size resembled a moose. The track was shorter and broader, and its horns, though not large, were not palmed. It was without doubt an elk that had escaped from some game preserve south of here, and when at liberty headed northward, and succeeded in escaping the Vermont and habitation pot-hunters, to be gathered in later on, down near the Bay Chaleurs. We found where over a score of shots had been fired at it, apparently without effect—a lucky thing for the shooters.

Quite a number of deer are wintering in this vicinity, which the wardens are trying to protect. The number of hounds being lessened every few days, and their owners will be taught a lesson that will be beneficial. In the end game protection and order will prevail. It don't pay, boys, to run deer with hounds in Vermont.

STANSTEAD.

Elk Remains in Vermont.

MILTON, Vt., Feb. 23.—*Editor Forest and Stream:* In the last issue of your paper Ernest Seton Thompson asks for information regarding the distribution of the elk. Although elk probably have not formed a part of Vermont's fauna for several centuries, at one time they certainly had an abiding place here, as is proven by remains that have been found near here, which were, I am confident, of that species.

The remains consisted of a very fine pair of antlers measuring, I should say, 6 ft. from the skull to the tips, with a spread of some 6 ft. These figures may not be quite correct, as I do not possess the exact measurements. A large bone, evidently a hip bone, and a portion of a broken antler were found with the pair.

Where they were unearthed was in a small sheet of water, that could hardly be called a pond. The action of the water, no doubt, strongly impregnated with iron, had turned their color nearly black, and rendered them as hard as stone. The vicinity has been searched for more remains, but to no purpose, as these were all that were found.

KENEWAH.

Breeding Habits of Bears.

IN Mr. Brown's letter, published in FOREST AND STREAM of Feb. 4, he asks for information as to the number of cubs bears have at a litter. I have twice found a she-bear with four cubs with her. In each case the mother was a brown, or cinnamon, bear, and in each case one cub was black, one dark brown, and the others lighter shades of brown, one being almost yellow. This was in Colorado.

Several times I have seen three cubs in a litter, though it is true that the usual number is two, and I never saw but one black or cinnamon she-bear there with all her cubs the same color, the exception being a black she-bear with two cubs. I never saw but one grizzly with more than two cubs; she having three. As to the breeding season and period of gestation, that is something I never could settle to my satisfaction.

It is commonly supposed among trappers that bears breed just before holing up. I have held a post mortem on a dozen or fifteen she-bears during September and October, and could never find any evidence that impregnation had taken place.

At the same time, during the first two months or so the indications may be so slight that no one but a specialist could discover them.

As to bears hibernating, I think that when a bear is in his natural state he makes his den where it gets completely snowed under, and that he remains torpid for about three months, say December, January and February. That is, of course, here in the mountains. In the bad lands bears stay out nearly all winter. But I notice that tame bears here in the mountains are more or less lively all winter, and take some food.

WM. WELLS.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

Skunk Lore.

BARRE, Vt., March 1.—*Editor Forest and Stream:* As several writers have given in their testimony on the antics and habits of this "varmin," I wish to add my youthful experience and observation of it.

The old theory of holding the skunk by the tail to avoid scenting originated, it is said, with the Indians, and their favorite method of catching it was for one to advance in front, keeping the finger rapidly moving in a circle, while a second individual approach it in the rear, and quickly grasped its tail and raised it from the ground. By following this method my brother found himself in full possession of a real live skunk, and it was carried some distance without scenting. But while held in an off-hand position with a .32 caliber cartridge in its brain, it discharged its fluid as effectually as if on the ground. Therefore we no longer follow this Indian method.

Skunks captured in box traps and sunk carefully beneath the water and drowned, seldom scent. A good method of removing them from the cellar or room is to chloroform them; this can be easily done without any danger. My experience makes it evident that skunks seldom use their weapon against one of their family, for during the rutting season I have found them killed in the traps by one of their kind. Some skunks are more "touchy" than others, so to speak. While one will allow you to drag it a long distance, another will not permit you to touch even the chain of the trap without scenting. It also seems that a skunk that gets hurt or into trouble, if in no way associated with an enemy, seldom scents. Again, I know a party who captured fifteen in a dead fall—not a log trap, but a flat stone placed upon edge and set with a figure 4—not one of the lot scented, and the skins were as clean to handle as a fox's pelt. B. A. E.

The Linnaean Society of New York.

REGULAR meetings of the Society will be held in the American Museum of Natural History on Tuesday evenings, March 14 and 28, at 8 o'clock.

March 14.—Annual meeting. Election of officers for ensuing year.

Eugene Smith.—"The Turtles and Lizards of the Vicinity of New York city."

March 28.—Ernest Ingersoll. "Scenery and Life in British Columbia."

By Members.—"The Warblers of North America." Exhibition of specimens, with discussion of distribution, habits, etc., of magnolia, cerulean, chestnut-sided, bay-breasted, black-poll and blackburnian warblers.

WALTER W. GRANGER, Sec'y.

AMERICAN MUSEUM OF NATURAL HISTORY.

Game Bag and Gun.

Proprietors of fishing and hunting resorts will find it profitable to advertise them in *FOREST AND STREAM*.

The Pennsylvania Law.

OFFICE OF THE BOARD OF GAME COMMISSIONERS, Harrisburg, Pa., Feb. 28.—*Editor Forest and Stream:* The Game Commission of Pennsylvania, through their secretary, most respectfully request that your influence be used to secure the passage of the three following House bills, "An act to make constables fire, fish and game wardens ex-officio"; "An act to correct a supposed defect in the present title of our game laws," and "An act appropriating money for the enforcement of the game laws," and to oppose all other amendments to the said act of 1897, unless the same have the support of this commission, which is the representative of organized game protection in the State.

As you are aware, the act of 1897 was the result of over two years' labor given the subject of game protection by representatives from many organizations for that purpose throughout the State, men who realized that something must be done, and done quickly, to save the game birds of our State, such as the pheasant and turkey, the quail and woodcock, and that noble game mammal, the deer, from absolute extinction, at the hands of the market-hunter within our borders, and the hordes of hunters from other States, as well as the insectivorous and song birds from the irresponsible hunter, who, when allowed to carry a gun, shot anything and everything that chanced to appear before him, whether the same was in season or out of season, fit for food or not. The members of these associations, composed of judges, lawyers, physicians, merchants, mechanics and farmers, men from all walks of life, numbering at the time of the passage of the act of 1897 fully 10,000, and to-day twice that number, in the State, and having no interest save the perpetuation of these birds and mammals, labored to formulate a bill that would accomplish the desired end with the least friction in the different sections of the State. After many meetings and a thorough consideration of all interests, they drafted and secured the passage of the present law, which they then thought, and still maintain, to be the best law for its purpose on the statute books of the Commonwealth. To secure a uniform law it was necessary to give and take. The representatives of these organizations who enjoyed a day in the field with gun and dog (and there are many members who never shoot), presented the claims of their different localities—those who enjoyed squirrel shooting desired the season to open Sept. 1, but admitted that untold numbers of young pheasants and quail were killed by men who ostensibly were hunting squirrels. The pheasant and quail shooters, especially from the southern tier of counties, desired a late season, not earlier than Nov. 15, but also acknowledged that this was too late for successful squirrel hunting, so, to further uniform protection, those advocating an early opening of the squirrel season gave their time, and to allow an equitable adjustment of the season the pheasant and quail shooters waived their claim to the late opening, and Oct. 15 was decided upon as the most just to all, thus all questions were settled

after a careful consideration of the rights and equities of the several sections of the State; the time for shooting was limited to two months, thus closing the season before the snows of winter exposed the retreat of the different kinds of game, thus preventing its increased slaughter.

Evidence from unquestionable authority was presented, showing that the market-hunter was the most dangerous of all enemies to game; testimony was produced showing that this class of men started with the opening day of the season, and canvassed the country with horse and wagon until its close, moving as occasion required, and killing from forty to seventy pheasants a week, and even beyond that number. One man was reported to have killed ninety-nine pheasants in one week, and another of making a total of 1,400 pheasants for the season. Quail were slaughtered in the same way. Pheasant's nests were found by the aid of dogs, and the eggs sold to photographers at high prices, because of the valuable quality of their albumen. Evidence was produced showing that when the woodcock season opened in July and continued through the year, orders for game were received by market-hunters to "ship all the woodcock possible, we will also take all the young pheasants you can send." Deer were killed by the aid of dogs, contrary to existing law, and without an effort upon the part of any one to prevent it. Because of these facts the clause prohibiting the sale of pheasants, wild turkeys, quail, woodcock and deer was called into being; the sale of no other species of game is prohibited within the State, and the section forbidding the shipment of all game out of the State was to close the door against possible violations with reference to the above named birds and deer.

Not only is game protected by the act of 1897, but also the farmer, who has but short and limited time through which he must contend with irresponsible persons, who under the name of hunter, open his gates, destroy his fences and shoot his poultry, and for the same reason reduces the possibility of forest fires that are so frequently, whether justly or otherwise, charged to the hunter.

Reports from all over the State indicate that the act of 1897 is giving protection to an extent never before realized in this State, and that game of all kinds, with insectivorous and song birds, is on the rapid increase; therefore, in the opinion of this commission, the game laws of 1897 should not be altered or amended for the gratification of the people of any special locality of the State, and we therefore ask your help to defeat all measures bearing upon this act, except as before stated.

JOSEPH KALBFUS, Sec'y of Game Commission.

Another Old Gun.

THE last time I saw the old gun was on my last brief play-spell, back in '97. One barrel is bursted, one hammer lost, breech shaken, stock all scarred and battered with hard usage, but I would not exchange the memories connected with that old gun for a pair of Mr. Anybody's best make, with all modern contraptions.

My first endeavors on the hunting field were made with a double muzzle-loader, my first day with which was devoted to carrying around a loaded but useless gun, for, woe inexpressible, I forgot the caps. But soon I grew able to be trusted with my father's gun, then a fine new shining creation.

My first ducks fell to the clang of this dear old gun. I see yet the excitement with which my side-partner, age sixteen, rushed into the pond waist deep to get those four little blue-winged teal. I got 'em all on the wing, too, and carefully concealed my intense joy and surprise at the two pretty doubles. That was a red-letter day—one of those days one never forgets. Ten years have gone over my head quicker than the sound of those four thrilling splashes.

The old gun and I passed through many of those delightful vicissitudes of cold and rain and snow, which we never heeded, so long as there was success, and which we have long forgotten. But one day—a dreadful day I thought it for a long while—egged on to get out at 3 o'clock in the morning, a Dutch boy and I went hunting on the prairie. We didn't see, hear or believe there was anything to shoot till after 10 o'clock; then we sighted a flock of mallards on a little pond in a hollow. He went one side and I crept flat on my face down a little, low, stone fence on the other. Three hundred yards on my stomach through a muddy field, and the old gun and I are within range. I jump to my feet, yell, end as the fluttering, splashing crew of green birds rise I fire twice right into the brown. Not a thing results except accelerated speed on the part of that beggarly lot of measly ducks. With rage I throw the breech open to slip in fresh shells and my left hand run against a jagged piece of steel; the right barrel had blown out about 14in. from the fore end. There had been gin. of Missouri mud in the muzzle, and it couldn't stand the pressure. The left barrel, for some mysterious reason, is unhurt.

My heart was broken. I turned back homeward without one glance at those cussed birds. My father never said a word when I showed him the gun, but gently took it and slipped it into its case. His heart was broken, too.

But that didn't finish the old gun. As the loss of an arm is said to result in double strength for the other, so the left barrel of the best gun in town seemed to have acquired double efficiency; it was the deadliest left barrel I ever knew. And even now, when a third lot of shooters, my younger brothers, are learning on the old stand-by, that left barrel has lost not a twinkle of its old-time power.

The brightest day of the many bright ones I have to look back upon in my hunting experience I had with only the poor, old, battered gun as my artillery. Nine teal a-wing, nine single kills in less than fifteen minutes of a sunshiny October afternoon. My boy's heart had never had so glorious a swelling, and my man's heart beats faster now, as I think of it. Little thing as it is, when one has something like that to think of it makes "chained to business" a deal less galling.

The old gun can't be bought; it has earned its asylum; we all of us have killed our game with the Peter's gun, and we all wouldn't bear the parting with it. I'd most rather shoot the old gun with the useless metal to carry than I would the new, shiny, hammerless so lately first my own.

A. E. H.

The Storm and the Birds.

Editor Forest and Stream:

That exquisite gem of art, a stately and intrepid moose in that picturesque and vigilant attitude, as if ready to cope with any emergency, either to defy an enemy in encounter, or to secure safety in flight, arrived at its proper destination 25th inst., to be appreciated by the recipient, who attributes the delay to the irregularity in the mail from the inclemency in the weather.

The recent unprecedented and continued excessive cold weather of 6 to 8½ degrees below zero, that prevailed in this locality during about the middle of this month, was productive not only of many distressing and unpleasant features to those residing here, but was somewhat disastrous to game, which suffered from a limited supply of available food; many birds and small animals perished, being frozen dead when found. The wind, rain, sleet, snow and zero weather combined were destructive to the life of the game, as the wind and rain blew and beat out the seed, the sleet froze the surface to such an extent that it rendered the food inaccessible. The birds and animals that survived this arctic condition were not in that most excellent condition that would invite the fastidious palate of an epicure.

After abatement of the intense cold, and when the weather assumed a more temperate character, those who, inspired by the zeal of sport, varied the monotony of the times by engaging in a hunt, found in some instances an entire small covey of partridges (quail here) frozen in groups; and fragments of coveys still in existence. Quite large coveys of birds were observed collected together when the sleet first began, and those witnessing this spectacle were animated by that generous impulse to refrain from an indiscriminate extermination, possibly with some premonition of the fatal vagaries of the weather. Should there be no recurrence of similar weather with its sleet and snow, there will remain enough birds to supply a demand for sport in the future.

An incident that occurred immediately after the disappearance of the snow shows the result of the severity of the weather. When the hunters with bird dogs and gun discovered a covey that was comparatively reduced in numbers, the birds at first flew, but afterward their wings refused to respond to the effort at flying, and some were captured with the hand, the captives being afterward liberated. They were in that impoverished condition so typical of the birds generally. In this latitude during a deep snow many are inclined to devote time in hunting rabbits, omitting the dogs, when the snow is unusually deep. If they do not find the rabbit in the snow they pursue him by his tracks to some refuge in a hollow log, hollow tree or "sink hole" in the earth, but after the late "crisis" in the weather, dead rabbits were sometimes found occupying their beds. Yet those hunting them found them very numerous, but correspondingly poor, although shrubbery, the sprouts of the sassafras, sumac, honey locust and exposed small fruit trees bore witness to extensive ravages committed by rabbits.

Numbers of jaybirds, woodpeckers, yellow hammers and other feathering denizens of the woods did not endure this extreme condition of the weather, and now compose some of the debris accumulated beneath forest trees. Many field larks that had selected sequestered recesses as protection from wintry blasts became victims, and these birds are now seen in diminished flocks; the smaller birds, whose daily activities are confined to some secluded haunt in the grass, died in great numbers; while some doves did not possess that power of resistance to prolong life against the chilly rigors incidental to a month of February that will long remain as an episode in the history of the weather of this country.

W. L. D.

LENOW, Shelby County, Tenn., Feb. 27.

MR. GEORGE DOBBIN PENNIMAN, president of the Maryland Game and Fish Protective Association, returned yesterday from a gunning trip to North Carolina. Mr. Penniman spent Saturday in the country in southern Maryland. With reference to the partridges in North Carolina, Mr. Penniman said the recent blizzard was not of itself severe enough that far South to kill many birds, but that while the snow was on the ground colored people and others slaughtered the defenseless birds by thousands. In some places the birds could be killed with sticks, and they were easily trapped or shot. Rabbits suffered likewise, and at one small town below Charlotte, N. C., where Mr. Penniman stayed, 2,100 lbs. of rabbits were brought in from the country and sold in one day.

Mr. Penniman said also that down near Wilmington the freezing of the swamps drove the woodcock to the waters nearer the ocean, and that 500 were killed in one day on one stretch of water near Wilmington. The partridges were rather scarce and quite thin, Mr. Penniman found, near Charlotte, where he was shooting. He said that further north in Virginia and Maryland he found that the birds had perished in great numbers, because of the cold and snow.

Reports come to Mr. Penniman from the country district in this State that numbers of dead birds are being found. He will issue a circular in a few days to the game wardens of the State, asking every one to report upon the mortality among the birds in his neighborhood. When the game association gets some approximate idea of what the mortality has been, steps will be taken to remedy the loss of the birds as far as possible, by restocking the district best adapted to their propagation.—Baltimore Sun, Feb. 21.

MARCH 1.—Our big snow (13in. deep) and big freeze with minimum temperature to 3 degrees, which occurred here in the middle of February has nearly cleaned out our local birds. Where the premises are usually vocal with song at this season, I have heard but one solitary wren since the weather broke. Such warblers and other birds as did not freeze and starve were mercilessly shot by hundreds as they shivered and tried to forage on the buried seeds and capsules which were shaken off by the winds and snowed under. I never saw such unconscionable slaughter by men who call themselves sportsmen, as here last month. It was enough to break one's heart to see the strings of larks and robins and bunches of quail which hung in every stall and market. The quail, or partridge, as they are called here, were tough and

tasteless, and when they were set before me for meat my stomach gorged and revolted. Unless accessions arrive from elsewhere this spring our fields and forests will be tenantless.

C. HALLOCK.

ROCKINGHAM, N. C.—*Editor Forest and Stream:* Sportsmen all over the South no doubt would be glad to hear from each other concerning the prospect of quail for next season. I am proud to say the quail in this county is doing well and safe. There are plenty to train on and to shoot. Will be plentiful next season. Two weeks ago in one day I found twenty-three coveys with four dogs, Glad S., Effie T., Jock and Hanover. I bagged forty-nine; could have gotten more, but thought I had enough. Would be glad to hear through FOREST AND STREAM from my friend, Charles Tucker, of Tennessee, and C. E. Buckle, of Virginia, concerning the quail in their State. I trust they have stood the severe weather we have just passed through. Snow was from 8 to 10 in. here.

WALTER L. STEELE.

Newfoundland Caribou.

THE following item taken from the St. John's Evening Herald, of Feb. 7, will give American sportsmen an idea how plentiful are caribou in the Island, and how they are being slaughtered:

"Thursday the Virginian Lake steamed up to the famous hunting ground of the western shore—White Bear Bay—to find 450 carcasses of venison awaiting shipment. The intense frost was such that the place was solid everywhere, and the ship could not get within five miles of the point reached last year. Thousands of caribou are reported on the hills, and even out to the very bottom of the bay they were never known to be so plentiful. Although the thermometer was 5 degrees below zero, it was a gala day for the hunters; dogs drew the carcasses over the ice to the ship's sides, assisted by the men, who came seven miles with each load, and kept up the work until all were at the gangway. They had ears, nose, cheeks and feet frost-bitten, yet did not seem to mind such trifles while at work. The steamer brought from Pushthrough and other ports 200 carcasses of caribou, making in all 650, with more to follow next trip."

Just a fortnight ago the same steamer brought 120 carcasses of venison. This slaughter has been going on for years, and still there does not appear to be any perceptible diminution in the herds of caribou that roam through the vast deer parks of the interior of the island. But of course this state of things cannot last much longer, as it would be an impossibility for the deer to stand such wholesale slaughter. Our local game protection society is taking steps to stop the abuse, and probably at the next session of the Legislature some protective legislation will be enacted. The meat is sold in St. John's for a few cents a pound, and the poorest mechanic can procure cheaply as good a haunch of venison as was ever enjoyed by Friar Tuck and Robin Hood and their jolly men in the classic glades of the New Forest.

W. J. CARROLL.

A meeting of the committee of this society was held last week in the office of the secretary, Mr. Charles H. Emerson, at which every member of the committee was present. At 7:30 P. M. Mr. R. L. Mare, the president, took the chair and a lengthy and important discussion took place with regard to the slaughter of deer, and what means should be adopted to prevent the same. A sub-committee consisting of the chairman, Mr. Mare, Mr. McNeilly, Q. C.; Messrs. F. J. Morris, Mr. Emerson and C. O'N. Conroy, was appointed to draw up a petition to the Legislature on the subject—also with regard to the alteration of the time now allowed for shooting snipe, wild duck, etc., and for a reduction of the present license fee for a non-resident \$100 to \$50. The meeting was an enthusiastic one, and the society is determined to do everything in its power to benefit all sportsmen and settlers.

Maine Legislation.

Boston, March 3.—The commissioners' fish and game bill has been prepared and introduced in the Maine Legislature, and received the sanction of the Committee on Fisheries and Game. It is reported that the Maine Fish and Game Association has had much to do with this bill, which proposes to put under one head all the fish and game laws of the State. The matter introduced makes a pamphlet of forty-one pages, and brings under one chapter of the revised statutes every law, public, private or special, relating to inland fisheries and game, and all laws not therein contained are repealed by the repealing clause of the bill. Not a great many changes are made in the existing laws. Section 5 contains all the laws pertaining to fish. The close time begins October 1, as now, but ends with the leaving of the ice from the lakes and ponds, instead of May 1, as in the old law. No other important changes have been made, except to reduce the number of pounds of trout or landlocked salmon one may take and have in possession to 20, instead of 25, as in the present law. All the lakes and ponds in Somerset and Kennebec counties are closed to all ice fishing, in addition to those in Oxford and Franklin counties, which were closed by the old law. Section 10 adds cusk, suckers and pickerel to the present list of protected fish. In section 11 the sale of ruffed grouse is prohibited and the number one may kill in a day is reduced to fifteen. Sandpipers are also added to the list of protected birds. Section 19 makes the annual close time on deer to commence Dec. 15, instead of Jan. 1, as in the old law. It also puts a close time of six years on caribou. Section 20 changes the penalty for illegal moose killing to fine or imprisonment, or both, at the discretion of the court. Section 21 is new and is really the section that will cause a hard fight when the bill comes up for consideration March 15, the day assigned for it. It proposes that one deer may be killed in September for food, to be consumed in the locality where taken, and by the person taking it, by paying a fee of \$6 for a non-resident of the State and \$4 for a resident, under such rules and regulations as the commissioners

shall establish. This proposed law applies only to counties where there is an open season on deer, and not to those closed all the year. Section 26 is new and provides that two game birds, 10lbs. of fish, a moose or a deer, may be shipped to the home of the lucky sportsman, without his accompanying it, by paying a fee for the privilege; the fee to be large enough to prevent shipping to markets. No changes are made in the guide registration law, except that guides may register as general or local guides. Section 29 is for the purpose of putting sporting camps more completely under the knowledge of the commissioners; that they may know who owns and operates them, and for what purposes.

A long petition has been received, signed by the principal timber and wild land owners of the State, setting forth their great value, and extreme danger from forest fires. They claim that they are entitled to some protection from the dangers of fire, set by the thousands of hunters who roam without restraint over their lands. The petition winds up with this clause: "No protection can be afforded so cheaply and efficiently as to compel hunters and fishermen, intending to camp and kindle fires, to be accompanied by a registered guide, upon whom rests the responsibilities of his office." The petition also claims that much the same argument pertains to sporting camps; that they should be licensed; that their owners should be known to the commissioners to be careful, competent and safe men, to be intrusted with the keeping of the fish and game interests of the State as well as the landed interests of her citizens. How much of the petition will be incorporated in the general fish and game bill it is not yet certain.

SPECIAL.

CHICAGO AND THE WEST.

Ducks Coming North.

CHICAGO, Ill., March 4.—The cold snap here has been broken by a series of rains, which will be very apt to loosen the streams, and make holes in the ice big enough for a duck to get his feet into. Already the flight is well over the lower part of this State, and a few birds have been killed at Water Valley, although the ice is still 18 in. thick. There might be heavy shooting at Swan Lake almost any day now. At Browning, Ill., there is a great mallard country, and a good many mallards are reported feeding on the cornfields near there already. If one cares to go spring shooting, it might be well to keep an eye on Browning this coming week, for a warm spell will bring the ducks up in a great wave over this country. The flight will probably last for a couple of days, and those lucky enough to be on the grounds when it comes will get the shooting.

They tell me that sometimes very good shooting is had at the junction of the Kankakee and Desplaines rivers, near Lorenzo, on the Santa Fe Railroad. A party near here has a flock of seventeen tame decoys, which are said to do their work remarkably well.

By the way, it is at Browning that this art of using tame decoys has reached its highest development. That great duck country had produced some magnificent market-shooters, and it is among these that we find the tame decoy in its most practical form. The bird used is hardly to be distinguished from the mallard duck, excepting that its legs are a little heavier. A flock of about a dozen is ordinarily used, the hens being anchored, perhaps a dozen of them, while four or five drakes are left to feed and swim around. These perfidious fowls call so seductively that they allure the most suspicious wild bird. The shooters in that region ordinarily use the pump gun, and deliver the first barrel just at the time when the wild birds are letting down their legs, 4 or 5 ft. above the heads of the tame decoys. They ordinarily deliver all the shots of the pump gun before the flock has gotten out of range. If you want to see scientific duck shooting go to this Illinois river country. It was Browning that produced Billy Griggs, whom I take to be the king of the market-hunters of all America.

What's the Matter with Illinois?

Mr. R. R. Wiley, of Peoria, Ill., writes to me a letter which sets forth so clearly the real state of affairs in Illinois on game protection, that I am disposed to let him speak in full to the readers of FOREST AND STREAM. He says:

"Allow me to bear testimony to the fine qualities of FOREST AND STREAM, and especially to your department, which has always had an abundance of interest to the hunter or fisherman.

"But the items which have always first engaged my attention are those relating to game protection. It makes my heart glad when you tell of any step forward that is being made by our game wardens or by the Legislature.

"On the Illinois River, near my home, there are several sloughs that were once famous for waterfowl. During migration the ducks were very numerous, but now, as one paddles through these places, with the pleasure of seeing only a few grebes or a band of nervous coots huddled together, one feels as if he were looking at a picture all blue and gray, and no sunshine. We all know, or should know, what has become of the ducks; but let us cease talking and do something. No law ever was or ever will be effective without strong public sentiment behind it. Our legislators need more of this sentiment, and I wish that your paper might be the means of bringing out the expressions of the multitude of our true sportsmen until everybody would wake up to the fact that game protection is vitally necessary.

"To judge from my experiences, in this section of the country, our game and fish laws would have had just as much respect if they had been framed in Greenland. Game is sold and killed in open violation of the law, and market fishermen have seines running out from every point on the river, as long as the water remains open. A gentleman in this city has become interested in these matters, and has sought far and wide for a case where money has been received for school funds due to the conviction of fish law violators. After a great deal of correspondence with many school superintendents in this section, he has found that, with one exception, no money has been received.

"Now, isn't this lamentable? Wouldn't the people be quick to raise a row if their sheriffs or constables allowed a pickpocket or other criminal to victimize them? Are we not being victimized every day of every year in regard to the game and fish laws?

"Let us try to redeem the mistake of the past; shake the lethargy of the public, and make them see the necessity of preserving our birds and fish.

"I have written this much at length to you because you are trying to wake people up to these matters. I hope you will continue, and take as the text for many a sermon 'The Prohibition of Spring Shooting.' When one considers the thousands of gunners, who each spring kill more thousands of female ducks, and when one considers that these thousands would otherwise come back in the fall, multiplied, at the very least, six times, the proposition assumes a very promising aspect.

"I wonder if, among the great many readers of FOREST AND STREAM in this and neighboring States, there are not others who feel as I do about these matters, but who never express themselves?"

There is but too much truth in Mr. Wiley's comment on the weakness of Illinois sentiment in game protection. Something of this is geographical, and much of it is due to heredity. Let us suppose that we are just coming in to the State of Illinois in the early days. We are poor, and want to make a living in the easiest way possible. We find the great Illinois River, running north and south across the State for so great a distance, teeming with fish and crossing a country alive with game. We settle on this strip of country, and we send for our friends. We look upon this stream, with its fish and game, as ours by right of discovery. We don't always go to school, and we don't always read the papers for a generation or so, so we cling to the ways of the past. Our children grow up in the same way. They and their neighbors take up the land back from the stream, owning it for 50 or 100 miles on each side of the waterway, yet not getting so far away as to be out of the reach of its traditions. All these people feel that they own the fish and game, as their fathers did, whenever they see fit to kill it. The free spirit of old America dictates this feeling, and I confess I admire it. I never liked law or restraint myself, and I would like to move to-morrow to a country where such things were not known. But since we are in this country, and since the conditions of this country have changed, and since some of us have learned to think and reason, it is easily to be seen that we cannot have our individual ways any more than we can have the old conditions.

The great thing for the so-called lawless element of lower Illinois to remember, is the thing which they have not learned, and seem unable to learn, namely, that the times have changed. We cannot shoot as we did fifty years ago, for the reason that there are more men and fewer birds. It is just as good sense to spare our ducks as it is to spare our setting hens. We will always have poultry, yet when the first domestic fowls came into Illinois there were a million ducks to where there was one hen. To-day there are a million hens to where there is one duck. The situation is reversed. Why?

All these people of lower Illinois believe in spring shooting. The descendants of the early settlers believe in it, and a great many of the leading citizens of the larger towns believe in it. A good many men in Chicago believe in it. A great many men who profess not to believe it in, none the less practice it. It is no use saying that none of these men are sportsmen, and it is no use reviling them. I am inclined to think that a good deal of the bitter sentiment of lower Illinois against upper Illinois on this very head arose out of the ill-advised position taken by the too ardent wellwishers of good protection. The idea grew up in lower Illinois that the city shooters wanted to force upon the statutes laws which suited them, laws which were good for sportsmen, but which were not enacted for the benefit of the people. This sort of thing was at once met by the stubborn old idea of American independence, the rebellion against class legislation. This is why we do not have popular sentiment behind our game laws. The sportsmen of Chicago have tried to cram the prohibition of spring shooting down the neck of lower Illinois, and the latter wouldn't have it so. We never will stop this spring shooting in Illinois so long as the old situation remains unchanged. To me the natural method seems to be that of putting before all the people of this State, north and south, the simple proposition that we are men and brothers, and that a sportsman is no whit better than any other man. Before all of these men, sportsmen so-called, or plain citizens, there can always be gently put the homely parallel of the hen and the duck, and their positions now so lamentably reversed. If I wanted to pass a law stopping spring shooting in Illinois, I should spend some money in the lower portion of the State in a mild effort to show these high spirited Americans, who are just as good as any of us who live in the city, that the times are no longer as they were, so that we can no longer act as once we did. If we stop spring shooting in Illinois we will have fall shooting again. The question for all of us is, Would it not be better to have fall shooting for twenty years than spring shooting for ten years? I should fancy that the matter would resolve itself into some such proposition as the latter.

Wants a Hudson Bay Knife.

Mr. A. C. Stott, of Stottville, N. Y., writes me asking where he can get the Hudson Bay knife, described by Mr. MacGowan, of St. Paul. The Hudson Bay Company, of Winnipeg, Man., can supply it. I do not know what the import charges will be. Mr. Stott will see more about this in earlier numbers of the FOREST AND STREAM.

Personal.

During the past winter Mr. Coleman, president of the Austin Powder Company, Cleveland, O., was taken very seriously ill, and for a long time had a hard fight for recovery. So able and pleasant a gentleman can ill be spared even temporarily from business walks, and I am very glad to hear from A. Lent, treasurer of the Austin Powder Company, that Mr. Coleman though still confined to his house, is rapidly improving. His illness was a severe one, and brought him near death's door. Mr. Lent says, "Traveling the downward path occupied months, and full recovery will of necessity consume time. As the boys remark, he is a 'comer,' and we expect to see

him here at the office not later than May 1." Even this delayed date will enable Mr. Coleman to take a hand in the trade of the coming year, which bids fair to be one unprecedentedly large.

Mr. E. D. Updike, a prominent Board of Trade man, of Chicago, left this week for San Antonio and the Texas coast. I regret that I did not meet him to add my mite to his information regarding the Southwest country, but if he once gets there he cannot help having a good time.

E. HOUGH.

1200 BOYCE BUILDING, Chicago, Ill.

Deer in Town.

GLOVERSVILLE, N. Y., March 1.—*Editor Forest and Stream:* Kingsboro is a suburb of Gloversville. Every year deer come from the mountain, three miles north of our city, and are seen by the inhabitants. The Leader reported the other day:

"The residents of Kingsboro and Marshall avenues and adjoining streets were considerably surprised yesterday morning by the appearance of a young deer strolling along the thoroughfares. The deer did not seem to be worried by the environments of civilization, and after spending some time about the portion of the city mentioned, the deer crossed East Fulton street, jumped a fence about the cemetery, and while it was standing on top of one of the vaults it was noticed by several persons. No attempt was made to capture the animal, although a number of boys who saw it on one of the streets gave chase, but were easily distanced. After remaining in the cemetery a short time the deer went toward the southeastern part of the city and disappeared in the woods near Cold Spring."

J. H. D.

GLOVERSVILLE, March 4.—Here is a sequel to the note sent you a few days ago: "Residents of the city who arose at an early hour this morning had the pleasure of witnessing the decidedly unusual sight of a wild deer running about the streets in the business portion of the city. The creature was a doe, evidently quite young, and was not very large. It was first seen on Kingsboro avenue by two hounds, which immediately gave chase, and pursued the deer over the avenue and down Prospect street, until they attracted the attention of Druggist Robert Baird, who was walking down town. He very promptly stopped the dogs and prevented further trouble to the deer from that source, but the little creature continued its flight toward the center of the city, and finally entered the Keystone Hotel barn on South Main street in a very exhausted condition. This morning James Kathan, who has charge of the barn, went to Johnstown and found Game Protector Leavitt absent from home. The possession of the deer was reported to his family with a request to notify the protector as soon as possible. An effort was also made to notify Game Protector Lobdell, of Northville, but it was reported that he was ill and could not be seen. As a result, the deer will be kept in the barn and cared for until Game Protector Leavitt determines what is to be done with it."

Maine Venison Shipments.

BOSTON, March 6.—I met a Boston sportsman on the street Saturday, who was much pleased over a bit of information he had received from Maine. The same story he also told me had been telegraphed to the Boston papers. It concerned a lighter which came ashore at a well-known Maine port, where shipping to Boston is easy. On board the lighter was a number of barrels. These a game warden happened to spy, and became suspicious of them. He detained the captain of the lighter and opened the barrels. In them he found the saddles and hides of seventeen deer, each one tagged to a Boston firm. He seized the venison and put the captain of the lighter under arrest. The fine will be \$40 for having each deer in possession, besides attempting to ship them out of the State. I hope that this story of arrest is true, for I have seen eleven more saddles of deer, just received at a Boston commission house, since last writing the FOREST AND STREAM. If it is true, one of the outlets of the underground railway for shipping deer out of Maine in close season may be stopped at last.

The ideas of the ordinary New York press reporter are crude, if not laughable. I was shown a clipping yesterday from a city paper, which went on to give an item of news concerning one of the live moose now in the Madison Square Garden sportsmen's show. It told of the ugly nature of the moose and of his attack on the men who helped put him on the train at Lewiston, Me., "where he was trapped." Well, the citizens of the city of Lewiston will smile when they read of trapping wild and savage moose within their borders. The truth of the matter is that the moose comes from a game park in that city, and that he was taken up and haltered in the yard and led to the car that was to take him to New York. He went into the car rather unwillingly, but there was about as much trouble about it as there would have been concerning a balky horse under like circumstances.

Later: It comes from perfectly reliable sources that a seizure of seventeen deer saddles was made on Thursday last; the game en route for the Boston market.

SPECIAL.

Weight of Quail.

LOCKPORT, N. Y., March 2.—By a sad misfortune of a few sportsmen here, who are trying to restock a portion of the farms near the city with quail for next season's shooting, I am enabled to give Didymus some information as to the weight of Bob White that was supposed to have come from Montana, although the parties received them from a New York dealer, which was a great mistake, as they have no knowledge of how long they had been in confinement.

Of 120 shipped on Feb. 15, eleven were dead when received the next day. The rest were divided into three lots and taken to different farms to be liberated when the weather was favorable. Of one lot of twenty-seven seven died within three days, when the party turned the remainder out of the building where they were confined, and they went directly to a straw stack in the ad-

joining field; since when I have not heard from them, but as there has been no snow on the ground and the weather has been mild and pleasant, I do not doubt that they are doing well. I secured the eighteen dead birds, eleven of which were females, and weighed each bird separately. With the exception of two of the males, I found them in fair condition. The aggregate weight of the seven males was 36oz.; an average of little over 5oz.; the eleven females weighed 61oz., a trifle over 5½oz. each. I should think that these birds when caught would have averaged at least 6oz.; which would be light for Montana birds. I have a female in my collection taken eighteen years ago in this country (Niagara) that weighed 9oz. when I took it from a bunch of birds in the market, where it attracted my attention by its large size and light color, it being much lighter colored than two other females taken here.

J. L. DAWSON.

[The quail of course did not come from Montana, where there are no quail; but were probably from West Virginia, North Carolina, the Indian Territory or Kansas.]

Teton Guide and Game Protective Association

JACKSON, Wyoming, Feb. 28.—*Editor Forest and Stream:* The game is wintering fine, except as to a few calves. The winter has been comparatively open.

An organization was completed here this month, known as the Teton Guide and Game Protective Association. The officers for the first year are as follows: S. N. Leek, President; Webster La Plant, Vice-President; Andy Watson, Treasurer; Wm. Simpson, Secretary and Clerk to Board of Managers.

The objects are to furnish sportsmen with reliable information and the names of competent guides, and to protect them in their hunting rights and privileges in the Jackson Valley country. With a view of making the association a reliable institution, representative residents who are not engaged in guiding tourists, are members.

The past year has indicated that an organization of this kind is a necessity. Several tourists have complained of unfair treatment at the hands of incompetent persons representing themselves as guides.

The changes in the game law made by the present Legislature, are new to most people in the State. As soon as the law is printed and distributed, it will be time to commence their enforcement. As we are not familiar with the features of the law as passed, only in a general way, we will not attempt to criticize or commend them. Suffice to say that the first duty of the State game warden will be to enforce the law in the community where the game ranges.

W. L. SIMPSON.

Maine Deer and Lumbermen.

JACKMAN, Me., March 1.—*Editor Forest and Stream:* In your publication of Feb. 25 you misquote me in your article, "A Maine Winter Robin." What I really wrote was: "There are several large deer yards in the vicinity of camp, and so far they are all doing nicely, and none are being killed by the lumbermen or anyone else." While you quote me as saying, "and were all being killed." Kindly correct this error and greatly oblige

F. W. LAWTON.

The Sportsmen's Exposition.

THE fifth annual exposition of the Sportsmen's Association in the Madison Square Garden, of this city, surpasses all that have gone before it in the provision of attractions strictly within the scope of such an exhibition, and apart from the purely trade displays. The show has been closely modeled on that of Boston last year, with respect to features and their arrangement. The immense floor space of the Garden is almost entirely given up to the attractions. There are a game paddock for live game, an aviary of game birds, an artificial lake for aquatic sports, on the shore of which the Indian tepees are set against a magnificent scene-painting of the great glacier region of the Selkirks.

The paddock is enclosed with Page woven wire fencing, and in it are buffalo, caribou, moose, elk and Virginia deer; while in cages and pens are bears, gray wolves, mountain lions, raccoons, opossums, beavers and game birds. There is a large and admirably arranged aquarium display of fishes by the New York Fisheries, Game and Forest Commission, under the immediate direction of Mr. A. N. Cheney. The fishes shown include a series comprising steelhead, red-throat, rainbow, brown, brook and lake trout, pike, perch, and black bass. Among the trout are mature specimens and yearlings and two-year-olds. There is also a model hatchery.

Among the birds novel to most visitors are two trained falcons, imported from Europe.

Hunters, Trappers and Guides.

Again the sons of Nimrod have gathered from the four winds to the place of meeting, where Diana stretches her golden bow. Under one roof are men who know the hunting countries of the continent. The big game sections of the North are, however, best represented among the hunters, trappers and guides, and particularly the moose countries, from Maine on the east to the Rockies on the west.

The Quebec Exhibit.

Half of the north side of the floor of the Garden is given up to the Quebec exhibit, and the attractions of woods and waters are represented by game animals and birds, some living and some stuffed, placed in front of a cycloramic background, and by hunters who are there to explain about the birds and beasts. The Quebec exhibit is in charge of Mr. L. Z. Joncas, assisted by Mr. N. E. Cormier. Mr. J. W. McNicol has charge of one section, and with him are Alfred Lanoie, George Frazar and Beebe Lirette, who are guides, Messrs. Turcotte and Jackson are also connected with the exhibit.

Mr. W. H. Parker represents the Laurentian Club, of which he is manager. He is accompanied by three noted guides, Bazile Maurice, who was with General Wolseley on the Nile expedition, and Aimé Beaulier and his brother, Narcisse. Mr. Parker organized the Winchester, Shaivinegan, Laurentian and St. Maurice clubs, and

has the further distinction of having been one of the earliest subscribers to FOREST AND STREAM, having sent Charles Hallock a check for \$25 for subscriptions while the first issues were fresh from the press. Mr. Parker's Laurentian guides sing Canadian boat songs, and have voices of wonderful sweetness and power.

Mr. Cormier invited the FOREST AND STREAM man to take a little six weeks' trip next summer up the St. Maurice to the headwaters of its southwest branch, and then downstream either by the Gatineau or Ottawa to civilization. The three streams mentioned take their rise, according to Mr. Cormier, in a pond about the size of the amphitheater of the Madison Square Garden. Mr. Cormier is Superintendent of Fisheries and Game at Avinver, Quebec, and among the many other things he does, he arranges to supply park owners with wild game, from beaver to moose. He could have brought a carload of moose and caribou to the Sportsmen's Exposition if they had been wanted, and he has at the present time several contracts on hand for supplying big game for parks.

The Adirondacks.

The Adirondack exhibit occupies the other half of the space on the north side of the Garden, just east of the Quebec exhibit. There are some neatly finished camps, interesting game trophies, and a still more interesting collection of husky woodsmen. The great hotel keepers are represented, and George Stevens, Jr., who is said by his friends to be one of the best living still-hunters, is there in person. The men connected with this exhibit comprise the finest aggregation of sturdy manhood to be found in the Garden. Among the guides who are particularly worth talking to are Warren W. Cole, of Long Lake; F. C. Chase, Newcomb, and Fayette Moody, Saranac.

The Canadian Pacific.

The Fourth avenue end of the Garden is devoted to a scenic and very successful representation of an Indian hunting camp in the Selkirks. The background is a gigantic painting of the great glacier of the Selkirks, and is a remarkably good representation of the actual landscape. Timbered hills are shown in the middle distance, and the stream which drains the glacier. In front are the tepees of the aborigines, and moving about at their various tasks the Indians themselves. At their feet is the swimming pool, and the canoes are drawn up on the bank.

Mr. L. O. Armstrong, has general supervision of the exhibit, assisted by Mr. C. C. Farr. The canoes shown in the cyclorama setting are of Eastern manufacture, and the majority of the Indians never saw a glacier in their lives, but that doesn't spoil the effect. Nesodaro, the Mountain Cree, is at home in the shadow of the towering Selkirks, but for all practical purposes Willie Paulson, from the Upper Ottawa, fits into the picture and plays his part just as well.

The Quebec & Lake St. John Railway has an interesting exhibit next the C. P. Ry. on the south side of the Garden, and then comes the State of Maine, with a great exhibit, reaching almost to the Madison avenue entrance.

Maine.

The Maine exhibit is divided into different sections. At the west end is the camp of the Megantic Fish and Game Preserve.

In the Patten section is Natey Fogg, equally ready to tell a good story or to post sportsmen on the advantages of the Jack Darling camps, on the Sebois Chain, of which he is the present proprietor. At his elbow is John Jackman, the Patten photographer, some of whose game pictures have been printed in FOREST AND STREAM, and somewhere in the neighborhood may be found W. S. McKinney, who is a very unpopular man with the bears of the Pine Tree State. His brother Frank is the man who killed a moose with a .22cal. pistol and the short cartridge loaded with smokeless powder. Mr. Howe, of Curren & Howe, represents the Trout Brook farm. Moose, deer and caribou are the principal live stock. Some of the deer are so obliging that they walk right up to the door when their turn comes to be shot. Mr. Sumner L. Crosby, the taxidermist, is in evidence, as usual. What Maine would be without Mr. Crosby is not pleasant to think about. Wm. E. Cushman, of Sheoman, has a collection of trophies that would pain a sensitive bear to contemplate. He has a cigar-box full of claws and teeth, and other relics of victims to the steel trap habit. In making this collection, Mr. Cushman is following in his father's footsteps, the only difference being that his father used a set gun.

Capt. Barker, of course, is here, and if he had time between greeting old friends and answering questions about Maine hunting resorts, he could give some interesting observations on his recent trip to Santiago and other war points.

A University Course in Woodcraft.

If anybody has any puzzling questions to ask about any subject of simon-pure woodcraft or natural history from the hunter's and trapper's standpoint, which treats of the science from the point where man and beast rub shoulders, he will find some professors here ready to elucidate the matter for him. These professors know little of kid glove methods of imparting knowledge. Some of them handle their grammar after trade-marked fashion of their own that defies parsing and the commonly accepted rules of construction, and which would be as much of a puzzle to the New England college professor as was Scotty Briggs' chewing of the language to the reverend gospel sharp. Yet there is a force and directness about what they say that carries conviction, and when it comes to driving home an argument and clinching it on the other side for keeps with the fewest possible words, the college professor has to give way to the woodsman.

Many of these wilderness-rover professors supplement spoken language with sign language. Cut off the courier des bois' hands and he cannot talk, and for a similar reason, if Nesodaro, the Mountain Cree, were to be fastened to his chair, he could never properly make you see the final short-range struggle with the grizzly.

Nesodaro's Bear Story.

Mr. L. O. Armstrong introduced Nesodaro. Mr. Armstrong said Nesodaro has given it as his impression of New York city (and there are those who agree with him) that the tepees are too high and the people too many.

Nesodaro hails from the Stoney Indian Reserve, in western Alberta, and his hunting grounds are the world's white roof-tree, north, west and south of Banff along the backbone of the Rockies. Mr. Armstrong opened a map to point out to the Indian his home. He ran his finger along the line of the railroad till he came to Morley, and then north to the Bow River. "There you are, Nesodaro," he said. "You live on this stream emptying into the Bow-What's-Its-Name, Ghost River?"

"Oh, yes," said Nesodaro, pleased to hear the name. "Me come down that mountain," and he placed his dusky forefinger on a nearby elevation shown on the map.

"That's Minnewaukan," said Mr. Armstrong, and again Nesodaro's face lit up and he said:

"Oh, yes, me come down there."

"Now," said the agent, "you're no more a lost child. You know where you live, though I doubt if you'd ever get back there unless we took you. It's a good many moons' travel on foot."

I asked Nesodaro how many cubs he had ever seen with an old bear. He mistook my question and answered "Fifteen," and the crowd of ignorant city people who had jammed into the tepee laughed. Nesodaro laughed himself, good-naturedly, and turning to a little boy who was struggling in his father's arms much as if he expected to be thrown to a wild beast to be devoured, reached out his hand and stroked him, whereat Young America gave such a start that, as Fred Moody expressed it once, he had to jump backwards to get into his skin again.

I explained my meaning and Nesodaro said:

"Some bear, three; some bear, two; no see four."

A White Bear and Black Sheep.

Nesodaro says caribou and moose are pretty scarce in his hunting grounds. He has killed six of the former and ten of the latter animals. Elk are fairly numerous, while mountain sheep and goats are "too many."

There are two kinds of sheep, according to his statement, the black sheep and the white sheep. He pointed to some brownish martin fur trimming on his clothing to show the color of the black sheep, and to his smoke-tanned buckskin blouse to show the color of the other, which was evidently the well-known bighorn. He says the black sheep are found "west Red Deer River, west Saskat'wan, west Old Man River."

It seems just possible that the black sheep referred to may be the *Ovis stoni*, and if so the fact is of great interest, as indicating a southern range of this sheep on the eastern flank of the Rockies considerably below the supposed limit.

Nesodaro says he has killed a white bear. It was a small animal, and though weighing only about 200lbs. it was very fat. He killed it in the "low winter" and sold the hide for \$11. It had eyes "black as hair."

The Birch Bark Tepee.

Mr. C. C. Farr, who was with the Hudson Bay Company fifteen years, and who has been around the headwaters of the Ottawa for a much longer period, is a mine of interesting information on all matter pertaining to game or wild life. He saw me looking at a bark tepee and said that the Indian name for it was asohahgan, and that the specimen came from Lake Animapissing.

"I had to get one of them for the show," he said, "and I went to an Indian named Peeshahbo and told him to give me his. Peeshahbo said: 'How the blazes am I going to live for the rest of the winter?' I said: 'Oh! man, ye'll make a new one.' 'But I can't peel any bark,' says he. 'Never you mind,' says I, 'I've got to have it,' and with that I took it, and here it is."

Mr. Farr explained that the bark tepees are used by the Indians on their winter hunting trips. They are made in summer from the bark of large birches, sewed together in sections measuring about 3 by 12ft. The pole framework of the tepee is erected and the bark bent around before it has dried, so that it will take the proper shape. The free ends of the bark sections are protected and kept from splitting by light strips of wood, one on either side, which are attached by sewing. Seven of these 3x12 bark sections are used in the construction of the asohahgan. When the Indian moves his camp the sections are made into tight rolls, for convenience in carrying. In erecting the tepee the bottom section is put in place first, and two of the rolls are commonly required to reach around. Afterwards the other sections are wound around the cone-shaped framework up to within a short distance of the peak. The top is left open for the escape of smoke. The upper sections lap over the lower, shingle fashion, and all the seams run diagonally with reference to a vertical line, in such a way as to shed water perfectly.

The sewing is done with wattup. Wattup is made from the roots of spruce trees, pulled out by the women and boiled till softened. The brown bark covering is rubbed off and the roots split into suitable sizes for sewing. Wattup will keep for years and is tougher than moosewood. When wanted for use, all that is necessary is to throw it into water, and it becomes pliable and easily worked.

Bark and Wattup.

The Kippawas use birch bark and wattup for all conceivable purposes, from making their canoes to the construction of minnekwanan pots, which are oval-topped affairs finished with rectangular bottoms, and used for holding berries or sewing materials, or even, at times, when pitched along the seams, as water vessels. The French word for minnekwanan is corceau. Willie Paulson has a birch bark bat that is a work of art, both in ensemble and detail.

In constructing their canoes, the Indians use two kinds of bark. The heaviest goes into the bottom and is called bottom bark, and the lighter bark is side bark. As Mr. Farr remarked, "the words carry the significance, do ye

see?" On these northern waters of the Ottawa great canoes, up to 35ft. in length, are still used. The four and a half and five fathom canoes are commoner. The Rob Roy, made by old Amab, chief of the Kippawas, is the king of the lot, with her six fathoms to the wet. The mention of Amab made Mr. Farr reminiscent.

Indian Dress.

"Twenty-six years ago," said he, "I first saw his old wife. She was dressed in tartan plaid, with a belt and tomahawk at her waist, and a beaded hood on her head. On her legs she wore metasse, or leggings. Before the Indians came in contact with the white man they used to wear for their winter dress woven rabbit-skin garments. The clothing was made on the same principle as the rabbit-skin robes so popular in the Klondike at the present time. The Indians of the Temiscamingue and Temaganis region cut rabbit skins into strips and twist them, and then net them together exactly as they make a fish net. With a dirty blanket underneath and a rabbit-skin robe on top they will sleep out in the open very comfortably with the thermometer 40 degrees below zero. The Indian name for the robe is assaybeekwan, meaning a netted covering."

From Caribou to Clothing in Quick Time.

While we were talking Paulson passed again, and Mr. Farr called attention to his buckskin suit. "That skin was a live caribou two weeks ago," he remarked.

"You know, the Indians don't wear those things back in the woods. But I had to rig 'em out in fancy style for this show, so I told Willie to get some buckskin clothes, and he went out and killed two caribou and had their hides nicely smoke-tanned and made into coat and pants in short order. Every man can be his own tailor in that country, if he has a good squaw to do the work."

Live Wild Birds.

Prominent among the live creatures to be seen at the Garden, and attracting much attention from visitors, are a number of cages containing wild birds, among which may be mentioned quail, pheasants and several species of wildfowl. The cages are noticeable for being well built and commodious, much better suited for the exhibition of these birds than anything previously seen at such shows. Each one is provided with a water tank sufficiently ample to allow the birds to swim and bathe. Among the wildfowl are black and white domesticated swans, Canada geese and snow geese, European sheldrake and widgeons, mallards, teal, and a cage of beautiful wood ducks and mandarin ducks.

It is to be noticed that in this exhibit the foreign species are almost as numerous as are the native ones. The birds all seem in excellent condition and are, of course, greatly admired by all visitors.

It is to be regretted that neither Mr. Wilton Lockwood, of Boston, nor Mr. Timothy Treadwell, of Long Island, should have sent cages of their birds to this show. Their collections, as seen at other shows, are remarkably full and very interesting. It certainly seems as if it would be worth while for more people to pay attention to this question of domesticating wildfowl. When we recall the fact that persons enthusiastic in matters of this sort have succeeded in getting certain wild grouse, wild ducks and wild geese to breed regularly in confinement, it would appear as if only time, study and care were required to induce certain sorts of wildfowl to breed in confinement as freely as do our domestic species.

Trade Exhibits.

E. I. DU PONT DE NEMOURS & CO.

Stand 49 contains the exhibit of the firm of E. I. Du Pont De Nemours & Co., Wilmington, Del. It is situated in the gallery to the left of the Madison avenue entrance. It contains a very complete display of the different kinds of powders manufactured by the company, sporting, military and blasting, together with samples of the crude materials from which the black powders are manufactured. All are most attractively arranged and exhibited. Powder kegs in variety of size and color display the manner of identification and shipment. There are also samples of smokeless powder for shotgun and rifles and cannon powder. A most interesting part of the exhibit is the model of a cannon charge for the 13in. guns used in the navy. Standing on end, the powder charge measures 634ft., the projectile 334ft. more. The charge of powder weighs 210lbs. and the projectile 1,100lbs. Mr. Pierre Gentieu is in charge.

HAZARD POWDER CO.

Stand 51 contains the exhibit of the Hazard Powder Co., 44 Cedar street, New York. In the exhibit are samples of all kinds of powder manufactured by this company, with also samples of the crude material from which the black powders are made. There is also a sample of the company's Blue Ribbon shotgun powder. Mr. B. H. Norton is in charge. The exhibit is most attractively arranged.

LAFLIN & RAND POWDER CO.

Stands Nos. 52, 53 and 54 are occupied by the Laflin & Rand Powder Co., 99 Cedar street, New York. It catches the eye from any part of the Garden, the large models of the 12, 10 and 8in. breech-loading cannon being full size and very conspicuous. These are sectional models, about 16ft. long, and show the monster guns split lengthwise. The bore, breech-loading mechanism, etc., are made apparent to the eye at a glance. The full size dummy projectiles rest in the bores, with their respective dummy loads of 250, 140 and 75lbs. of powder placed in the chambers in proper manner. Several targets made by Mr. W. M. Thomas, with the Laflin & Rand smokeless powders, testify to their worth and to the skill of the riflemen who could perform so well at 500yds. Samples of their new sporting rifle smokeless, for rifles and pistols built for the use of black powders are also a part of the company's exhibit. Mr. Ed. Taylor, wise in the lore of what powders are made of and what they will do when made, is in charge.

UNION METALLIC CARTRIDGE CO.

The Union Metallic Cartridge Co., Bridgeport, Conn., occupy spaces from No. 55 to 59. Their exhibit is apparent from any part of the Garden, for its size and simple, yet rich, elegance. It is in the form of a lone arch, made of mahogany, the pillars of which are shelved and walled with clear glass, so that all the varieties of rifle cartridges, sporting and military, are readily seen by the eye at a glance. There are all calibers, with all kinds of powder charges and all kinds of bullets. The ammunition for machine and rapid-fire guns is also in evidence. There are glittering primers by the bushel, and wads, shells and shotgun ammunition in general of all sizes, the 28 and 24gauge nitro shells being a special novelty. Mr. W. M. (U. M. C.) Thomas and Mr. J. J. (U. M. C.) Hallowell are in charge.

LEROY SHOT AND LEAD WORKS.

The Leroy Shot and Lead Works, 261 Water street, New York, occupy Stand No. 60. There are displayed samples of all kinds and sizes of shot, most artistically arranged. There are sizes from the robust bullet down to the fine sizes of shot used by bird collectors and naturalists.

SHOVERLING, DALY & GALES.

Messrs. Shoverling, Daly & Gales, of 325 Broadway, New York, have a very attractive display of sportsmen's goods, the main features of which are the Daly guns, many of which are highly and richly finished, and a quite full line of the celebrated Marlin rifles and shotguns and Bristol steel rods, fishing tackle and golf goods. The Borchardt pistol-carbine is a very interesting part of their exhibit. Mr. G. R. Schneider is in charge.

BRIDGEPORT GUN IMPLEMENT CO.

The Bridgeport Gun Implement Co., Bridgeport, Conn., occupy Stands Nos. 64 and 65. Their exhibit is confined to golf implements and loading blocks for shotgun ammunition. Their space is neat and attractive. Mr. A. L. Taylor is in charge.

THE INTERSTATE ASSOCIATION.

Stand No. 72 is where the Interstate Association is in evidence. Mr. Elmer E. Shaner, the able manager, occupies and transacts business in it in his leisure moments.

THE U. S. CARTRIDGE CO.

The U. S. Cartridge Co., of Lowell, Mass., occupy stands Nos. 73 and 74. It is most attractively furnished in Oriental style, carpets, divans and comfortable chairs making up the furnishing. It is in one of the choice parts of the Garden, commanding a view of everything worth seeing, and is presided over by Mr. C. W. Dimmick.

PETERS CARTRIDGE CO. AND KING POWDER CO.

The Peters Cartridge Co. and the King Powder Co., of Cincinnati, O., have stand No. 75. It is neatly furnished, more with a view to receiving and entertaining the many friends of the company than with a view to displaying the company's wares. There are visitors therein constantly. Mr. T. H. Keller is the gentleman in charge.

PANTASOTE CO.

In stands Nos. 76 and 77 the Pantasote Co., of 29 Broadway, New York, holds forth. Their specialty is a tough, water-proof cloth, resembling leather in the quality of its toughness, which is manufactured into shooting suits, tents and camping outfits, sailors' wear, etc. Mr. W. L. Bratton is in charge.

SAVAGE ARMS CO.

The Savage Arms Co. occupy stand No. 79. It contains a complete display of the Savage military and sporting rifles. An iron plate, bearing the profile of an Indian, the outline of which was punched with soft-nosed bullets, which pierced the 5-16in. plate as if it were made of cheese, bears testimony to the accuracy of the rifle and the skill of Mr. A. Savage, the inventor of it and the marksman who made the wonderful target. Mr. H. S. Wells is in charge.

TATHAM BROTHERS.

Stand No. 82 is occupied by Tatham Brothers, of 82 Beekman street, New York. Their exhibit contains a full line of drop and chilled shot, numbering from 24 to the ounce to 162, 304 to the same weight. The whole is displayed in elaborate variety. Mr. F. M. Foye is in charge.

PARKER BROTHERS.

Parker Brothers, of Meriden, Conn., in stand No. 83, display a full line of the shotguns which they manufacture, from the \$50 grade up to the highest priced ones, gems of finish and elegance. Mr. L. Parker and Mr. J. R. Hull are in charge.

THE CLEVELAND TARGET CO.

The Cleveland Target Co., Cleveland, O., display a magautrap in stand No. 84. Its workings are patiently and intelligently illustrated by Mr. Charles A. North, a brother of Mr. Paul North.

VON LENDERKE & DETMOLD.

Messrs. Von Lenderke & Detmold, 318 Broadway, New York, display an elaborate variety of Francotte guns, Mauser self-loading pistols, Stevens rifles and pistols, and Wuesther dry plates and photographs made with the plates. Also they exhibit a full line of fishing tackle, the special pride of John Wright. Mr. Gus Grieff is in charge most of the time, though Mr. Justus Von Lenderke gives the exhibit much personal attention. Their space is always crowded with visitors.

The E. C. and Schultze powders, of course, constitute a prominent feature of the exhibit.

REMINGTON ARMS CO.

The Remington Arms Co., 315 Broadway, New York,

display a full line of their famous sporting and military rifles in stands Nos. 87 and 88. There are pretty, low-priced specimens, and again there are specimens of the finest finish, which are higher priced, but gems of utility and art. The 16-gauge hammerless, the elegantly finished target rifles, and the auxiliary rifle barrels are all arms which will invite the attention of the sportsmen. Mr. W. F. Haight is in charge.

GUN BORE TREATMENT CO.

The Gun Bore Treatment Co., of 7 Warren street, New York, occupy stand No. 93. They exhibit many samples of the value of their art, as shown by barrels which have been treated in comparison with barrels which have not. Mr. Edward A. Rice, assisted by Mr. Neaf Apgar, is in charge.

G. W. COLE & CO.

In stand No. 90 Messrs. G. W. Cole & Co. display their well-known lubricant and rust preventive, 3 in 1, esteemed and used by bicyclists, owners of guns, rifles, etc.

PAGE WOVEN WIRE FENCE CO.

The Page Woven Wire Fence Co., of Adrian, Mich., occupy stand No. 91. Models and pictures illustrating the utility and neatness of the fence in actual use are on exhibition, and the merits of their product are ably explained by Mr. W. A. Hoisington.

THE MARINE EXHIBITS.

The nautical part of the show is so meager as to warrant the supposition that the management does not consider yachting, canoeing and rowing as representative American sports worthy of recognition on an equal footing with field sports. There are no exhibits of yachts or yacht models, no rowing boats, and no canoes except one of the Maine wood and canvas canoes used by the Indians in their camp, and in the tank. Some rolls of birch bark have been provided from which the Indians will make a canoe in view of the spectators, an operation which should be extremely interesting. At the present time, when there is such a lively interest in yachting, a good collection of designers' and builders' models would prove a great attraction, but thus far nothing of the kind has been attempted at any of the shows.

The one exhibit which appeals in any way to yachtsmen is that of gasoline boats and motors. This exhibit, it may be said, is purely an engineering one; where the hulls are shown, either by models or in the actual craft, they are with a few exceptions notably bad. As a class, they show no evidences of skillful and deliberate design, but rather of being whittled out at odd times by engineers and machinists. It is surprising that as the success of any launch engine depends really on the performance of the boat as a whole, those who build engines pay no attention whatever to the hulls in which they are placed; except as to the amount of brass and mahogany which can be carried without sinking the boat. Those who are interested in the power launch, which is growing in popularity every year, are able to inspect and compare a number of different makes of engines.

The Daimler Manufacturing Company exhibits this year three of its engines, the Daimler Marine Motor. One of these is a double engine of 35 H. P., one of 16 H. P. and one of 4 H. P. A small model of good design shows one of the company's soft cabin yachts, with 16 H. P. motor, the model being complete in all details of cabin, etc.

Several other firms show motors of various descriptions.

TAXIDERMY.

In stand No. 50, on the left of the entrance, Thomas W. Fraine, of Rochester, shows a series of admirably mounted heads of caribou from Newfoundland, mountain sheep and Virginia deer, all most artistically disposed.

In spaces Nos. 68-70, W. W. Hart & Co., of New York, make a display of heads and other trophies. Most interest, naturally, is shown in the large collection of remarkable moose horns from Alaska, some description of which was given in a recent issue of this journal.

Look Out for the Engine.

THE Bangor Daily Commercial reported the other day that one of the trains of the Bangor & Aroostook Railroad had barely escaped running down a bull moose on the track.

On the day following the publication of the story of the bucking moose, General Manager Cram, of the Bangor & Aroostook Railroad, received the following communication from Chairman Carleton, of the Game Commission:

Augusta, Feb. 22.—Hon. F. W. Cram, V. P. and G. M., B. & A. R. R., Bangor, Me.: My dear sir—I inclose herewith clippings from the Bangor Commercial of Feb. 21, which explains itself, also a copy of the law pertaining to the protection of moose.

I regret exceedingly that it becomes my duty to complain against this corporation, which is otherwise so well behaved, for violation of the game laws. It is the opinion of the Commissioners that we cannot permit railroads to go on wounding and maiming and disfiguring moose indiscriminately. It is the opinion of the Commissioners that a general order should be issued by the management of the B. & A. R. R. to your employees, that when they see a big bull moose approaching they should immediately stop the train and let him proceed on his way unmolested and undisturbed.

Before taking further action in this matter, however, we should like to receive your explanation, if you have any, as to why you should not be proceeded against for hunting this moose, as in such case is made and provided by the law of the land.

I have the honor to be, very respectfully yours,

(Signed) L. T. Carleton, Chairman.

Replying to Commissioner Carleton, Mr. Cram wrote as follows: Feb. 23, 1899.—Hon. L. T. Carleton, Chairman Fish and Game Commissioners, Augusta, Me.: My dear sir—Your letter of Feb. 22, with clippings attached, is received. It throws a flood of light upon a very perplexing question. Manifestly those in charge of live stock have no right to willfully or carelessly permit it to run at large in highways or upon the right of way of a railroad company. As an example, and a warning, every offender should, we believe, be brought to book. The difficulty has been to fix responsibility. It is apparent from your communication that you admit the trespassing live stock to be in your charge. We will accordingly ask the Supreme Court to try you out. The proceedings can best be conducted, I am sure, in or near the pasturing grounds. I suggest therefore the top of Mt. Katahdin as the place, and April 1 as the date for the hearing.

If this does not meet with your approval, and you see fit to pay this company \$1,000,000 in settlement for annoyances, so far and give a satisfactory bond to keep your derved critics off the tracks from this forward, we will, with the approval of the petitioners for a 2 cent per mile interchangeable ticket and their counsel, let you off. This proposition without prejudice to the rights of either party, and to remain open just two minutes after you have received it. Yours truly,

(Signed) F. W. Cram, V. P. and Gen'l Manager.

Sea and River Fishing.

Proprietors of fishing and hunting resorts will find it profitable to advertise them in FOREST AND STREAM.

Red Letter Days.

III.—Trout Fishing.

THE man of leisure is a rare bird in this western world, particularly in these days of unrest, when almost everybody has a dozen irons in the fire, a score of jobs on hand, and when of the few it can be said they toil not. How enviable the position, therefore, of the man who, having earned relaxation, can now pitch his tent under the greenwood tree or on the bank of one of America's grand rivers, with time for reflection, his tastes and sensibilities gently leading him in the direction of sport in forest and on stream.

It was my happy lot thus to pitch my tent for many a year on one of the most picturesque spots of that part of picturesque Canada, the bank of the St. John River. I could command a certain amount of leisure, and I lost no opportunity in winter and summer, with rod and gun, in seeking and finding sport to my heart's content. The birch bark canoe being the only means of transport in summer, the toboggan for provisions in winter, I had almost become an authority as to the geography of the country, as to the sources and courses of its numerous rivers, as to the whereabouts of the many chains of caribou barrens, and the favorite haunts of moose in secluded woodlands. In my many trips to the old country, in the capacity of globe trotter, I could not resist the temptation at the risk of being considered a bore—one given to relating marvellous traveler's stories—of pointing out to all seeking such information, that there is a field for the emigrant and the sportsman in the land of the setting sun, where the most bloodthirsty sportsman can be satisfied, and where with rod and gun he can say from his heart, enough. I could not help seeing a certain look of incredulity coming over the face of my nearest and dearest friend as I related these wonderful stories, though I had purposely endeavored to keep within reasonable bounds, as to the picture I drew of size and weight of fish, width of horns, etc., of moose, caribou and deer. This was sufficient to try the temper of the most angelic man. I could only say: "Come and see." It thus came about that two of my best friends (one a canon of the Anglican Church, the other a country squire), two of the most genial companions, the keenest sportsmen, and with an abundant stock of varied information and experience, resolved to pay me a visit to my Canadian home, accept my invitation to test the accuracy of my stories, or to put it in fine language, the foundation of my picturesque, if somewhat fanciful, description of sport in these parts.

Meanwhile, I had shifted camp from the bank of the St. John River, in New Brunswick, to that of the Ottawa River, in Ontario, and I had not time to acquire knowledge of the new country. The time selected for my friends' visit was unfortunate, it being midsummer, neither good for testing rod or gun. I was therefore rather handicapped in my efforts to show sport. Our first expedition, alas, was an utter failure. The Gatineau River was the route, a chain of lakes in the region of Kazabazna—within easy reach of the North Pole—the proposed fishing ground; the time, as already stated, that which suits the convenience of every conceivable insect of attack; means of locomotion shaky in the extreme—rickety wagon over rough and muddy roads, leaky canoe and ill-constructed catamaran on the lakes. Trout, moreover, were scarce—mere pan fish—and these would only rise in early morn or late evening, leaving the three fishermen during the hot summer's day open to the attacks of the insect pests, without any means of defense. To pass the time we resorted to our boyhood's plan of tickling fish—suckers assembled in cool brooks from the heated water of the lakes—and in this we were marvelously successful. But it was a novel sight, three individuals, who had at least passed the days of boyhood, the canon being one, adopting the prone position on the bank of the brook, engaged in the tickling process; and as each succeeded in securing a sleeping beauty (?) in the palm of his hand, it was speedily flung on the bank, amid a shout of applause. Afterward these fish were distributed among the neighbors, proving excellent for the table.

All the same this expedition did not by any means meet the expectations of any member of the party, so that "Is this all the sport you can show us?" was on the lips, if not actually expressed by my companions.

It was evident that I had necessarily to take some active step to regain what I had lost of fame as a voyageur of repute, as a safe steersman and guide. Having resorted to my well-worn map of the maritime provinces, and pointed out the different desirable round-trip routes for canoes and canoeists, from personal experience, our minds were quickly made up. We three, with the acquisition of my better half (well trained in roughing it and skilled in the commissariat department) resolved to turn our steps eastward. Steamer to Quebec; train (Intercolonial) to Campbell; thence by Restigouche, Upsalquitch, rivers, the lakes, Nepiseguit, Tobique and St. John rivers, by canoe, to Fredericton and St. John, if necessary, making a round trip of several hundred miles, much of which was, even to me, over new grounds, not having previously visited the Upsalquitch region. In order to facilitate our transit, I arranged that at the same time that we should start from Campbellton in three canoes; up the Restigouche River, with Mic-Mac Indians, four Milicete Indians, with four of their smaller canoes, should leave their camp at the mouth of the Tobique River and proceed to meet us wherever that meeting should take place, on lake or river, and thus enable the Mic-Mac Indians, on the relief taking place, to return to their homes on the bank of the Restigouche River. All this was satisfactorily carried out.

It is not my present intention to give details of this delightful round-trip canoe voyage. I merely desire to refer to one incident, which I cannot easily forget.

We arrived at Nepiseguit Lake late in the evening, barely in time to camp and cut wood before night set in. Having killed some fine 2-pounder trout in Neiseguit River before reaching the lake on the previous evening, my friends determined to try back, contrary to my advice, for I, from long experience, had spotted a pool, or hole, near our camp, which as a cool retreat for trout in midsummer, I considered superior to any fishing grounds we had yet found. "Two-pounders are good enough for us," they replied, in answer to my entreaties to try this pool. Off they went, therefore, at an early hour in their canoes, leaving me in full possession of the big hole, as we called it. I took it easy, without a great variety of flies, with light rod and strong landing net. I cast my first fly with full confidence of success. Scarcely had the fly touched the water than was in a fish, a good one, and from that moment until I had quite filled a space between two rocks on the bank with monsters, I was kept busy hooking, playing and landing fine trout, until I gave it up, having had fish and fishing enough to please the most ardent admirer of the gentle art.

Later my brother sportsmen were observed paddling hard to camp for the midday meal, eager to show the results of their morning's work, and soon they held up to our view some fine specimens of trout (they had only killed about a dozen fish), shouting, "I told you so!" for they were quite proud of their sport. A peep, however, into my larder, a veritable fishery exhibition, took the wind out of their sails and reminded even the canon that experience—the experience of an old settler—teaches.

This was for me and mine (for my wife shared my joy) a red-letter day.

Fishing Up and Down the Potomac.

Edward's Ferry.

WE have been to Leesburg on one of our former trips, but this time a team and double-seated dayton are waiting at the station platform, our grips and rod cases are stowed away and strapped behind, and before the train is out of sight, we three are hurrying as fast as the good gray mare can take us to the mouth of Goose Creek, five or six miles away. At the Creek we find the ferry boat, a primitive scow, flat, with aprons at either end to drive on and off and fold up for an end gate, when we are launched.

The engineer is an ancient colored citizen, who handles the propelling pole with a dexterity and deliberation which could only come with long practice.

Both the team and the ferry belong to our landlord, who has been warned of our coming and has sent for us.

We stroll about the quarterdeck of the scow and watch the minnows and pebbles in the shallow water—it is late, and we had not counted on doing any harder work this evening than eating the supper that awaits us; but a bass rising in the clear water, is too much, and two whose holiday is limited to twenty-four hours decide to make the most of it, unlimber the cases and fit the tackle for fifteen minutes under some inviting willows on the further shore, near the landing place.

The driver goes on to the house with the friend, whose particular haunt this is, at whose suggestion we had come, and who expects to spend the next ten days here, where he quietly puts in a week or two every year, and who is therefore not so impatient this first evening as we are.

We try the shore for a couple of hundred yards, but the willows are provokingly close to the water, and it is shoal too far out for a cast from the bank, where one is in plain view. A rise or two, and one foot-long bass, which is straightway returned, is the sum total of reward for our efforts, but we see fish rising freely further out beyond our reach, and vowing to bring to net on the morrow the identical individuals now tantalizing us, we do up and make for the house and supper.

Our friend has made himself at home, spread out his belongings, and with some ceremony introduces us to a compound of his own concoction, the ingredients of which are a secret, but cracked ice and sprigs of mint are in evidence, and the general result is satisfactory.

After supper we find our boatmen and arrange for our morning rendezvous and the campaign for the next day, and then retire early, with the soft murmur of the waters, a gentle breeze among the pines and poplars, and the katydids in the big trees about the house making "one grand, sweet song," a lullaby that no insomnia could resist.

When we make our start in the morning, we find that our boatmen know nothing about fly-fishing, and are to be of little help to us in finding the fish. They know well the deep places, where one may anchor the boat and catch bass with a minnow but have never paid any attention to shallow haunts, where the fly has the advantage, and it is to be a case of chuck and chance it for us; if we are lucky enough to find the good places, it is more than we have a right to expect in the few hours we are to have here.

Goose Creek opposite is very low, but also very muddy, and is discharging a lazy current of chocolate that hugs the bank and will not much disturb us so far as the main river is concerned, but we are disappointed not to be able to try its lower waters, for marvelous stories have been told of the number and size of the bass which have been taken here. However, it has been agreed that we are to go down, and we drift along shore for a while, but the water is slow and shallow, and we get nothing but the big sunfish; then we strike some rocks that make out into the river, and here we do better and pick up a few little bass, but nothing worth the keeping; then out across a carp wallow with muddy bottom, with now and then the dorsal of a big fellow showing. These places seem to be avoided by the bass, and any effort to secure them in these preserves of the carp are failures.

They are usually 5 or 6 ft. deep, and kept muddy probably by the carp rooting in the bottom, and the mud alone is enough to make the holes disagreeable for the nobler fish. The carp sometimes comes to the surface

of these, and with a lazy roll, like a porpoise showing his back fin, goes quietly down again. When they leave the water it is always with a straight upward leap, and they do not turn in the air like a bass, but seem to drop back tail first in almost the exact spot they came up. In this they are very different from the bass, which clears a foot or two of water and goes down head first.

The pickerel or jack hits the water a vicious flirt with his tail as he leaves it, and on a quiet pool it is easy to distinguish when you hear the splash what fish has tried a little flight.

We reach a great rock and a flock of little ones standing out across the river and marking the head of a long rapid. They are called the Hen and Chickens, and here are plenty of bass all about these, and good ones too, and we have stumbled on the ground we wanted! They are in the shadows and behind the rocks lying in wait for what the current may bring past their lair, and we get many a pretty run on our way across. But this trip is a sort of preliminary canter. We have so long heard of Edward's Ferry as one of the best points on the river, and we are exploring as well as fishing. The place is difficult to reach for a single day's sport, and expensive, and is consequently less fished than most points, which partly accounts for the fine fishing sometimes found here.

We drift down the riffles to Selden's Island, a long narrow, wooded strip on the Virginia side, separated

if the dirty looking shell lying there may not have a \$2,500 jewel inside.

The wind rises, the mountains in the west are backed by threatening clouds, and promise a thunder shower that will spoil the evening fishing; so the boatman, who is no more anxious to get a wetting than the angler, bends to his oars, and the heavy punt goes flying homeward like a canal boat.

The storm is over us when we land, and hurry to the house, but though the wind is high and the lightning is vivid and incessant, there is no rain for a half hour, and our friend comes to shelter just as a fearful crash nearby leaves us in doubt whether the roof is coming in or not, and the heavens open.

It was only a tree a quarter of a mile away, but we are content to do up the tackle and call the day done.

It may not be true of all places or all fish, but on the Potomac a thunderstorm sends the bass to deep water, and the fly is useless. It may be that in the holes they may be taken with bait when the earth is vibrating with the concussion of the rapid firing big guns of the sky, but they will not rise to surface lures then, nor for some time after. Perhaps the fact that a storm drives the flies from the water then, and they know it is useless to hunt until it is calm once more, may have something to do with their habit, but at any rate it is sure to leave's labor lost to whip in such a season that hope flies away before a thunderstorm.

In the Pound-Net.

BY FRED MATHER.

THE net seems to be working full time and is keeping full. A Fish Commissioner, in a letter on other matters adds this as a postscript.

How about the Smelt?

"Some time ago there was a discussion in FOREST AND STREAM as to the advantages and disadvantages of introducing the smelt into inland lakes, some claiming that it would clean out the trout fry, and others that it was grand feed for lake trout and other fish. Did you see it, and what is your opinion of the merits and demerits of the smelt?"

The discussion referred to was long ago, and is dimly remembered, although the arguments are forgotten and the arguers are not remembered. Taking the question as it is asked, i. e., for an opinion in a general way, without applying to any particular lake, I would say: The smelt seems to have been a salt-water fish originally, but one of anadromous habits, like the salmon and shad, running into fresh waters to spawn, with this difference: the salmon and shad enter rivers and remain there for weeks, and perhaps months, developing their eggs, some remaining a while after depositing them

SUNRISE FISHING ON THE NEW JERSEY SHORE.

By R. C. Leonard. Second prize in Class 3, FOREST AND STREAM Amateur Photography Competition.

from the main land by a chute so narrow the trees make a green arch over it in many places, that would sadly interfere with the fly; but one boat goes down this and the other outside. For almost the whole length of this island, the river is an ideal spot for a wader. It is only 2 or 3 ft. deep, the bottom is level save for the boulders with which it is paved, the current sharp, and we see bass every few minutes, which our big, unwieldy boat is scaring out. When one has once fished from a light skiff or canoe, he never has faith in any other craft for that purpose. But they are impossible for a large and heavy man, who soon finds them dangerous and frightfully tiresome from the cramped position the low narrow seat forces one to assume and keep. But when one can use them with comfort, they are without comparison the best ever.

When we are nearly to the lower end of this island and another, Gassaway's, is in sight, the boatman suggests the prudence of returning if we mean to hit the dinner at the house. My chum in the other boat had started down the chute between the island and the main land, only to find that the water was too low for any bass, and on coming out at the lower end, was so delighted with the prospects of fish in the long reach that he determined to spend the afternoon there, and in despair at rowing back to the house for dinner, he tied his boat to the bank and footed it up the towpath of the canal which skirts the river here.

After dinner my boatman proposes trying the water above, and as that suits our programme, we cover the river to the sharp rapid at the foot of Harrison's Island. There are some likely spots, but nothing like so attractive ground as below, nor are there so many bass in evidence.

There are several shallow, sandy reaches, and on the soft bottom may be seen furrows 3 or 4 ft. long, as if made with a cane, and at the end of each a half-buried fresh-water mussel. These are objects of curiosity since the fresh-water pearls of the Western rivers have attracted such attention, and one cannot but wonder

The direction of the wind and even its force has less certain effects. Bass have been caught with both spoon and fly when the surface of a lake was lashed to white caps, and the east wind is not fatal to chances, notwithstanding the fact that anglers have anathematized it since the beginning.

The "Gentleman Angler," printed in 1726 for A. Bettesworth (p. 24), says: "If the wind be in the east quarter it is stark nought. * * * according to this old Distich. The north bad, east worse, west good, but the south blows every bait into the fish's mouth." And under the head of the twelfth impediment: "If the wind be in the east, no fish will bite, except by chance, and that he is very hungry." But in 1873 a reviewer in "Nature" (Vol. 8, p. 220), commenting on Capt. St. John Dick's work on angling, says: "Yet there are lakes (notably Loch Leven, Kinnrosshire, probably the best trouting lake in Britain), in which the fish take best when the wind blows from that quarter." And we have found too that under the lea of a bushy bank, when either the May or perch fly is up, that the fish feed freely with the wind in the east, but in most climates and localities it may be admitted that the east wind is "good for neither man nor beast."

HENRY TALBOTT.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iv.

SEE in our advertising pages announcement of Game Laws in Brief expansion.

and becoming almost too poor for a crow to eat. The smelt enters the harbors in early winter and are caught by the ton in New England waters by angling through the ice. This is often the case as far down as Boston Harbor. They develop their eggs in salt water, work along up to the parent stream and await the ripening. Although some males may run up a few nights before the spawning begins, there is no general movement until the first eggs are to be laid; then the fish ascend to shallow riffles and lay their adhesive eggs on the gravel and are back in deep water by daylight.

This habit prevents the smelt from devouring young brook trout which do not go to deep water. At Cold Spring Harbor, Long Island, there was a stream below a high dam which had a run of 500 to 800 ft., part of the way over gravelly shallows before it reached the salt water. There were no smelt in the harbor, and I sent men to the south side of the island for three years for spawning fish, getting 300 or 400 each year. Outside of the work of Mr. Ricardo, on the Hackensack, who spawned the fish in grass-lined perforated boxes and let nature do the rest, nothing had been done in this line. We worked them in the McDonald jars, and had a great deal to learn; but, to shorten the story, we began to get eggs from our own stream in increasing millions, enabling us to stock other waters until I read that 48,000,000 smelts were planted from that station last spring; truly a good showing from the modest beginning, which like the hatching of tomcods, met with ridicule a few years ago, when I turned out a million fry in 1888, and thought it a grand thing.

The inquiring Commissioner limits his question to the smelt as an eater of fish or as food for them. He being an inland, fresh water, man, does not appear to know that the smelt as food for man, is the greatest delicacy which wears scales that comes to the seaboard markets from Nova Scotia to Virginia during the winter months, and that the little Hackensack smelts, which Norris thought a distinct species, and which only grow to a length of 6 in., sell in New York for 30 to 40 cents

per pound. Great smelts, weighing half a pound, come from Maine, but the small ones which, when properly fried, are eaten head, bones, fins and tail, are best. In winter the smelts are thrown on the ice and frozen, or into boxes, where they freeze. One can buy frozen smelts in New York city for 5 or 6 cent per pound, but at the same time "green smelts," i. e., unfrozen, bring three times that price, and they are worth it. To me, a fish which has been frozen is an abomination. No matter how carefully it may be thawed in cold water, there is a flavor that tells the story. Just as good for food, of course, but speaking merely of flavor. Freezing rather adds to poultry, but it ruins fish, as far as taste goes.

The smelt in large lakes, like Champlain, find their summer home in the deep waters where the great lake trout dwell; they may get a few young lakereels, but in New Hampshire the lakereels of Winnepesaukee—"Winnepesaukee" when I went to school—are smelt fed and have a wide reputation. One might as well object to the blueback trout of Maine, which are never seen, except at spawning time, as to object to putting smelt into stream-fed lakes, where there are hard-boned, spiny-rayed fishes which a fish can't digest as easily as it can assimilate a smelt.

Stock your lake-fed streams with smelt; they are no more predaceous than any other fish. If the lakes are large enough to have cool depths, they will live; if not, the trial costs little. They will never harm the young of brook trout.

Concerning Coots.

Whoopee! Here is something not at all fishy, which drifts into the pound-net, and it's about coots. Now, all you salt-water gunners are warned that the coot proper, of which Tennyson said in his "Brook":

"I come from the haunts of coot and tern,
I make a sudden salley,"

is a bird that probably you never saw, and you wouldn't know a coot if you did see it. We will not fight about it, if you will compromise and call your birds sea coots, and own up that they are not a bit like the bird which every naturalist is willing to swear is a coot.

Now, a real, bona fide, "so help me —" coot, is not a duck at all, but a member of the rail family, a bird which has a bill like a chicken and great long legs which end in splay-footed toes, which have independent webs on each toe; a bird as large as a spring chicken, but with its compressed body, long legs and neck, looks as large as a guinea hen. It is of a dark slate color, and in inland and Southern coast waters is called mud hen, blue peter, and in New Orleans Poules de eau, which a friend who once spent a month in Montreal to learn French, says, means "fowls of the water"; my old boatman in "the Louisiana Lowlands," pronounced the name of this bird "Pulldoo." But with this as an introduction to the thing itself, for it is best to know what a fellow is talking about, we will consider the coot.

A youthful friend named Charles Hallock, whom I first met on some woodcock ground near Albany, N. Y., in 1854, and fished with on Long Island in 1860, the same boy who founded FOREST AND STREAM a few years ago, writes me from North Carolina in these terms:

"Somewhere among your writings you mention eating the coot (*Fulica*), and a friend here declares that they are ducks, and as good as any duck. I remember to have eaten them once and found them 'sedgy,' like the rails, to which they are akin. Tell us how you found them."

In reply to this youthful sportsman, who, despite almanacs and recurring seasons, can walk the legs off a whole lot of fellows who were born about the time FOREST AND STREAM saw the light, let me say: Man is full of prejudice, and he inherits and acquires it. There is a prejudice against the coot that is not warranted. It is a fair table bird, and comparing it to ducks, would take a place below canvasbacks, redheads, teal, wood-ducks, mallards, black ducks, bluebills or broadbills, and others, and line up with whistlers and pintails; ranking away ahead of butterballs, all the fish ducks of fresh water and the old squaws and "coots" of salt water.

The shape of the bill tells one that the coot cannot catch fish, and its name of "Indian pullet" indicates its food. True, its mixed diet of seeds and snails may sometimes give it a "sedgy" flavor, but all fresh-water ducks eat the same things. It is possible that some individuals have more of this flavor than others; some mutton is more "muttony" than others, but the bird is eatable, and it is a sin—a mortal sin, a sin that cries to heaven—to kill it and not make use of its flesh for human food. The question of its capabilities of tickling the epicurean palate should not enter into the question. If the epicure does not care for the coot, there are thousands in New York city, and in other places who would be glad to get it.

It seems to have been my mission to fight prejudice against eating certain animals, principally fishes—sea robins, toadfish, etc.—and to take the unpopular side in the question of the superiority of the small-mouth black bass over his brother with a larger front door, yet, as a man who claims to be fairly honest, as the world goes, let me confess to one prejudice, wholly without foundation, you may say, and that is to tripe. I have never tasted it, and never will. The tripe is a good, wholesome animal, but I don't like the company it keeps. Outside of tripe, I will taste of any meat except human flesh, even to the roast monkey of the South American and African traveler, but when the tripe is offered I pass. This illustrates what a queer fellow a man is—no two are alike.

Eating Fresh-Water Mussels.

Right on top of the question about the edible qualities of coots comes this:

"Col. Fred: Last summer on a trip up Canadian rivers in pursuit of health, recreation and idleness, I found that the lumbermen fastened bushes to their rafts to collect the fresh-water mussels for food. The brush, which dragged into the open shells, was seized upon and the unios were brought in and boiled for dinner. I had brought 'Men I Have Fished With' and a few other books, and had read of your boyhood attempt at eating them raw with Steve Martin, but as the lum-

bermen cooked them, and with proper seasoning and the elimination of the tougher parts, they are not bad; try them again when you have a chance."

All right! I will do it. I did try to eat them raw and whole on a boyish fishing trip, to which my friend refers, and also had them served at one of the dinners of the now defunct Ichthyophagous Club, where we all partook sparingly because they were not to our taste, but it must be remembered that a French chef had prepared them, and he had never met the unio before. Now a French chef is exceedingly good in his way—soups, fish, joints and fancy dishes—but not one in a hundred knows the first thing about serving game birds; think of a "salmi of woodcock." The birds cut up, stewed down and soaked in some sort of gravy! Perhaps a sedgy yellowlegs or rail might be improved by such a disguise, but to so treat the king of all game birds, which is an honorary king only, and holds the place with only the Wilson's snipe as a rival, by reason of epicurean qualities alone, and then to disguise these flavors with sauces in a stew. Oh, Ichabod! Ichabod!

If we accept the dictum of Frank Forrester that the penalty for frying a beefsteak should be death without benefit of clergy, what should we do with a man who stews woodcock?

This digression from the cooking of fresh-water mussels by French chefs came in naturally, for they are never trusted by me to cook game, and while unios are not a little bit like game, they are not within the technical education of the chef. The Canadian raftsmen have a wealth of good fishes under them, and if they eat unios it is because they like them, and no doubt their simple cooking presents this mollusk at its best. Any competent guide, from Maine to Oregon, can serve brook trout, frogs, woodcock, wild duck or venison chops in a manner superior to any chef, and the reason is that they serve them au naturel, each with its own distinctive flavor. With this in mind, it seems as if the fresh-water clams might be edible; the Indians ate them, not from necessity, and Dr. Brinton* is quoted as saying that the "unios of the Tennessee River were sometimes cooked and eaten, as a change of diet, by the soldiers of the Army of the Cumberland during the Civil War."

Here is a field for experiment which should be worked by all men who can work it, to see if there is not a source of food, fairly edible, but not epicurean, at their doors. For too many years have we followed the prejudices of our ancestors who would not taste of certain things because they had such a wealth to choose from that discarded all that did not seem to be of the "first class."

I have not the Chinese respect for ancestors, nor their opinions. Surely my own forebears who were accused of witch-burnings in the olden days in Massachusetts would have held me and my opinions in detestation, and that evens the whole thing up. There have been changes since then, but prejudice clings. What I have hammered for years is prejudice against good wholesome food, which may not be of a kind to tickle the palate of an epicure, but will serve to give a poor man a dinner—and where is there a poorer man than one who is lost in a forest full of game, streams full of food, who starves amid plenty because of his ignorance?

In the cities there are people in dire need of a cheap food, which the fishermen throw from their nets by the ton, in the shape of skates, sea robins and toadfish in salt water, and gars, dogfish and sheepshead on the lakes. These are all eatable, but not saleable at paying prices; it does not "pay to handle them," and they are thrown back into the water to increase and multiply, while better species are killed for market.

The poor are crying for food; the fishermen cull out the best fish, cutting them off from breeding, and throws all others overboard, to increase. There is a great economic wrong done here, but a wiser head is needed to remedy it. In FOREST AND STREAM of Jan. 7, 1897, I related how fishermen in Great South Bay, Long Island, threw overboard seventy-one dogfish, the salt-water brother to the shark, in one haul, because it was too much trouble to kill them. The market-fishermen are more kinds of fools than I would care to write. They have not the first idea of the balance of nature's products, or that they are upsetting that balance by methods of fishing which were not known a century ago. They need missionaries to teach them that they have disturbed the natural balance, which all the different fishes maintained before they came, and that if they take certain favored species for market, it is to their interest to destroy all enemies of those species.

These unios often contain pearls, some of great value; their shells go by hundreds of tons to the button makers; they prohibit duck raising on the tide-water portion of the Pamunky River, Va., and some other Southern streams by closing valves on the foot of a baby duck, while the rising tide does the rest. In the shad fisheries I have seen dozens of them brought in with the seine, not dragged in, but with a grip on the twine which had entered their shells.

Hatching Black Bass.

An inquirer asks: "Has the black bass been hatched artificially, and if so, by whom, when and where?"

Fishculturists generally gave up the hatching of black bass as a bad job, yet they hatch other adhesive eggs. The trouble lies in getting the eggs from the fish, and the greater difficulty of obtaining milt from the male. As these fish watch their nests and fight off all intruders unless some giant carp finds the nest and devours the eggs, despite the attack of the smaller bass, there has seemed no pressing need of interfering in this matter. But I am informed that the bass are helpless against night marauders, such as the eel, catfish, and perhaps other things which have a taste for fish eggs, and that it is desirable to hatch the bass artificially, if it can be done.

The data are not at hand, but the only fishculturist known to me to have made progress in this direction is Mr. William F. Page, now at the U. S. station at Wood's Holl, Mass. Mr. Page had some bass ponds when in

*Bulletin U. S. Fish Commission, 1897

charge of the U. S. station at Neosho, Mo., some years ago, and took the eggs of bass, and I believe hatched them; his work may be found in the reports of the U. S. F. C., or its Bulletin. A letter to Mr. Page will no doubt bring the required references.

A Plea for the Fish Liar.

In every age and in every clime the children of men have been admonished and urged, entreated and commanded, by the tender counsel of loving mothers, and by the fiery eloquence of earnest evangelists, to abjure falsehood. From time immemorial the liar has been accursed without the slightest discrimination; prophet, priest and sage have most impartially and unmercifully jumped on the unfortunate violator of the literal truth, without the least regard for his previous condition, local environment or peculiar provocation to prevarication.

The illustrious monarch who united in himself the legislative, executive and judicial functions of the government of Judea, with an aplomb and vim worthy of the present autocrat of the House of Representatives, is credited with the naive confession, "I said in my haste all men are liars." The royal moralist doubtless intended his readers to infer his omitted corollary, to wit: that all men were consequently victims of total depravity.

This brief exordium is quite sufficient to introduce to the attention of the readers of FOREST AND STREAM the gross injustice which has been done to the gentle piscatorial prevaricator, by these injudicious and indiscriminate ex cathedra fulminations. As the symbol of a fish once stood for faith in the Christian religion amid the polytheism of the Greeks and Romans, so now should the figment of the fish liar typify the tender trustfulness of human nature.

But before entering upon an argument, it is important to agree as to our premises; for upon the soundness of this foundation rests every conclusion of the subsequent logical superstructure. Let us then take counsel together, and if possible agree upon the nature of a lie, and the measure that should be meted unto it. The essence of every fault, whether crime or peccadillo, lies not in the commission, but in the intent of the delinquent; and especially is this the case in the matter of lying. The bearing of false witness against a neighbor, whereby he may be injured in person, property or the pursuit of happiness, is very properly reprehended as a sin of the darkest dye; while an indulgence in the felicitous flights of fancy, so far from being a vice, is a positive virtue.

Did not that carefully accurate Oxford professor of mathematics do far more for humanity as Lewis Carroll, in the perpetration of his delightful yarns, than as Charles Dodgson with his prosy demonstrations of the exact sciences? Let us then distinguish between the mean and malicious, and the pleasant and effusive liar; and it may be taken for granted that the most radically Puritanic moralist, and the keenest of diplomatists, to mention conventional extremes, cannot but agree upon this distinction.

There are then liars and liars; there are bearers of balm, as well as of bane, for their fellow creatures; the one properly subject to commination, excommunication and all other kinds of sequepdalian condemnation, by bell, book and candle; the other well worthy of the grateful acknowledgments of the edified, mystified and satisfied mortals whose good luck has brought them within the magic circle of their kindly influence. "All the world loves a lover," and agape with envious admiration, we of the angler's world, listen with delight to the glowing tributes paid to the charm of his beloved art; and we love the cheerful fish liar as we love ourselves, for are we not all waiting for our turn to tell of our "sock-dallager"?

Who of all men deserves one-half so much of our enthusiastic admiration and heartfelt appreciation of his talent to cheer and charm us by the cosy fireside of a stormy winter night, or in the unspeakable dulness of a rainy day in camp, as the resourceful and generous fish liar? Mark the artistic skill with which he handles his airy tackle, playing his audience as he erstwhile did the monarch of the pool; now with apparent abandon and cunning carelessness, and anon with a vigor and tenacity of purpose which characterizes the fortiter in re, suaviter in modo of the expert angler. Observe his careful attention to the details which lend a vraisemblance to his baseless fabrication, his graceful divagations from the main lie to introduce unimportant truths to serve as pegs whereon to hang minor ornamental lies. Grandly presiding over this Barmecide's feast, our genial host, following the bent of his naturally philanthropic disposition, smilingly ladles out with liberal hand to his rejoicing convives, from the bowl of benevolence, bumpers brimming with the milk (punch) of human kindness.

No "mute inglorious Milton," chilled by the penury of cold facts, is our dear, delightful insouciant fish liar; but a genuine favorite of the Muses, a licensed angler in the sparkling stream that flows from the Heliconian fount, that wellspring of poetry and piscatorial possibilities. Away then with your Gradgrinds, your grovellers in dull facts, your uncompromising dwarfers of intellect! Can there be salad without salt? Perish the man who would not for sweet mercy's sake occasionally indulge in the judicious and tasteful amplification of mere facts, which are by their nature, absurdly limited.

Perhaps there never was a greater falsehood than the one concealed in alleged truism to the effect that beauty needs no adornment. What manner of man is that, who, if he possess a peerlessly beautiful woman for his own, doth not seek to enhance her charms by decking her with jewels of great price? Where is the proud mother who delights not to exhibit her babe of more than earthly loveliness, draped in the most expensive lace and lingerie? I don't know what "lingerie" is, but it is a good word, and I will leave it and take my chances of some fair reader calling my bluff. All this being true, how much more are we bound to clothe our own darling children of the imagination, our grandest achievements by field and flood, in the glowing garments of rhetoric whose figures of speech are ample enough to provide all the necessary padding, as well as the glittering umptaras of sparkling jewels to cap the climax.

Some of the most venomous, narrow-minded and

addle-headed old liars of antiquity, as well as many of the jejune, unimaginative, unfruitful and useless liars of the Middle Ages, have been canonized as saints in glory—after they were dead. Shall we then allow our loving and lovable fish liar, the genial benefactor of his race, to take any chances of becoming anathema mar-anatha forever? Forbid it, St. Ananias! rather let us witness his apotheosis ourselves and see to it that the job is well done.

Candor should compel the confession that after all it is nothing but sheer envy, hatred and malice, coupled with congenital poverty of imagination on the part of hoi polloi who cannot compete, which has caused all the unkind criticism of our hero. I fondly trust that each and all of the readers of FOREST AND STREAM—and their name is legion—will gladly join with me in the lofty aspiration that this victim of jealousy may live a long and useful life; and when in the fullness of time he shall be gathered to his fathers, there will be no need for the absterive tear of the pitying angel to blot out from his record the pleasant faradiddles of his mortal life—that no ticket of admission will be demanded by St. Peter, who was, heaven bless him, a fisherman and the revered author of some pretty good fish stories himself.

Let us reverently deck his humble tomb with our grateful garlands of tear-moistened lilies, and carve lovingly upon the mortuary marble the modest but suggestive epitaph:

"He hath done what he could—
—and more, too."

ZERO.

Forests and Trout Streams.—I.

Editor Forest and Stream:

I send you the substance of an article read before the annual meeting of the Minnesota State Forestry Association, by Frank H. Carleton, of Minneapolis.—Geo. W. STRAND, Secy.

Why Forest Preservation Should Interest Fishermen.

BY FRANK H. CARLETON.

As an angler it would do my heart good to dwell upon angling as a recreation; beneficial and enjoyable to all, from the barefoot boy, with his simple hook and line, and pole cut from the neighboring wood, to the disciple of Izaak Walton, who, with delicate bamboo rod, deftly casts his artificial fly—a sport equally enjoyable to all, from the man whose physical labor is hard, and who occasionally gets a day off to "go a-fishing," up to the great Webster, who composed, while angling at Marshpee Brook, parts of his famous oration afterwards delivered at the laying of the corner-stone of Bunker Hill Monument.

It is true, as Izaak Walton wrote in his "Compleat Angler," published nearly three hundred and fifty years ago, "Angling is the contemplative man's recreation. It is an art, and an art worthy the knowledge and practice of a wise man." Every fisherman knows that to be a good angler requires excellent judgment, great practice, rare skill, a full degree of endurance, and a lively imagination. Perhaps the last-named quality of a lively imagination is not absolutely necessary, but it helps tremendously when "luck" is bad and the fish don't bite, and it develops the poetic and æsthetic features of the art, and gives that intense love of nature which every true angler should have. And were a moral argument needed in favor of angling, we could cite the good and wise men of all ages, from the fishers of Galilee down, or I might say up, to the venerable episcopal bishops of Minnesota. I therefore conclude that fish are now, always have been, and always should be of inestimable value to man as a food product and source of wealth; and that angling is an art which affords the highest degree of outdoor recreation, skill and enjoyment for the indoor worker and the business and professional man of overworked brain.

To have fish and fishing we must have an abundance of water suitable for the propagation and growth of fish, and an ample supply of food for the fish. Without forests we cannot have fish or fishing.

But it may be asked what have the preservation of forests and reforestation to do with fish, fish food and fishing? To those who have studied the results of forest destruction these statements need no explanation, but for the benefit of others I briefly refer to a few facts, well known to those who have given study and attention to the subject.

Well-wooded districts are subject to more rain than treeless regions; and forests are vast reservoirs of humidity, lessening the dryness of the surrounding atmosphere, aiding the flow of springs and streams, and throwing off great volumes of humid air. Not only do they prevent freshets and overflowing banks, but they hold back the melting of the snow and ice in spring, and through the warm months of summer they feed the springs, streams and lakes slowly with a constant quantity of pure and cold water, thereby making the supply of water more constant and reducing the temperature of the water in the streams and lakes, and giving the clear and cold water in which fish delight and thrive.

Years ago Humboldt wrote: "In felling trees * * * men under all climates prepare for subsequent generations two calamities at once—a lack of firewood and a want of water." And John Crombie Brown, the great British authority on forestry, has summed up the subject in these few words: "In a well-wooded land the rain may be found to be diffused in showers over a great part of the year; while in a land otherwise under similar conditions, but devoid of forests and other vegetation, the rain falls at distant intervals—months or years apart—and falls in torrents. And again, in the former case, the rainfall may be generally diffused over the whole area; in the latter it may fall in torrents here and there, leaving extensive regions unvisited by rain for long periods."

There is no substitute for forests as producers of rain, either by irrigation or by attempts to blow up the clouds and bring down water by fireworks; and where irrigation is feasible it cannot continue long on any large scale after the forests are gone.

That the want of forest protection has produced terrible results and great disasters, caused by the intermittent and irregular action of long droughts and great floods and inundations is evidenced by the history of Spain, Italy, France, Sicily, Chili, Peru, Mauritius and

many other countries; and especially by Western sections of the United States. But these questions are also of the greatest importance to fishermen, and it is time that they fully appreciated the importance of forest protection as a means of yielding a constant supply of water, food and shelter for fish; and well understood that the destruction of the forests, more than any other factor, has reduced the supply of fish and fully explains why fishing has so rapidly declined in this State within the past few years; and fishermen must understand that if forest destruction is not stopped the years of fishing in Minnesota are numbered.

Twenty years ago Minnesota was a fisherman's paradise. Until the destruction of its forests began Minnesota was famous throughout the country for its numberless lakes and streams of clear cold water, teeming with the gamiest and most edible of fish. The temperature of its land and water was such as to promote the propagation, growth and development of the greatest abundance of solid and deliciously flavored fish, so unlike the soft, flabby and tasteless fish of regions south of us. A generation ago the great system of lakes, marshes, springs, rivers and giant forests, which went to make up and protect the sources of the great Mississippi had no parallel in the United States east of the Rocky Mountains; while the lesser systems of the Minnesota, the Red River of the North, and the St. Croix, and their many tributary lakes and streams, were great sources of water, of which many nations would be proud and desirous to conserve.

But with the destruction of the forests of Minnesota the same results in the diminution of water supply have followed as in the older countries of the world, where forest destruction has gone on, and we are but repeating history. The lakes and rivers have receded, the springs have dried up, the rainfall has decreased, and the atmosphere has lost much of its humidity. That the water shrinkage has been exceedingly large is a fact known to every observer. To-day Minnesota is full of dried up lakes and streams. As we ride through the country we see from the car windows grass growing in what a few years ago were the beds of large bodies of water, where fish were once abundant. As I read these sentences, each of you can recall lakes and streams which have seriously declined in depth and size, or have dried up altogether. Stand on the beach of almost any lake in Minnesota and cast your eyes shoreward and you can easily see the shore line of a generation ago, when the water stood 6, 8 or 10 ft. higher than it does to-day. But this is not all, for from year to year we can see that the drying up process is still very rapidly going on. Many of the lakes have become grass plots, and many brooks have widened into broad expanses of sand or gravel over which in the summer season we pass dry-shod. The interesting address of Walter C. Brower, which has been published by the Minnesota Forestry Association, describes in a most authenticated manner the extent of water decrease in Minnesota, and is worthy our most careful consideration.

As agriculturists you know how quickly an unprotected hill loses its soil. The rain is not stored in the earth to feed perennial springs, but it runs off in torrents, bearing away a portion of the vegetable glebe and rich surface soil, and the freshets of spring soon take the rest; and you know that this soil, which is thus washed away is the rich organic mould which the earth most needs. And one severe storm may wash away in a week the rich fertilizing matter which it has required centuries to accumulate.

It has been estimated that not less than 10 per cent. of our soil is carried away by rills, streams and floods. During the present week, as I have seen farmers patiently hauling loads of manure from the stables of this city to place upon their lands, I have thought seriously of the fact that the torrents and floods of the coming spring would doubtless strip their lands of more fertilizers than they could haul to their lands in manure carts in a month of patient labor.

But this loss of the richest part of the soil is not to the land alone. Let me ask you where is this rich soil mostly carried by the torrents and floods? Is it not into the beds of lakes and streams, where it is not only not needed, but where it is a positive injury, choking the channels of the rivers and streams, and forming large sandbars in the lakes, thereby greatly reducing the depth of water if it does not entirely overcome it? And just here saying nothing about the serious loss to the land, a great damage is done to the fish. The clear, sandy, gravelly or rocky bottom of the lake or stream which the fish love, and on which they feed and have their spawning beds, is covered with the rich mould from the fields, forming a muddy sediment, which the fish do not like, and the feeding grounds and spawning beds are greatly reduced and often destroyed. The deep holes where fish resort are filled up and the lake or stream is made shallow. Moreover, the water vegetation, on which the fish feed at certain seasons, is covered with the washings from the land, is destroyed, and another source of food for fish is annihilated. This last proposition that the accumulation of soil and mud in the bottom of streams is inimical to fish is true of all the higher grades of fish, but to it there is one exception, and that exception is as to catfish, called in common parlance bullheads. Bullheads thrive in muddy bottom and increase to an alarming extent. They are the gluttons of our waters. But beware of them, for when they once get possession of the waters, it will not be long before the best varieties of fish disappear.

[TO BE CONCLUDED.]

Fish Propensities.

Editor Forest and Stream:

I find the annexed excerpt from the London Field in my scrap book; I think Mr. William Senior is the author. It touches a subject seldom commented upon, which will interest the fishculturists.

C. HALLOCK.

"I have already made slight reference to some of the different species of trout that inhabit our waters, many of them magnificent fish, but all off-shoots from the one original stock, viz., the brook trout. These different races have developed under varied circumstances. We have the trout that feed very largely on shell fish (*Gillaroo*), acquiring a much thicker coating to the stomach, and usually growing to a good size and being excellent fish. Another race having taken up with cannibal propensities (as

the *Ferox*) develop a more powerful lower jaw, and, just as in the case of any beast or bird of prey, becomes of fiercer disposition, and acquires at the expense of their smaller brethren a considerable superiority in size, though unfortunately the improvement, if it may be said to be one, ends here. Artificial cultivation develops the fact that the offspring of both these species revert to their original type (*Fario*). It is possible to get young Gillaroo trout, but I have never yet met with any one who has been able to produce a young typical *Salmo ferox*. The reason is obvious. I have hatched the ova of *Ferox* and reared the fry, but they, in no way, that I could see, differed from *Salmo fario*. Other fish develop the *Ferox* type as well as trout, for I once had a pond full of *S. fontinalis* (really char) that likewise exhibited cannibal propensities, and they became such brutes that I at once proceeded to knock them on the head, as being the best way of getting rid of them. On the other hand, I was one season very short of pond room, and put into one pond about an equal number of *S. fario* and *S. fontinalis* yearlings. At the end of two years the pond was emptied, and the *Fario* had done very well, but they had bullied the *Fontinalis* horribly and stunted them in growth. I have often tried the same plan, and always found it answer admirably before. This, however, is but an illustration of one of the many eccentricities which trout develop under different circumstances.

CHICAGO AND THE WEST.

Spring Bass Spearing on the Fox.

CHICAGO, Ill., March 4.—I have direct and reliable information from St. Charles, on the Fox River, just west of Chicago, that the spring run of bass has already begun. The ice is very thick over the river at that point, but at places along the dam and mill flumes it has broken away so that the open water is shown, and in this open water can be seen swarms of bass. At night a light flashed down into the water shows up the fish distinctly. It is a very simple matter to stand on the edge of the ice and spear the bass, and very large numbers of them have been taken in that way this week.

Ice Fishing in Minnesota.

Mr. H. B. Jewell writes me from Wabasha, Minn., advising me that the prosecutions against State Warden Fullerton, which have been tried at Wabasha, have ended in the triumphant acquittal of Mr. Fullerton. Last January Warden Fullerton burned twenty fish houses on Lake Pepin. He was sued in civil damages by a man named Oliver, but the court has held that the warden acted within the law and was not liable. Commenting on this sort of thing, Mr. Jewell has the following words of wisdom:

"It is said that these fishermen, who run their nets and spear through the ice in the winter season do not get anything but coarse fish, but that's all buncombe. They take lots of other fish. A good many wall-eyed pike are taken. I know of a man who speared a wall-eye recently that weighed 13 lbs., and was full of spawn. These fellows claim that they have to fish in the winter to make a living. How the deuce do all the other fellows live that can't fish, I would like to know? The fact is it's an easier, and one might say a lazier way of making a living than chopping wood, or a hundred other things a man might do in the winter."

E. HOUGH.

1200 BOYCE BUILDING, Chicago, Ill.

Summer Fishing Near New York.

Editor Forest and Stream:

Noting with interest Mr. Fred. Mather's article in a recent issue on winter fishing near New York city, I venture to write on the merits of fishing done around New York and vicinity in summer and fall. Having had a little experience in this locality with hook and line myself, I trust the following chapter will find some interested readers.

Taking in the waters around Staten Island to start with, I presume every angler knows where Princess Bay is; he ought to know, anyhow, as there is no better place for obtaining a heavy basket of porgies and weakfish, to say nothing of seabass. There, one day last August, I had all I could do to pull up and bait my hook for the hungry fry. I distributed half my mess among the villagers, as I could never have got home with the whole bunch. I had a basketful and a string over each shoulder. At any season in the fall a goodly supply of sea bass of desirable size can be hooked. I hope next season I will find a lot of envious fishermen at this spot for they will get all the sport they want, and all the fish they care to carry. The Shrewsbury, near by, is a paradise for crabs and nice ones at that, and the lovers of crabbing will find something in store for them when they visit this place.

I do not need to say anything about the fishing banks. They are a common word on every angler's lips around here, and I will let them take care of themselves.

Going away over to New Jersey, we have the Hackensack, Ramapo and Saddle rivers, the first being a desirable resort for white perch, which run in great numbers below Little Ferry and under the railroad bridges. I already have taken striped bass among the rocks in the middle of the river, but not large ones, and few at that. Saddle River is out further, and is most easily reached by train from Jersey City. It is a favorite spot for pickerel and black bass, and many a holiday has found me there and many another will. Ramapo River is about the same thing over again, and is a good locality for small game, and a desirable place for camping out.

Bound Brook, N. J., is well stocked with black bass, which is the favorite fish here, and many a train lands a score or more of eager fishermen, after the noble fish.

Reaching Greenwood, which is the favorite haunt of the city anglers, it is not worth while to say anything about it, as doing so is telling what everybody knows. I view it as the home of the sunfish, the little creature that supplies great sport for fly fishermen.

I see I am not writing under the heading I started with, and I think it is about time to stop, as Greenwood Lake is not quite so near New York city as I was thinking it was.

W. G. I.

The Taylor System of Fishing.

BALTIMORE, Md., March 1.—*Editor Forest and Stream:* Noting "The Taylor System" in issue of March 4, it seems to me that the delivery of the fly and the manipulation of it after delivered consists the whole secret of success in killing trout. It is not so with salmon, as I understand the mode of casting for salmon. I do not give much account to the Japanese style of fishing, and will not discuss it. It seems to me as savoring of the "fish hog" arrangement.

With reference to the manipulation of the fly, I want to say that once when on a trip to North Elba, New York State, I was fishing in a stream that flowed into Saranac Lake, my friend Bosley called my attention to a large trout that had come up to the surface of the stream to take in such flies as there were at the time existent. I had not any such flies nor any even approaching the colors. I was determined to have that trout. He was a big one of 3lbs. and over. Carefully approaching the stream I dropped a coachman as the first dropped from the stretcher and manipulated it by a tremulous motion of the rod to represent the efforts of the fly to get off the water. The effect was, as I expected, instantaneous. The trout took the lure and I landed him safely—2½lbs.. But the satisfaction of killing the trout was largely marred by the remarks of my friend Bosley, who was watching the cast, "Well," he said, "that was the meanest thing I ever witnessed, to think you would deceive a trout in that manner." He did not, however, refuse to eat a portion of that very fish. E. S. YOUNG.

The Taylor System in England.

PHILADELPHIA, March 4.—*Editor Forest and Stream:* I subjoin a contribution to the early literature of the "Taylor System" of fly-fishing, thinking that it may interest others. I have a faint recollection of having read another account of the Midland fisherman referred to below, but cannot find it now. The quotation given below is from "Days of My Life," by John Bickerdyke, London, 1895:

"The use of fine gut for fly-fishing for trout, and the necessity of keeping well out of sight, as so generally acknowledged and put into practice by all fly-fishers worthy of the name, that I need hardly dilate upon them here. I will only mention that I know (by report only) of a most successful trout angler in the Midlands who uses extraordinarily thick casts and large flies, and yet brings home larger baskets of fish than his neighbors. His practice is to stand well back from the bank, and with a long line to cast his heavy fly into nooks and corners, where anglers with light tackle cannot, as a rule, safely penetrate. In such out-of-the-way places he finds, I suppose, confiding trout who take his fly for some beetle or caterpillar dropping from the bushes above (I am told it goes in with a good splash), and so rise and take it. Anyhow, he catches fish, which are queer things; I do not mean his fish in particular, but fish generally."

Here is, apparently, an independent discovery on the same lines as Mr. Taylor's. When the final history of the movement toward a heavy fly and a big splash in fly-fishing comes to be written, this gentleman in the Midlands must not be overlooked. R. J. PHILLIPS.

The Kennel.

Fixtures.

BENCH SHOWS.

March 7-10.—Grand Rapids, Mich.—Butterfly Association's bench show. Miss Grace H. Griswold, Sec'y.
March 14-17.—St. Louis, Mo.—St. Louis Kennel Club's show.
March 21-24.—Chicago.—Mascoutah Kennel Club's show.
April 4-7.—Boston, Mass.—New England Kennel Club's bench show. James Mortimer, Manager.
Nov. 22-24.—New York.—American Pet Dog Club's show. S. C. Hodge, Supt.

New England Kennel Club.

In addition to the special prizes announced in the premium list of the New England Kennel Club's fifteenth annual dog show, are the following:

The Boston Terrier Club offers a club cup as follows: For the best Boston terrier puppy, respectively in the novice classes, light weight limit classes, heavy weight limit classes, open classes; for best dog in the show, and best bitch in the show; for the best brace of puppies, the best brace of Boston terrier, and for the best four, comprising light weight dog and bitch and heavy weight dog and bitch entered and owned by one exhibitor.

The breeders' trophy, value \$100, for the best dog or bitch bred by the exhibitor.

The challenge trophy, value \$100, for the best dog or bitch owned by the exhibitor six months prior to the close of entries. Entries for this trophy to be made with the secretary of the Boston Terrier Club, box 2790, Boston, Mass., on or before April 1, accompanied by an entry fee of \$3. The winner to receive 50 per cent. of the stakes, second 30 per cent., and third 20 per cent.

The puppy bowl, value \$50, offered by Dwight Baldwin, Esq., for the best puppy between the age of six and sixteen months, registered in the A. K. C. S. B.

A silver vase, value \$50, offered by G. N. Phelps, Esq., for the best brood bitch shown with two or more of her produce, which must be entered in their regular classes, but need not be the property of one exhibitor. Donor not to compete.

The winners of the above trophies will receive a club cup in commemoration of the award. The breeders' trophy, challenge trophy, puppy bowl and silver vase must be won three times before becoming the absolute property of the winner.

A club cup for the best Boston terrier in the limit classes.

The above trophies and cups are open to members only.

The American Scottish Terrier Club offers to members only: A challenge cup for the best American-bred Scottish terrier dog; a challenge cup for the best American-bred Scottish terrier bitch.

JAS. MORTIMER, Supt. and Sec'y N. E. K. C. Show.

How?

ROCHESTER, N. Y.—*Editor Forest and Stream:* I have a young beagle hound that I am anxious to make a coon dog of next fall, but I don't know how to go about it. There is no dog that knows how to tree coons around here that I could get to break him with. How can he be prevented from running rabbits at night?

A beagle is, of course, too small to tackle a coon, but I am told that if properly broken, they are excellent dogs to tree coons with, and then the coons can be shot.

Would a dead coon or coon skin dragged around on the ground and then up a tree be good to teach a dog to bark up? I am told that the scent left by a coon and a cat are much alike; how would it do to break the dog on cats? or could a coon be trapped and led around for the dog to follow?

If any of the readers of FOREST AND STREAM could give me pointers on breaking my dog they would be thankfully received.

HOWARD S. THOMPSON.

Points and Flushes.

Under date of March 2, Mr. Thos. J. Chappelcar writes us as follows: "Your critic, in reviewing the Chesapeake in New York dog show, has made a great error. He says Brent, third, was very closely pressed by Duchess, reserve. Duchess rightly took first. Her coat has never had its superior."

Spratts Patent (Limited), 239 East Fifty-sixth street, New York, call special attention to their improved (new style) medicines, as well as their prepared foods and elaborate stock of dog furnishings. A catalogue containing a complete list, will be sent to applicants.

Modern Dogs (non-sporting division) has been amplified in a new edition, the famous author, Mr. Rawdon B. Lee, having added such matter as pertains to the changes since the first edition was issued, now about five years ago. The illustrations are by Messrs. Arthur Wardle and R. H. Moore, and it is hardly necessary to add that they are the most perfect illustrations of their kind.

Rifle Range and Gallery.

The National Sportsmen's Association.

The programme of the revolver and pistol matches, under the auspices of the National Sportsmen's Association, at Sportsmen's show, Madison Square Garden, New York, March 2 to 15, provides a variety of events. The ranges will be open from 2 P. M. until 11 P. M. each day, except on last day, when they will be closed at 9 P. M. Messrs. Zeitler Bros. will have charge of the ranges, and will furnish revolvers and pistols and suitable ammunition.

Match A—Any Revolver Championship.—Prizes: First trophy, value \$50; second, \$25; third, \$15; fourth, \$10; fifth, \$8.

Arms.—Any revolver not over .45cal., with barrel not over 7½in. exclusive of cylinder.

Sights must be strictly open. Trigger pull shall not be less than 2½lbs. Number of shots: This match calls for five 6-shot targets, a target to consist of six consecutive shots. Targets: Standard American, 2½in. bull. Cleaning allowed between scores. Ammunition: Any ammunition allowed. Entrance fee for this match is \$3. Distance, 20 measured yards. Ties will be decided by draw. Re-entries allowed; five targets for \$1, or 25 cents each.

Match B—Military Revolver Championship.—Prizes: First trophy, value \$50; second, \$25; third, \$15; fourth, \$10.

Arms.—Only military revolvers, which are regularly for sale, and which can be bought in the open market on the date of this circular allowed.

Sights must be open and fixed military sights with which the revolver is issued. Trigger pull: Not less than 4lbs. Target will be standard American, 2½in. black. Number of shots: This match calls for five targets of 6 shots each, a target to consist of 6 consecutive shots. Cleaning allowed between scores. Ammunition must be the regular full-charge service cartridge intended for this arm. Entrance fee \$3, as in Match A. Distance, 20 measured yards. Ties will be decided by draw. Entries unlimited, at 25 cents each target, or five for \$1.

Match C—Pistol Championship.—Prizes: First trophy, value \$50; second, \$25; third, \$15; fourth, \$10; fifth, \$8.

Arms.—Open to all .22cal. pistols, barrel not over 10in.

Sights strictly open, not over 10in. apart. Trigger pull not less than 2lbs. Targets, same as in Match A. Number of shots: Best five targets, 6 shots each. Cleaning allowed between scores. Ammunition: Any .22cal. rim fire. Distance, 20 measured yards. Entries unlimited, at 25 cents a target, five for \$1. Ties will be decided by draw.

Match D—Police Revolver Championship.—Prizes: First trophy, value \$50; second, \$25; third, \$15; fourth, \$10; fifth, \$8.

Arms.—Only .32cal. police revolvers, which are regularly for sale, and which can be bought in the open market on the date of this circular, allowed.

Sights must be open and not over 6in. apart. Trigger pull not less than 2lbs. Number of shots: five best targets, 6 shots each, consecutive. Targets: Standard American, 4in. bull. Cleaning allowed between scores. Ammunition: Only factory ammunition allowed, full charge. Entrance fee \$3, as in Match A. Distance, 20yds. Ties will be decided by draw. Entries unlimited, targets 25 cents each, five for \$1.

Point Target Contest for Trophies.—Any revolver, distance 20yds., point target, 2½in. black; count 1, 2, 3.

Number of points: To win trophy 50 points shall be made on this target. Entrance fee, 25 cents for 5 shots; re-entry allowed.

Pistol, .22cal.: Conditions the same as in Any Revolver.

Military: distance 20yds, point target, 2½in. black; count 1, 2, 3.

Number of points: To win trophy, 30 points shall be made on this target.

Entrance fee 25 cents for 5 shots; re-entry allowed.

Police revolver: Distance 20yds., target 4in. bullseye; count 1, 2, 3.

Number of points: 50 points to win trophy on this target.

Entrance fee 25 cents for 5 shots; re-entry allowed.

Cincinnati Rifle Association.

CINCINNATI, O., March 5.—The following scores were made in regular competition by members of the Cincinnati Rifle Association, at Four-Mile House, Reading Road, to-day. Conditions: Off-hand, at the German ring target. Gindele was declared champion with a score of 222. Strickmeyer's 66 was high on the honor target. A blustering wind prevailed throughout the day:

Champion score:	22	23	23	15	24	23	23	23	24	222
Gindele	23	21	22	22	22	23	21	22	21	217

Rifle at Shell Mound.

SAN FRANCISCO, Feb. 27.—*Editor Forest and Stream:* A fitful wind greeted the marksmen at Shell Mound range yesterday. There was a good attendance at all the club shoots. The militia shooting stalls look very forlorn, as our San Francisco regiment is on the fighting line at Manila.

F. P. Schuster and Dr. Rodgers had their usual hot contest. This time it was for the all comers' Blanding medal, Germania Club. The conditions are: Only one score of 10 shots, 200yds., 25-ring target. Schuster started out with 121 in his first five shots, but broke and wound up with 226. The Doctor made 228.

Scores of Germania—for the Bushnell medal: Dr. L. Rodgers 228, F. P. Schuster 226, A. Strecker 209.

Yearly competition shoot for cash prizes: F. P. Schuster 72, A. Strecker 72, Dr. Rodgers 71, D. B. Faktor 70, C. Thierbach 70, H. Stelling 68, N. Ahrens 68, William Goetze 67.

Monthly bullseye shoot: J. F. Daly 228, R. Finking 326, Dr. L. O. Rodgers 395, J. Beottler 396, A. B. Faktor 445, F. Rust 535, H. Stettin 629, N. Ahrens 777, J. Utschig 787, F. P. Schuster 841, C. Thierbach 391, J. F. Bridges 1,059, R. Stettin 1,150, R. Haake 1,281.

Columbia Pistol and Rifle Club—Shoot for Glindeman all comers' rifle medal: A. H. Pape 41, 44, 46; F. O. Young 56, 59, 60; G. Manuel 92, 102; Mrs. Manuel 95; E. N. Moor 111.

Siege all comers' pistol medal: F. O. Young 41, 50, 55; G. M. Barley 51, 52, 54, 56, 60; C. M. Daiss, 42, 49.

Daiss' all comers' and Jacobson's members' medal, rifle: Geo. Mannell 28, 29, 30, 34.

ROEL.

Trap-Shooting.

If you want your shoot to be announced here send in notice like the following:

Fixtures.

March 2-11.—Madison Square Garden.—Tournament in connection with Sportsmen's Exposition. Address, Sportsmen's Exposition, 280 Broadway, New York.

March 17.—Hoboken, N. J.—Hackensack River Gun Club's handicap shoot at live birds, at Hefflich's Hotel. Open to all. Main event, 10 live birds, \$5 entrance. John Chartrand, Sec'y.

March 23.—Brooklyn, L. I.—Live-bird handicap of the Brooklyn Gun Club, at Lyndhurst, N. J. John Wright, Manager.

March 25.—Pawling, N. Y.—Postponed shoot of the Pawling Rod and Gun Club. Geo. S. Williams, Sec'y.

March 29-30.—Richmond, Va.—Tournament under management of W. C. Lynham. Targets and live birds.

April 4-5.—Chambersburg, Pa.—Chambersburg Gun Club's spring live-bird and target tournament; open to all. J. M. Runk, Captain.

April 11-13.—Elkwood Park, Long Branch, N. J.—The Interstate Association's seventh annual Grand American Handicap tournament. Entries close April 4. Edward Banks, Sec'y, 318 Broadway.

April 18-20.—Lincoln, Neb.—The Lincoln Gun Club's second annual interstate tournament; targets and live birds; \$500 added. Geo. L. Carter, Sec'y.

April 18-21.—Baltimore, Md.—Prospect Park Shooting Association's tournament; \$500 added. Stanley Baker, Sec'y.

April 25-27.—Kansas City, Mo.—Ninth annual tournament of the Missouri State Amateur Shooting Association, under auspices of Washington Park Gun Club; \$400 added money; target and live birds. Walter F. Bruns, Sec'y.

April 28-29.—Baltimore, Md.—Tournament of Baltimore Shooting Association; targets and live birds; money added. Geo. L. Harrison, Sec'y.

May 2-5.—Lincoln, Neb.—Nebraska State Sportsmen's Association's twenty-third annual tournament, under the auspices of the Capital City Gun Club; six amateur and four open events each day; targets and live birds. R. M. Welch, Sec'y.

May 9-13.—Peoria, Ill.—Illinois State Sportsmen's Association's tournament. C. F. Simmons, Sec'y.

May 16-19.—Erie, Pa.—Ninth annual tournament of the Pennsylvania State Sportsmen's Association, under the auspices of the Reed Hurst Gun Club. F. W. Bacon, Sec'y.

May 16-20.—St. Louis, Mo.—Tournament of the Missouri State Fish and Game Protective Association. H. B. Collins, Sec'y.

May 17-18.—Oil City, Pa.—Interstate Association's tournament, under auspices of Oil City Gun Club. F. S. Bates, Sec'y.

May 23-25.—Algona, Ia.—Tournament of the Iowa State Association for the Protection of Fish and Game. John G. Smith, Pres.

May 24-25.—Greenwood, S. C.—Annual live-bird tournament of the Greenwood Gun Club; 25-bird Southern Handicap. R. G. McCants, Sec'y.

May 30.—Canajoharie, N. Y.—All-day target shoot at Canajoharie, N. Y. Charles Weeks, Sec'y.

May 30-June 2.—Erie, Pa.—Ninth annual tournament of the Pennsylvania State Sportsmen's Association, under the auspices of the Reed Hurst Gun Club. Frank W. Bacon, Sec'y.

June 5-10.—Buffalo, N. Y.—New York State shoot, under the auspices of the Buffalo Audubon Gun Club; \$1,000 guaranteed; over \$2,000 in merchandise, and \$1,000 added money in open events. Chas. Bamberg, Sec'y, 51 Edna Place.

June 6-9.—Sioux City, Pa.—Fifth annual amateur tournament of the Soo Gun Club. E. R. Chapman, Sec'y.

June 7-9.—Columbus, O.—Tournament of the Ohio Trap-Shooters' League, under the auspices of the Sherman Rod and Gun Club. J. C. Porterfield, Sec'y, O. T. S. L.

June 14-15.—Bellows Falls, Vt.—Interstate Association's tournament, under auspices of Bellows Falls Gun Club. C. H. Gibson, Sec'y.

June 14-16.—Cleveland, O.—Cleveland Target Co.'s tournament.

June 20-22.—Wheeling, W. Va.—Third annual tournament of the West Virginia State Sportsmen's Association, under the auspices of the Wheeling Gun Club, Wheeling, W. Va. Ed O. Bower, Sec'y.

July 19-20.—Providence, R. I.—Interstate Association's tournament, under auspices of the Providence Gun Club. R. C. Root, Sec'y.

July 18-20.—Arkansas State Tournament.

Aug. 9-10.—Portland, Me.—Interstate Association's tournament, under auspices of the Portland Gun Club. S. B. Adams, Sec'y.

Sept. 6-7.—Portsmouth, Va.—Tournament of the Interstate Association, under the auspices of the Portsmouth Gun Club. W. N. White, Sec'y.

DRIVERS AND TWISTERS.

The target tournament of the Sportsmen's Association, progresses merrily each day. It is one of the most attractive features of the Garden to the shooters and visitors. There is hardly a moment's cessation in the shooting. Sometimes over 800 targets an hour are thrown—a very rapid rate. The magautrap works very nicely. It is in charge of Mr. Harry Merrifield, who assists in working the trap for the Brooklyn Gun Club. The shooting is done on the west end of the Garden. High board fencing about where the targets and shot fly guard against any falling into the street. On the second day, Mr. R. O. Heikes made a run of 85 in the continuous match, and Mr. J. A. R. Elliott was high in the Association championship at 100 targets, with a score of 98. Shooting did not begin till the afternoon of the first day, and only the Association championship was shot. Mr. J. J. Halliwell was high with 93. On Saturday, in the Association championship, Heikes and Tallman tied on 96 out of 100 shot at. On Monday, in the continuous match, Rolla O. Heikes broke 79 in his longest run; J. A. R. Elliott, 51. In the Association championship, Heikes scored 89 out of 100; Edward Banks 97.

The first annual amateur trap-shooting tournament of the Maryland Sportsmen's Exposition Association, April 18 to 21, inclusive, has \$500 added money, and will be held in conjunction with a general exposition of sportsmen's and athletic goods, a bench show, a field trial, whippet racing, fox hound trials, hurdle contests, beagle trials, fly-casting tournament, poultry show, pet animal exhibit and many other interesting and novel features. In the trap-shooting contests, the professionals can shoot in amateur events for targets only. A set of traps will be provided for the professional events, which are open to all. Mr. Henry A. Brehm is president of the Association; Mr. Stanley Baker, secretary; Mr. H. A. Penrose is vice-president and general manager. Communications addressed to the Maryland Sportsmen's Exposition Association, Carrollton Hotel, Baltimore, Md., will receive prompt and full attention. A large programme, giving complete information will be ready for distribution in a few days.

Ties, miss-and-out: Brunie 0, Otten 0, C. Meyer 1.

WESTERN TRAPS.

Montgomery Ward Badge Shoot.

CHICAGO, Ill., March 4.—The second contest for the Montgomery Ward diamond badge, second series, was brought off yesterday at Watson's, under most unfavorable conditions. The weather was black, cold and gloomy, and rain fell throughout the day. The popularity of these events may be seen in the fact that in spite of such weather a field of twenty-three shooters entered for the event. Nothing seemed to dampen the spirits of the contestants, and the day passed very pleasantly.

The winner of the second contest was Mr. D. O'Brien, of the Douglas Gun Club, who needed only one of his handicap birds in the contest, and who shot out Messrs. Shaw, White, Miller and Willard in the first string of tie birds. Lem Willard won the high average medal, Mr. Kuss won the ties on 14, having to kill 18 birds to win, and Mr. Palmer won the ties on 13. Mr. Nelson, who won the badge in the first contest, got into the ties on 14 this time, but left for town early. Eddie Steck, winner of the first series, to-day got in the 14 hole, and Dr. Shaw landed one above him in the first flight to-day. Out of the total number of twenty-three entries, only five men were placed at scratch—George, Kuss, Barto, Willard and Steck. The winner, Mr. O'Brien, was among the short men, getting the same mark as Dr. Miller, 28yds, and 2 birds, who also killed 15. The wind was fresh and the birds very good. The following are the scores:

W B Leffingwell, 30, 2.....	12112120022020211	-13

Ties on 15: Shaw22022-4 Willard20221-4
White00 Dr Miller21220-4
O'Brien11211-5

Lem Willard won high average medal; Kuss won ties on 14; Palmer won ties on 13.

Eureka Gun Club.

The live-bird series of the Eureka Gun Club continues at Watson's Park, the club meeting to-day at that place being under better weather conditions than prevailed yesterday. Mr. Watson adds the scores.

Highland Park Gun Club Expansion.

The Highland Park Rod and Gun Club, of Highland Park, Ill., has been organized and has purchased a site on the famous waters of Lake Koshkonong, where it will put up a club house this season. The officers and membership of this organization are as below: President, W. B. White; Secretary and Treasurer, D. C. Purdy; Attorney, D. F. Knox. Members—W. J. Obee, George Hessler, C. P. Sullivan, Thomas Morton, Fred Schaefer, Edward Huber, Julius Zimmer, Edward Zimmer, Edward Nolan, W. F. Edwards, Emil Otzel, F. M. Ingalls, Robert Rosenberry, H. I. Morris, Charles H. Baker, H. M. Prior, C. B. Rice, John Rudolph, John Finney, M. McNulty.

Milwaukee League.

Four clubs of Milwaukee—the Jolly Gun Club, Wisconsin, North Side and Milwaukee gun clubs—have organized the Milwaukee Trap-Shooters' League, and held three contests. The Jolly Gun Club has won three shoots straight, the Milwaukee has lost three straight, while Wisconsin and North Side clubs have each won two out of three.

The South Side Gun Club, of Milwaukee, is in flourishing condition, and is spending considerable money on improvements. Everything looks toward a busy year in trap-shooting in Milwaukee. The new club house, on Thirty-second avenue, is a fine one, and has already been open for business. E. Hough.

1200 BOYCE BUILDING, Chicago.

Florists' Gun Club of Philadelphia.

WISSINOMING, Pa., Feb. 28.—The main event, the president's cup contest, at 50 targets, 25 unknown and 25 known angles, resulted in a victory for Mr. Wolstencroft, in the monthly competition of the Florists' Gun Club to-day.

The event was the eighth of a series for the president's trophy. Wolstencroft made his first appearance as a contestant for the prize and scored six points. W. C. Westcott also scored six points in the competition, but his work for the day was not nearly so good. Wolstencroft broke 46 of a possible 50 bluecock targets, while Westcott only succeeded in breaking 31. The competition is governed by a percentage system, and the greatest increase or least decrease over a contestant's previous average entitles him to the greatest number of points.

Howard Ridge did not secure any additional points in the trophy competition, but he broke 45 targets, and carried off second honors on the day's work. A. B. Cartledge broke 39 targets, and Engle was fourth with a total of 38.

Following the club shoot there was a team shoot between two teams captained by W. H. Wolstencroft and Howard Ridge. There were seven men on a team, and each man shot at 25 blue-rocks. Ridge's team won by a score of 121 to 111.

Boston Gun Club.

WELLINGTON, Mass., March 4.—The club added one more shoot to its list of many Wednesday, March 1, at Wellington, and the favorable shooting conditions allowed of some fine practice for the sixteen shooters present. Different degrees of success attended their efforts, but all extracted the same quota of fun, of which trap-shooting affords the very best.

Upon trial, the targets were found a little deceptive; the scores were good, yet not ranging so high as on similar fair days. The clearness of atmosphere made them look too easy when often they were not, as traps were sprung up to give more than an ordinary throw. Nevertheless several averaged well, and the individual and team events were both hotly contested.

Scores as follows:

Events:	1	2	3	4	5	6	7	8	9	10	11	12
Targets:	10	10	3p	10	5	3p	10	10	10	10	5p

ON LONG ISLAND.

Hell Gate Gun Club.

Brooklyn, L. I., Feb. 28.—The Hell Gate Gun Club held their second shoot of the season at Dexter Park, Brooklyn, to-day. Forty-one members and four guests were present. It was an ideal day for good birds. It was clear and cold. A little breeze helped the birds, the scores therefore proving to be very poor, especially toward dark:

New Utrecht Gun Club.

Woodlawn, L. I., March 4.—With wind, rain and smoke in the shooters' faces good scores were impossible at the New Utrecht Gun Club's shoot to-day. J. Gaughen and F. A. Thompson contested for the challenge plate, and Gaughen again won. It seems as if he has a mortgage on the plates. George won the club shoot; his handicap of 3 targets were not needed. He also won the Brush gun shoot, tying with Rasch on 20 targets, and winning the shoot-off by 1 target. Live-bird shoot on Saturday, March 10. The scores:

J. Gaughen.....	11011110101011111010011110—20
F. A. Thompson.....	101100011101110101010001101—17

IN NEW JERSEY.

Trap at Lyndhurst.

Lyndhurst, N. J., Feb. 28.—In the match between Morfev and Baker against Sanders and Packard, the latter won by a score of 36 to 28. They stood at 26yds.; Morfev and Baker at 33yds. Morfev and Baker drew an exceptionally hard lot of birds. Two sweeps were shot. No. 1 at 10 birds, \$5; No. 2 at 5 birds, \$3. The scores:

Morfev, 33.....	202222*2222*22010*21*1212—18
Baker, 28.....	1002*001*2021000120000101—10—28
Sanders, 26.....	0122202201112010112200202—17
Packard, 26.....	21012212021222102*220110—19—36

Sweep No. 1: Morfev, 31, 9; Platt, 26, 7; Baker, 29, 7; Sanders, 27, 7; Packard, 27, 7.

Sweep No. 2: Morfev, 33, 4; Baker, 33, 4; Platt, 26, 4; Sanders, 26, 3; Packard, 26, 3.

Anent Missouri State Tournament Programme.

St. Louis, March 4.—Editor Forest and Stream: I am going to impose upon your time and good nature for the good of the cause.

Will you kindly comment upon the proposed programme of the Missouri State Game and Fish Protective Association, which I outline below. Suggestions from sportsmen throughout the country will be gratefully received.

In commenting upon this programme, it should be borne in mind that this tournament is first of all a Missouri State tournament, held for the express purpose of bringing together the sportsmen of our State, for the interchange of ideas, the discussion of subjects which concern the protection and propagation of our game and fish; also to try their skill with the gun in contests which are conducted in a perfectly fair manner, and of such nature as to bring to the front the nerve, pluck and skill which they may possess in an art which calls in a high degree for just these qualities.

Secondly.—This tournament is open to all. Missouri has no boundaries, except the land that adjoins it.

In the world of trap-shooting, she extends the hand of welcome to sportsmen of other States, guaranteeing to them fair treatment and a good tournament.

Now, here is what we have to offer. Five days of targets and five birds. The equitable or Rose system of division of moneys in target events. Price of targets, 2 cents each. Live birds, 25 cents each.

One hundred and sixty targets per day, for four days, divided into 15 and 20-bird events; five moneys in 15-bird races and six moneys in 20-bird events; entrance, 15 birds, \$1.50; 20 birds, \$2.

To each of these events the St. Louis Shooting Association will add \$30 to the 15-bird events and \$35 to the 20-target events. In addition to this money, there will be a number of medals and other objects of value added to different events throughout the programme. The medals will be donated by individuals and firms in St. Louis.

The E. C. target championship cup will be contested for on one day of the tournament. On that day no regular target events will take place, and no important event in live birds. The E. C. & Schultze Powder Co. have very generously offered the cup to the St. Louis Shooting Association, for contest at this tournament.

This championship at targets calls for endurance as well as skill. Three hundred targets, divided into 100 targets at unknown angles; 100 targets, expert rule; and 50 pairs. The winner of this E. C. cup, under the conditions, will be entitled to call himself the champion of America, at inanimate targets.

In live birds, the great Du Pont Smokeless Powder championship trophy will attract the attention of every sportsman. The next to the last day of the tournament will be the day of this contest. No regular programme events of importance will take place on this day. This live-bird championship will be a handicap shoot, from 26 to 33yds. It will be at 25 birds for \$25, birds extra. The St. Louis Shooting Association guarantees a \$1,000 purse.

The handicap committee will be announced in our programme, and will contain the names of gentlemen from the East as well as the West who are well known as competent judges.

The St. Louis Shooting Association feels very grateful to Messrs. E. I. du Pont de Nemours & Co., for redeeming this trophy and placing it in the hands of our organization for contest.

This is the first time that any State tournament has had the honor of the championship at live birds.

The regular programme for live birds will be: 10-bird events, entrance \$7; \$35 added. 20-bird events, entrance \$15; \$60 added. Enough of these races will be shot to occupy the attention of those who prefer to shoot live birds every day.

On the day of the Du Pont trophy only one 10-bird event will take place, just as a "warm-up."

Division of moneys in live-bird events will be class shooting. Three moneys in 10-bird events, four in 15, and five in 20-bird events.

The regular events for members of the Missouri State Game and Fish Protective Association, such as the team shoot, for four men; the individual championship of Missouri and the interstate championship, will be the same as last year.

Professionals and paid men will be charged an additional entrance fee in target events over amateurs. This money will be divided among the amateurs in some manner. The Association will reward the high averages, so that there will be an incentive to shoot in every event.

In conclusion, allow me to state that the St. Louis Shooting Association, in giving this tournament for the Missouri State Game and Fish Protective Association, is offering to the sportsmen a grand week of shooting—two championship events, and may be three; liberal average money; cheap targets, and a fair division of the money. No man who attends this tournament will go away with a large amount of winnings. But, on the other hand, few can lose very much.

As Mr. Bernard Waters says, tournaments make losers as well as winners, but they ought not to make quitters as well as losers.

We would be glad to have a large attendance. We have accommodations for 200 shooters, and if any one of the sportsmen who have read the above have an idea that they can improve this programme we will be glad to have their views. The programme will be issued about April 20.

Boys, talk up, now; let us hear what you have to say, and then "get your gun" and be in St. Louis on a one and one-third ticket May 15.

HERBERT TAYLOR.

Audubon Gun Club.

BUFFALO, N. Y., March 6.—Following is score of the shoot for Clinton Bidwell challenge trophy, which was shot at Audubon Park Saturday last between E. C. Burkhardt, the present holder of the trophy and C. S. Burkhardt, challenger. The race was a very pretty one, and both shooters showed good form in grassing 23 out of 25. C. S. Burkhardt went straight up to his 19th round, when he drew a towering outgoer from No. 4 trap. Although he hit him hard with the first barrel, he never stopped. His next miss was the 21st round, drawing an easy left-quartering incomer from No. 1 trap. This left the score a tie. Mr. E. C. Burkhardt lost his 2d, a left-quartering incomer, dropping the bird 2yds. back of dead line stone dead. His next miss was in the 9th round, again dropping a right-quartering outgoer dead out of bounds. The tie was shot off miss-and-out, and was won by E. C. Burkhardt, by following score. C. J. Moyer was referee:

Trap score type—Copyright, 1899, by Forest and Stream Pub. Co.

2 2 2	

A. C. Heinold won the Hebard trophy with a score of 30 straight. In the badge shoot, No. 3, on the programme, Heinold had the highest score, but owing to his handicap of 2 birds, was beaten by F. D. Kelsey.

Events Nos. 6 and 7 were at live birds. After the programme events there were two contests at live birds between William McCarthy and E. N. McCarney, and the result was left undecided, each of the contestants scoring 9 out of a possible 10:

Yachting.

As the yachting journal of America, the FOREST AND STREAM is the recognized medium of communication between the maker of yachtsmen's supplies and the yachting public. Its value for advertising has been demonstrated by patrons who have employed its columns continuously for years.

Another Match for Dominion.

Com. H. T. Drake, of the White Bear Y. C., recently sent a challenge to the Royal St. Lawrence Y. C. for a match between the 20-footer Dominion and one of the existing yachts of the White Bear fleet, under the same conditions as the Seawanhaka cup matches, which has been accepted. Dominion will be sailed in exactly the same condition as last season, the races to take place at Dorval about June 12.

The Quincy Cup.

THE Quincy Y. C. is not to have such an easy time in defending its \$500 challenge cup for 21-footers as it did last season. Three well-known racing yachtsmen are after the trophy with full-fledged and up-to-date racing 21-footers, and a smart boat and clever handling, will be needed to keep them from carrying off the trophy.

The latest challenge is that of Walter Abbott, which will come through the Hull-Massachusetts Y. C., and the cup contest will gain additional interest from the fact that the challenge is from a club in practically the same waters as the defending club.

Mr. Abbott is well remembered by yacht-men as last racing the 21-footer Catspaw, in the season of '92, when the class was at its best. Previous to that he had Coyote and others. He has been in New York for the past few years, but is now in business in Boston again, and will renew the racing in which he used to find so much sport. He was formerly a member of the Hull Y. C., and will now take membership in the new organization. The club has not yet formally acted on his proposition to challenge, but there can be no doubt but what it will sanction it.

Purdon will design and Stearns will build Mr. Abbott's new boat, and an improved Recruit may confidently be looked for. With an improved Purdon boat to meet last year's Recruit, it looks as if the Quincy Y. C. would have to get something faster or else suffer defeat. The prospect should stimulate the club's racing spirit, and will undoubtedly have that effect.

Mr. Mower and Mr. Eustis, from the Lynn and Beverly clubs respectively, are also not to be overlooked in the game. The former, in Vitesse, turned out a boat which won her class championship two years in succession, while in Duchess he had undoubtedly the fastest 18-footer in the racing fleet. His new Heiress promises to be as fast as her predecessors, and is clean cut and racer-like in model.

Mr. Eustis is not given to racing slow boats. He has been experimenting for several years, and has worked out several successful designs, his latest being the 17-footer Capelin, which made a fine showing in last season's racing of the Beverly Y. C. in Buzzard's Bay. His new boat may confidently be expected to be fast and able.

The races for the cup promises to be very interesting, and will attract more than local attention.

There was for a while during the last fortnight, the prospect of some friction between the Lynn and Quincy clubs over the latter's revision of the declaration of trust, but the cloud which promised a squall has fortunately blown over and everything is smooth sailing again. The cloud gathered because of the following communication:

Lynn, Feb. 22.—Quincy Y. C.: I have been authorized by the Lynn Y. C. to notify you that the Lynn Y. C. considers that its challenge for the Quincy cup was pending after the Quincy Y. C. received notification of said challenge, and that the Lynn Y. C. considers the action of the Quincy Y. C. in changing the conditions of the races as contrary to its declaration of trust.

F. E. NEWHALL, Sec'y.

To this the Quincy Y. C. cup representative sent the following reply:

Quincy, Feb. 25.—Lynn Y. C.: We have the honor to acknowledge the receipt of your letter of the 22d inst.

We received from you a letter dated Dec. 8, 1898, in which you informed us that your club had voted to challenge for the cup, and also stating that "the challenge will be sent later." On Jan. 24, 1899, we received from you the formal challenge for the cup, dated Jan. 23. On Feb. 23 we forwarded to you our acceptance of this challenge. From Jan. 24 to Feb. 23 the challenge was pending. On Jan. 19, 1899, the revision of the declaration of trust was completed and the instrument was signed by our commodore and secretary. This, you will note, was four days before the date of your challenge. Therefore, we hold that we have not violated the declaration of trust.

QUINCY, Y. C.,

By J. S. Whiting, Representative.

This reply from the Quincy Y. C. has, it is believed, made everything satisfactory to the Lynn Y. C. It has also been made clear to the latter organization that the Quincy Y. C. had no special boat in mind in making the revision barring boats of Dominion type, but simply desired to confine the racing to boats of the usual form. The provision to this end in the declaration of trust says that no point in any section of a boat shall be lower than its midship point. This effectually bars the double-hulled type or any approach to it.

It now appears that R. M. Benner, of the Lynn Y. C., is building an 18-footer with bilges which drop a little below the keel, and which would be barred by the Quincy restriction. He has expectations that his boat will be fast, and hopes that she will be able to beat out Mr. Mower's Heiress in the preliminary racing. In that case she and not Heiress could be named to support the challenge. This was the reason of the Lynn Y. C.'s protest, but assurance has been given that the Quincy Y. C. had no knowledge of Mr. Benner's boat, and had had the restriction in mind for some time before formulating and adopting it.

It is understood that a slight change in Mr. Benner's boat to bring her within the restriction will not be objected to by the Quincy Y. C., and that if he chooses to make it he will have a chance. This amicable settlement of the threatened misunderstanding is a good thing all around.

Mr. Benner's boat is an 18-footer, with an over-all length of 38ft. and a beam of 9ft. 6in. She is a canvas-covered boat, after the style of Duchess and Heiress, and will be very lightly built, and carry a big sail plan. She is being built by her owner at Lynn.—Boston Globe.

Chicago Y. C.

THE annual meeting of Chicago Y. C. was held Feb. 27, and the following officers elected: Com., F. W. Morgan; Vice-Com., George R. Peare; Rear-Com., George Warrington; Sec'y and Treas., Charles H. Thorne; Official Timekeeper, C. D. Peacock; Official Measurer, J. L. Myers; Board of Trustees, William R. Crawford, William Herrick, C. E. Kremer, John D. Berriman and

E. P. Warner; Delegate to Lake Michigan Yacht Association, William R. Crawford.

A syndicate of fifty members was formed to build a trial boat to compete in the international races between Canada and the United States. It is expected that Rochester Y. C. and White Bear Y. C. will also send boats for these trial races. The Chicago boat will probably be designed by Joseph Myers, who designed Blade and Vanenna.

E. H.

The Conversion of Inyoni.

BY COLONEL BARRINGTON BAKER.

From the Yachting Monthly Magazine.

KITE (see the Yachting Monthly Magazine for June) having become too small for me—as is the usual way—I looked around for a larger boat, and the racer Inyoni, among others, was brought to my notice. Of course, I knew (I had to know), for many friends took care to tell me, that she was "a bad sea boat," "her bottom would drop out," "her fin keel would drop off," "she was wild on her helm," "had no accommodation whatever," and "wouldn't suit me at all," etc., etc. I found, by the way, that many of my kind friends confused her with Isolde, and as I also knew that she was semi-composite (steel frames planked with teak), and that she was not a bad sea boat, in spite of her heavy spars, I thought I might make something of her at a reasonable cost, especially as the price asked was very low.

I therefore one day in October went down to see her, armed as usual with rough sketch plans, ready for my figures and remarks, and was surprised to find her in such good condition, seeing that she had no bilge stringer, mast clamps, nor wirings. Her accommodation was nil—an enormous forecabin, a very large main cabin, and a w. c.—greatest headroom under beams being only 5ft. 5½in.! A good bow, but a partially cut-off ugly counter.

Before starting for Cowes, a rough estimate for conversion had been prepared; after inspection it was revised, and she was purchased and sailed round to Plymouth, where, as soon as possible after arrival, she was hauled up high and dry and stripped of all her fittings.

I determined to raise her 10in., carry out her counter and reduce her draft to something under 9ft.

Kite, upon whose alteration I discoursed on a previous occasion, was of "timber" construction, whereas Inyoni, as I have mentioned, was composite; nevertheless, her deck was lifted in exactly the same manner as Kite's had been done. Her steel deck beams had been connected to the frames by eight pairs of steel webs or brackets, cold riveted; the rivets on the upper edge of these webs were easily driven out, and after the deck had been blocked up the gap was in each case filled by steel plate, fastened by bolts and nuts; these were temporarily disconnected at a later date, when fixing the new shelf.

All the steel frames, spaced about 2ft. 10in., were lengthened by steel angles of the same size, fastened to them by ¾in. galvanized steel bolts and nuts; the frames were therefore now double for about 15in. apart in height. The wood frames were also lengthened in a similar manner, each being side-bolted to the existing frame by three steel bolts and nuts. The rake of the stem made it an easy matter to carry that out; but the counter required more thought.

The transom being knocked out, the keel (which really extended from end to end) was carried out about 5ft. The last few frames aft sprung out a little, the new counter being planked in two thicknesses, a third thickness, diagonally placed over the join between the new work and the old; frames being fitted in afterward; in the three upper planks the butts were of course a considerable distance apart, but on the lower portion this could not be done, though they do not form a straight line; being three layers, it formed a very strong piece of work, and is not noticeable. Tracing battens were of course freely used.

An additional steel frame for the after channel plate was also inserted of heavier scantling, and she was then planked up, two strakes of teak in the usual way.

A new shelf, 6in. by 4in., was next worked above the old one, leaving a clear space of 4in. between them; bilge stringers, 8in. by 2½in. red pine, were also added. In lieu of the ¾in. round iron diagonal struts, of which there were five pairs, I put vertical steel angles, connecting beams and frames, and the bulkheads were so planned as to conceal them; heavy diagonal angles, were, however, added to those frames taking the chain plates, and fastened at one end to both deck beam and vertical strut, and at the other to frame and bilge stringer—a very stiff truss. The rudder was unshipped and the rudder tube taken out; there was, properly speaking, no rudder post, though the rudder was hung on the fin in the orthodox manner. A red pine bilge strake, 8½in. by 2½in. was worked the whole length inside.

The saw was run along the top of the lead keel, which was thus disconnected from the body of the boat, the latter having of course been carefully shored up; another cut was then made in the wood fin about 15in. above, and this portion removed. The lead keel had been cast hollow, so a ton more was poured into it, to retain the same stability. The original bolts having been clenched, the lead keel was jacked up to the wooden one, and secured by new additional bolts, driven from inside the boat; these only entered about 9in. into the lead (which was exceedingly hard), apertures having been made just sufficient for a nut to be placed on the bolt, which was then hove up from both ends.

My new accommodation plan entailed shifting the rudder head some 6ft. further aft on deck. A new and longer steel tube was therefore required; chocks were bolted to inside of keel and underside of deck beams for its reception; it was slipped in and fastened with a couple of screws—a simple operation. The rudder stock (iron) lengthened about 2ft., and tiller bent to suit its new position.

A steel fin of ½in. plate was added to the after end of the wooden fin, angles under keel being 4in. by 4in. by ½in., to which it was fastened by 5in. coach screws, the connection to the wood fin being by two pairs of wide steel straps. Teak planks were worked on each side of the after end of the new fin, stiffening it, and making

a post to hang the rudder on; the remainder of the fin was then planked up fair with the rest.

The really weak point in the boat had been the construction of her wood fin-keel; and I fancy that the idea had been, if necessary, to convert it into a plate bulb—or a center plate afterward. This construction was rather curious. For some 25ft. amidships the keel, about 18in. wide, had a double keelson, two steel angles 4in. by 4in. by ½in., worked parallel, with their webs 3in. apart. A slot had been cut through the keel and wood fin between these angles, and vertical 3in. planks inserted, tied by side bolts to keel, keelsons, and fin. The garboards had been padded to reduce the girth measurement, and her designer advised me to remove this, as she might require recaulking there, and explained the construction, which, in my opinion, was hardly good enough for, say, bumping on a sandbank, etc. I therefore decided to strengthen it considerably, by four pairs of heavy steel knees outside (her inside floor framing being exceptionally strong); these knees were about 18in. long in each arm, 3½in. wide, 1¼in. thick in the throat, tapering to about ½in. at each end. They were carefully made to fit to the boat, then fastened in pairs by two 1¼in. steel bolts, riveted through keel and fin, the holes being countersunk; 1in. diagonal each side, through upper edge of keel and steel angle keelson, with nut on top, and a 5/8in. near upper end, through a wood frame (see detail). The garboards were then padded with red pine, in two layers; first to about the space, up and down, occupied by the knees, tapering fore and aft, center portion being 3in. deals worked down. The bottom had of course been tarred, as also iron-work, two coats hot; then a second planking of 1in. laid over all, including the steel fin, tapering in every way to a feather-edge, and finally coppered. It was very fair to the eye, immensely strong, and not unduly expensive.

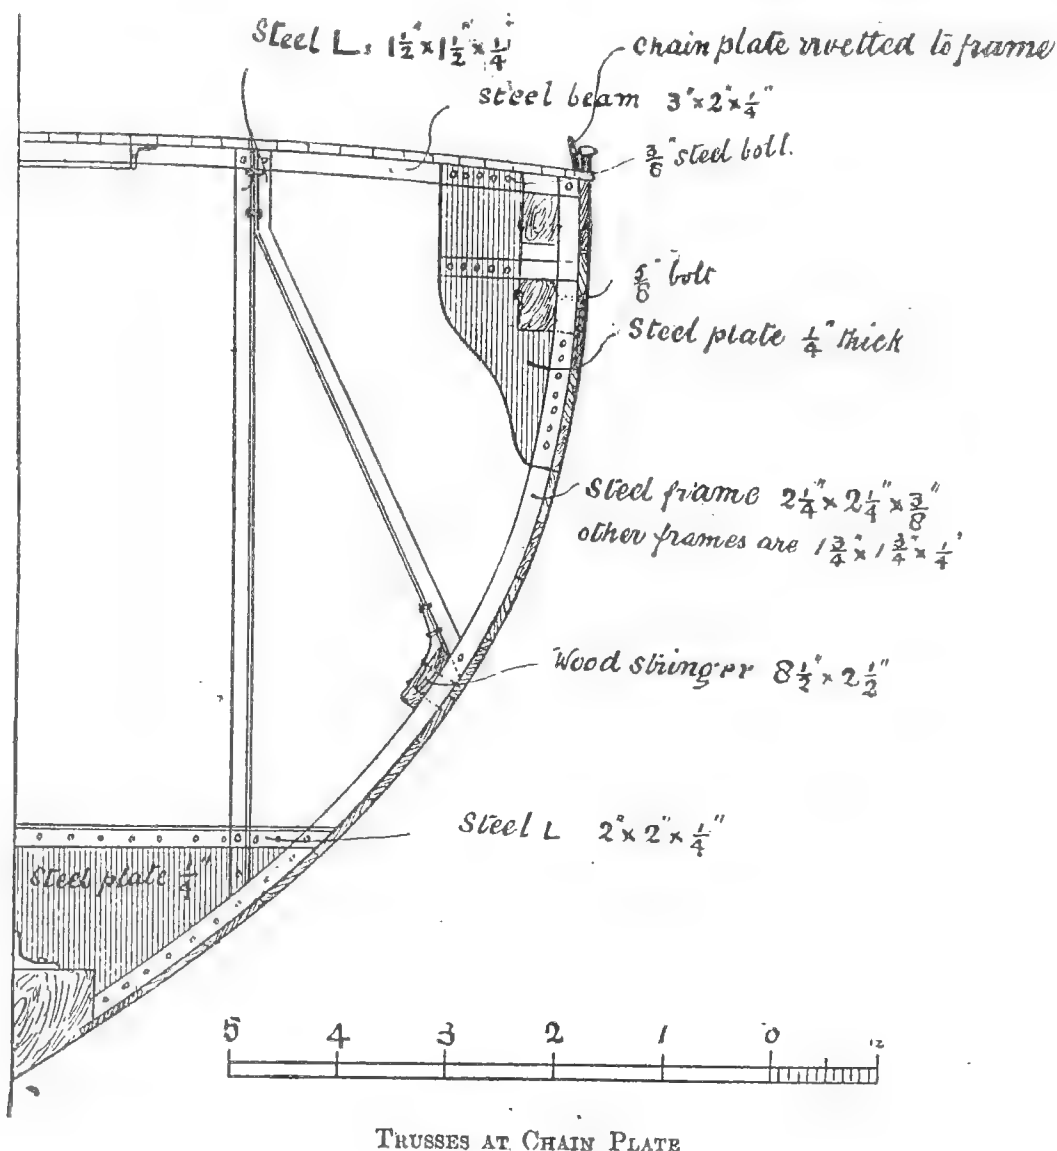

As in Kite, the flare fore and aft caused the waterways to become wider at the ends; this tapering is not noticeable.

The steel webs and struts determined the position of the various bulkheads, and therefore the accommodation. The length of the forecabin was governed by the deep web and trusses on the chainplate frames, which were worked into the bulkheads of the w. c. and pantry, which was 2ft. 9in. fore and aft; the forecabin having three comfortable folding cots, good stove, fresh-water pump, etc., and plenty of room forward for light baggage. The well was originally fitted between two steel beams 4ft. apart; this aperture became the skylight of the after cabin, a duplicate of the main, so that spare panes of glass fitted either. The companion hatch was not so accommodating; the fore end was on a steel beam, with web connection, only 7ft. 9in. from the fore end of the saloon, which would have been very short, besides leaving more than I wanted for the after cabins. I found, however, that the steel beam on which the after end of the companion rested was not so secured; so, taking out the screws which secured it to the deck, I shifted it about 18in. further aft, tied it to the forward beam with steel carlines, and added a half-beam on each side, shifted the companion aft, and ran my saloon bulkhead aft of the web frame, which space is utilized above as a bookcase. There was over 6ft. head room under the beams.

The companion ladder and passage being on the port side, one stateroom was about 10in. narrower than the other; but both were very comfortable, with wide berths, drawers, and a folding lavatory. The ladder formed the door of the after cabin, which was very roomy, the floor being 6ft. wide; a standing berth on each side, with the usual drawers and lockers under, and plenty of hooks, etc. A door aft led into a w. c. lavatory, and hanging cupboard, which was ventilated into the binnacle.

The head sheets lead to the well, and the runner tackles and main sheet are also quite handy. The coaming on deck round the well enables us to have cushions there, and under the seats are lockers for provisions. Under the well is the main water tank, holding 200 gallons; all tanks are filled from deck, and together contain 270 gallons, which we found lasted us twenty-six days.

The sail-room is an immense space, into which all

TRUSSES AT CHAIN PLATE

sorts of things vanish; among others, the big anchor and chain, side lights (on brackets against the well and always trimmed, Cera wax), fenders, side ladder, empty water breakers, spare luggage, awning, etc., etc.

As I thought it possible that the decks might weep a little, although there was no sign of their doing so, I covered them beneath with Lincrusta Walton, and painted it white; the panels in the saloon and cabins were filled with the same material, and look very well; teak-framed panels above, with mirrors, photos, etc., which can be removed and exchanged from time to time.

The gilt stripe troubled me for a long time; it was scored rather deeply in the plank, just below the covering board, and as she had a steel sheer strake, countersunk into the top plank, it would have been rather costly to reduce the width of the plank; and I did not care to reduce its thickness, not only for strength, but for the difficulty of fairing the new work; so, at last, I determined to leave it where it was; and after all, it does not look badly, but rather as if she had high bulwarks. I found it necessary, however, to finish her forward with an incised gilt scroll.

Simultaneously with the conversion of the hull, came that of the spars and sails. The boat was too small, or rather, too short to compete with the new 52-footers; besides, I wanted her as a cruiser. Her mainsail was enormous for a boat under 44ft. l.w.l., being 1,450sq. ft.; the boom being a hollow spar 49ft. long! The mast was also excessively heavy, weighing 1,050lbs.

I cut 2ft. 2in. off the mast, thus reducing the hoist by 3ft. The standing rigging was shortened by exactly 3ft., and of course fitted without any trouble. The diameter of the mast was also reduced by ½in., and even now is none too light. I cut 4ft. from the inner end of the boom, inserted a new plug to take the gooseneck, tapered it a few feet, and put on some new sizings; otherwise made no alterations, except shifting the main sheet blocks further out. It now extended only about 10in. over the taffrail, instead of 10ft., and would be much easier in reefing. Two feet 6in. off outer end of gaff completed my alterations to spars.

[TO BE CONCLUDED.]

Portland Yacht Club.

Editor Forest and Stream:

At the annual meeting of the Portland Y. C., held last Monday, March 1, the following officers were elected: Com., Dr. C. W. Bray, str. Maitland; Vice-Com., L. C. Cummings, str. Cara; Sec'y, James C. Fox; Treas., Carl F. Weber; Meas., D. W. Fox; Board of Trustees, William Senter, James C. Hamlin, Dr. J. W. Bowers; Regatta Committee, W. W. Camp, F. S. Vail, Nathan Clifford, R. W. Miller; House Committee, W. W. Gould, P. I. Jones, J. W. Richardson; Fleet Surgeon, Dr. G. H. Cummings; Fleet Capt., P. I. Jones; Membership Committee, E. H. Rice, E. C. Jones, Dr. W. H. Bradford.

Mr. Weber, the treasurer, reported that he had called in the last of the bonds issued for the purpose of building the present club house, which frees the club from debt, and leaves a good balance in the treasury. Too much praise cannot be bestowed upon Mr. Weber for his efforts to place the club in a good financial condition.

We now have 277 members, a gain of fourteen from last year. Last season there was little interest in yachting as we were thoroughly "bottled up" by the mining of the harbor entrance, but from present indications we will more than make up this season for the lack of interest last year. Several parties are building boats and others are talking of purchasing. The latch-string of the Portland Y. C. is always out, and we hope to see many visiting yachtsmen next summer.

M. D.

Quisetta, schr., has been sold by H. W. Harries to H. F. Lippitt, the former taking the cutter Wasp in part payment. Mr. Lippitt will race Quisetta in the same manner that he raced Wasp for some years past, and will probably make a notable record for her, as she is unquestionably a very fast boat. Capt. Harry Hoff will be in command. It is probable that Wasp will not be raced.

The Polynesian Vessel.

THERE is but one race of primitive man which makes its entrance upon the page of history by way of the sea. Other early races creep over mountain passes and evade the great watercourses by flanking their distant fountains, they fear the great sea, it takes ages before they gain the courage to coast from cape to cape, and always in sight of land. The Polynesian of the South Sea bursts into knowledge with the hazard of deep-water voyaging. In all the families of his race, save one, his story begins with the daring of the Pacific, the greatest ocean of all.

Call the roll of these families and see whence they came and how.

Hawaii? By canoe from Kahiki, which may be Tahiti, certainly is no nearer than the Marquesas.

The Marquesas? From Hawaii, far across the western sea.

Tahiti? From Hawaii in the west.

Rarotonga? From Awaiki, a land in the west and down to leeward.

The Maori of New Zealand? From Hawaiki.

All these families tell of the tempestuous voyages of their ancestors from this mysterious land, of which all retain the name. It was the home of the race in the beginning, it was at that home that they learned to become sailors and ocean adventurers. The only family of the Polynesian race which does not begin in a legend of a dangerous trip across the waters is the Samoan. They believe that the earth was made at their archipelago, that they are themselves the first race of human beings. Ethnologists are agreed on one point, they acknowledge that even if Samoa is not the nest of the Polynesian race, still its largest island, Savaii, is carried in all these traditions as at least the place of the final dispersion of these colonies.

This gives us the shortest and the most direct line in the evolution of naval construction, by it we can judge how primitive man first essayed to build ships, a primitive man who was not afraid of the water. Compared with the brown race of the South Sea, the Tyrian navigators of remote antiquity and the Viking rovers of more recent ages are nothing but longshoremen. We are able to see in the present day what the primitive savage did in remote ages, when he ventured on the sea. The Polynesian vessel

POLYNESIAN CANOE TYPE—HAWAII.

is a type which has been preserved with almost absolute uniformity in all the wandering families of that race, it is the type of what the floating log became when human ingenuity was exerted to fit it for emergencies which arose early in savagery.

As Samoa is acknowledged to be the dispersal center of the Polynesian race, the Samoan type of vessel may not improperly be assumed as containing all the elements of naval architecture as known to the race at the time of the great dispersal, and therefore the most simple development of the early type of vessel. There is just time to catch the Samoan type before it vanishes. Already the boat copied after Caucasian models is displacing the native craft from end to end of the archipelago. Fifteen years ago there were many sailing canoes in Samoa, this year there is but one, and it is drawn up on a remote beach and left to fall into decay, never again to be used. The same change will continue to work, it will not be long before this primitive type of vessel will be but a museum curiosity.

Before proceeding to the consideration of what the Polynesian vessel is, it is needful to make clear one thing which it is not, for great confusion exists on that point. The Polynesian vessel is not a proa or prahu. Where the prahu is found in the Pacific it has been carried by the Malay race or by the Tarapon stock, which has peopled Micronesia, it is a sure proof that the users are not Polynesian people. The Polynesian vessel is the diametric opposite of the prahu, it is everything which the prahu is not. Keep that clearly in mind before passing to study of the details.

The prahu must have these features: 1, bow and stern must be alike; 2, one side must be flat, and that flat side must always be to leeward; 3, the outrigger is always to windward, and exerts a downward force; 4, the mast is fixed at the vertical; 5, the sail is as nearly as possible an equilateral triangle.

The Polynesian vessel differs in these features: 1, bow and stern are on different lines, with a single exception; 2, the lines are symmetrical with respect to the central fore and aft line; 3, the outrigger is designed to act by buoyancy, to exert an upward force, and is absent from sailing canoes; 4, the mast hinges in the step and is never vertical, but always canted forward; 5, the sail is never an equilateral triangle, but a sharp isosceles triangle in which boom and gaff measure the equal sides, while the after leach is about one-third of their length.

Bearing in mind, therefore, that the prahu and the canoe are radically distinct in every particular, let us proceed to the study of the Polynesian vessel, as typified in the naval architecture of the Samoans, whose skill in shipping earned for them at the hands of Bougainville, who discovered them, the title of the Navigators, a name which only now is being removed from the maps.

According to their uses, Samoan vessels are divided into the two classes, such as are propelled by sails, and

such as depend on the paddle for propulsion. The latter again are divided into two classes, the canoe, which is built up of boards and that which is shaped from a single tree trunk. Of these the simplest, and accordingly the most primitive type, is the dugout or periagua type. As such it should receive first consideration.

The essentials of this canoe (Fig. 1) are a hull hollowed out of the trunk of a tree in a single piece, and an outrigger on the port side, which is attached to the hull by a double set of braces, vertical and horizontal. These canoes still abound on every Samoan beach. They are commonly from three to five fathoms long, and seldom vary in the other dimensions with any attempt to preserve a ratio to the length. The beam is approximately 18 in., that is to say, just wide enough for the hips of the paddler, who sits on the outrigger braces, where they cross the hull. The depth is the same as the beam. The space between the hull and the outrigger is less than a fathom, generally between 4 and 5 ft.

The details of the hull are shown in the end view, and show plan in Fig. 2, and the deck plan in Fig. 3. The builder, a select and much respected class in Samoan social conditions, selects from his store of dried logs a trunk that measures the right number of fathoms for the canoe he is about to construct. In the present days

POLYNESIAN CANOE TYPE—SAMOA.

when he can buy civilized utensils of carpentry, his tools are seldom other than a gouge and a plane iron mounted as an adze. Similarly in his own workshop, before the white men introduced metals, he used but the stone adze and the shell gouge, using now as then the coral stems for finishing off rough cuts. Fire was not used by Polynesian carpenters to assist in excavation; yet the Fijians, who have been for ages in constant intercourse with the Samoans and Tongans, were well acquainted with this labor-saving device.

The carpenter invariably begins the shaping of the log at the end which is to form the stern of the canoe and hacks out the inner and outer shape together. When the first rough cutting is done, he begins on the inner hull and cuts that to its final dimensions before touching the outer side. The outer surface is dressed last of all, and it is shaped with respect to the finished inner surface, the thickness of timber being just about 1 in. throughout. All this work is done with neither measurement nor templet, yet each canoe is as like each other as though the same builder had constructed them on exactly the same lines. The cuts will show the form of the hull. The bow is sharp and horned, the keel, while approximately flat, is yet slightly on the rocker type, the run begins at about two-thirds of the length. For some space abaft the bows the hull is left in a solid block, which bears the ornamentation of several small cubes carved in line along the central line of the canoe. These ornaments are frequently decorated with sun-bleached cowry shells.

The builder of this canoe undertakes to turn out a hull that will float in still water, and it is only by repeated experiments of its flotation that he is able to complete his work to his own satisfaction. But no hulls are designed to preserve their equilibrium when carrying weight. That balance is obtained by means of the outrigger. This consists, in the Samoan type, of three essential features.

SAMOAN CANOE—SHEER PLAN.

The first is the outrigger beam, the second the horizontal braces, the third of the system by which the beam is attached to the braces. The beam is a stick about two-thirds of the hull in length, elliptical in section and not more than 6 in. at its widest, cut off square astern and for several feet at the forward end shaved down to a chisel edge in which the bevel is uppermost.

The horizontal braces are light saplings about 2 in. diameter and a fathom long. These are lashed across both gunwales of the hull, one just forward of the beam, the other at a point just above the beginning of the run. The butts of the braces project a handbreadth over the starboard gunwale, their outboard ends to port are joined by a light brace laid over them and lashed into place. All fastenings of the outrigger system are lashings of coir sennit. Between each horizontal outrigger brace and the beam are two rods of hardwood carefully whittled down until they are no more than a finger thick. The upper ends of these rods are lashed to the horizontal braces in such a way that the rods form an angle at the beam. Here they engage in sockets which have been cut for them in the upper surface of the beam. Through a hole in the beam between the sockets for the rods a lashing of sennit is passed and carried over the brace above. This is repeated in as many parts as may seem desirable; it is hauled as taut as possible and then a final strain is put on it by whipping together the two sets of parts. It will be noticed that the whole outrigger system has nowhere an absolutely rigid joint, at each point of attachment there is to be found a lashing instead of a pin; every joint has a certain degree of flexibility. Outriggers have been shorn off by coming in contact with rocks or reef.

They resist all wrenching power of the waves even in the highest gales. The forward end of the outrigger is even with the bow of the canoe; its after end stops short at the after brace.

Before leaving this simplest type of the primitive Polynesian vessel, it may be of interest to show how it has developed among the Hawaiians (Fig. 4). In the course of its wanderings this Polynesian family has lost the clean lines of the bow and stern of the Samoan canoe, both ends are about the same. The outrigger has lost one essential of its system, the vertical supports. In attaching the beam by means of curved braces the Hawaiian canoe makes the system by so much the more rigid, therefore by an equal or possibly greater amount the more exposed to carrying away under wave stress, a danger which is made all the more probable in the Hawaiian canoe by the much greater interspace between hull and outrigger.

This simplest of the Polynesian vessels is a paddle boat. So is its more complex successor. To be sure, a lazy man may hoist a rag on his mooring pole when he finds a slant of wind, which may save him the labor of paddling. But they are not meant for mast and sail and are not ordinarily so used. This very simple dugout, or periagua, is limited by the dimensions of natural timber. Beyond a certain girth the logs increase rapidly in size and weight, and consequently in the difficulty of handling. If it is intended to construct a canoe of more than six fathoms length, the carpenter has resort to another style of building. He keeps the same design and the same lines which he has employed in the periagua, but he builds the vessel of separate planks. These planks he hacks out of solid timber with his adze; they are from 1 to 3 in. thick and vary in exterior shape according to the part of the vessel which they are designed to occupy. Each plank is rimmed by a shoulder 2 in. broad and 2 in. thick. They are set together shoulder to shoulder and then are lashed by coir sennit passed through corresponding holes. The joints are payed with bread-fruit gum, which is practically a perfect resistant in all conditions under which it is to be used. The only other point in which these built canoes differ from the periaguas is that they are frequently decked over bow and stern as far as the outrigger braces.

The sailing canoe marks a different element in construction. It is a catamaran of equal and similar members, which is a double-ender. Each hull is a copy of the

SAMOAN CANOE—BREADTH PLAN.

other, and of the same size. In this type of hull the bow and stern are alike; they are just the same as the run and stern of the paddle canoes. The hulls are always composite, built up of separately hewn planks. The twin hulls are braced by two sets of beams, a set athwartships and a supplementary X-set attached thereto. In each set the beams cross both hulls and are lashed at both gunwales of each as well as at every point where they intersect the other series. The lashing is the same useful coir sennit. This absence of the nail precludes rigidity of the joints. The Samoan builders of catamarans have therefore never encountered the difficulty which has been fatal to a general popularity of the type. No traditions of voyaging recount any such mishaps as the breaking asunder of the vessel. Upon this system of beams between the hulls is erected the light deck with a shed-house for the voyagers. The mast is stepped in the keel of one of the hulls and leans ever forward at a sharp angle. It is crocheted at the head where it engages the gaff of the mat sail. The point of this lateen sail is hauled down to the bow and the sheet and the tack are carried through leaders to the helmsman on the midships deck. In coming about everything is cast adrift, the mast is hauled over toward the other end of the hull, the gaff becomes the boom, the helmsman pokes his steering paddle down through a slot at the other end of the deck and the vessel plays off on the other tack, but keeping always the same hull to windward.

WILLIAM CHURCHILL.

The America Cup.

THE work on the new Morgan yacht has reached a point where everything that is done shows progress, the sternpost and a couple of dozen frames were set up last week, and the remaining frames are going into place rapidly. It has lately become known that some of the sheet steel received at the works is intended for a full set of spars, the first of these, a steel gaff, having been commenced. The mast will be of steel, 21 in. diameter, or 3 in. less than Defender's Oregon pine stick. A set of wood spars will also be provided.

It is stated that the challenger will be 128 ft. over all, 88 ft. l.w.l., and 22 ft. beam, and will be plated with phosphor bronze below water and aluminum above, with a deck of 3-16 bronze, covered with white pine. The parts are got out at Thornycroft's Yard, Chiswick, and taken down the Thames to Blackwall. Capt. Hogarth has selected a crew of thirty.

Coronet, schr., F. S. Pearson, arrived at New York on March 3, from Kingston, Ja., via Charleston, where her owner and friends left her. She left New York on Dec. 6 and has since visited Nassau, Porto Rico and Cuban ports.

Yacht Designing.—XXV.

Marking Instruments.

UNDER this general head may be included:

Pencil.
Pen, Right line.
Lettering.
Ink.
Colors.
Brushes.

The *lead pencil* is too well known to require description; the poorer grades are of little use in drafting, and one make or another of *artists' pencil* should be used; every large dealer in instruments makes an *artists' pencil* under his firm name or a trade name, without attempting to say whether one is better than another, and if so, which is the best; it is sufficient to note that those in doubt will be safe in purchasing the pencils made by A. W. Faber. It is an easy matter to compare by practical use other makes with this one, which has long been considered the standard. The grades of hardness are denoted by letter H, ranging from H to HHHHHH (six H). In some makes the grade runs up to HHHHHHHH, but there is very little work in practical designing for which a harder pencil than HHHHHH is desirable. For calculations and free-hand sketching, grades as soft as HHH, or even HH, are used, but for mechanical drawing the three grades, HHHH, HHHHH, HHHHHH. With the latter a beautifully clean fine line can be drawn, but it is difficult to erase. A HHHH pencil makes a fairly fine line that can be erased without damage to the paper, a very important matter. A good deal depends upon the skill of the draftsman; one accustomed to clean neat work can use a comparatively soft pencil. The rule is for each man to use the softest pencil with which he can make and keep a clean, sharp and well-defined line; a question easily determined by trial of the three grades mentioned.

Pencils are made with movable leads, the wooden shell being hollow and provided with a screw chuck at one and sometimes at each end. These have the advantage of convenience in sharpening and also of preserving the same length and balance; and the latter may be used with a chisel point on one end, and a conical point on the other. At the same time there is an objection in that the leads sometimes slip in the chuck, and in time the chuck becomes loose in the wooden shell.

The *right line*, or *drafting pen*, is one of the most important instruments in the draftsman's outfit. It consists of two blades of tempered steel set in a handle, with some form of adjusting screw by which the distance between the points of the blades may be regulated. One blade is nearly straight and the other somewhat curved, with a space of 1-16 in. to 1/8 in. between them at the middle of the length. The most common adjustment is a screw with a milled head, passing through the curved blade and tapped into the straight blade; by tightening the screw the points may be made to touch, and when loosened they spring apart. In use, the space between the points of the blades is filled with ink, and the *pen* is drawn lightly over the paper with the inner or straight blade in contact with a ruler, such as a straight edge, a spline, or a curve. The ink runs from between the points and is deposited on the paper in a sharp line of any desired width.

In some pens the outer or curved blade is hinged, so that it may be opened to a right angle for cleaning; in others both blades are fixed permanently together, and in cleaning they are simply allowed to spring apart a short distance by removing the binding screw. The latter are less expensive and rather preferable in use, as in the hinged pen there may be a slight side motion of the blades. The points of the blades are sharpened to the shape of a duck's bill, a broad round point to each, ending in a sharp edge. In some pens the blades are made to spring together instead of apart, and the screw is tapped into the curved blade and rests against the straight blade, pushing the two apart. For drawing very broad lines, such as the borders of drawings, a *border pen* with three instead of two blades is used, and for parallel lines, such as railroad tracks, there is the *railroad pen*, a combination of two pens in one handle with an extra adjusting screw for the distance between the pens, as well as the usual screws for the width of the line. The smaller sizes of *pens*, used for fine shading and sectioning, are called *hatching pens*; they are about 4 1/2 in. long, including the handle. The larger *pens* run up to 6 in. long. The greater part of the draftsman's work in ink is done with the plain drafting pen, such as Fig. 62, of 4 1/2 to 5 1/2 in. in length, and with the pen point, similar to this, but without a handle, which is fitted to compasses and beam compasses. At least one plain *pen* is an essential item of the drafting outfit; when thoroughly familiar with it, the draftsman will be able from his personal experience to judge of the merits of various styles of adjusting screws, etc., and of the value for his particular work of such special tools as the *railroad pen*, *curve pen*, etc.

In Fig. 62 the pen has no hinged joint, and the points are so set as to spring together, being separated by the screw, which is tapped through the upper blade and presses against the lower. In the more usual construction the two points are so set as to spring apart, being drawn together by the screw, which is tapped into the lower blade. The upper figure shows the pen set for a very broad line, the lower shows it open for cleaning.

The ordinary steel writing pen is represented in the draftsman's outfit by special fine pens (*crow quill*) for lettering, shading, etc. The *round writing pens*, for the speedy and easy construction of the German text, are very useful in lettering; their use is easily mastered and the *round writing* may be done much more rapidly than the usual ornamental lettering, and yet may be made quite elaborate.

The effort to use ordinary writing ink the right line pen is certain to result in failure, as many a novice can testify; the proper material for this purpose is India ink, a composition of fine lampblack and a glutinous substance, made in China and Japan. While the common writing ink corrodes the pen and soon ruins it, and also

penetrates the paper so that it cannot be erased, the India ink is but slightly corrosive, and lies in a line upon the surface of the paper, being readily erased at will. All qualities of India ink are sold in the stores, some small cakes of choice brands, running up to a high price; but it is not always easy to obtain a satisfactory piece, and the price cannot be relied upon as a sure gauge of the quality. A comparatively small cake will last for many years in ordinary use.

For some purposes colored inks, red, blue, green, etc., are used, these being purchased by the bottle ready mixed. The regular moist or water colors and camels' hair brushes with which they are applied, are used by draftsmen in the finishing of elaborate plans, as in architectural work, but they hardly pertain to yacht designing.

Erasing Instruments.

No matter how much care may be used, it will at times be found necessary to erase ink lines from drawings, and as for the pencil lines, many of these are only put in on the assumption that they will be entirely erased after other lines are redrawn in ink. For pencil lines the common *artists' rubber*, of soft India rubber, is used. There are many variations, both of quality and color. A good rubber will remove the pencil marks without soiling or smudging the surface of the paper; if the rubber soils in time it may be cleaned, or brought to a finer angle, by means of a piece of fine sandpaper. For erasing ink lines a special rubber is made, with fine sand or pumice stone incorporated with the rubber. In addition to this a sharp steel eraser is necessary, though it should be used as sparingly as possible, as it cuts away the surface of the paper and renders it difficult to re-ink. An indispensable appliance in connection with the rubbers is a piece of

Fig. 62—Right Line Pen.

cardboard or sheet metal a couple of inches wide and twice that length, in which are cut several openings of different sizes and shapes, long slits and round holes. This piece is laid over the line to be erased, protecting the adjoining parts of the drawing. By means of it one can erase a line lying close alongside of another.

In the higher branches of their arts, the naval architect and the engineer are materially aided by various elaborate and costly instruments, which record automatically the result of their measurements, and in some cases perform most difficult and complicated calculations. It is only necessary here to mention the principal instruments. The *opisometer* is a simple and inexpensive instrument for measuring the lengths of curved lines; it consists of a wheel which runs on the paper, covering the line, and a dial and hands, the latter operated by gearing from the wheel. The instrument is merely run along the line from point to point, the distance usually in feet and inches, being recorded on the dial.

The *planimeter* is an instrument for measuring the areas of plane surfaces, a tracing point being moved by the hand to follow the bounding lines of the surface and the result, in square inches or other units, being recorded on a cylindrical scale with a vernier. The *integrator* is still more complicated and costly, and in addition to the area of the figure it gives, on three separate dials, the statical moment and the moment of inertia. It is of great value in the calculation of stability and also of the strains to which vessels, girders, etc., are subjected. The *integrator* is a newer and still more complicated instrument for the same purpose, which gives the results in the form of curves drawn by it, instead of in figures. The three instruments are of great value to the naval architect, and of interest to all designers. The *planimeter* is comparatively inexpensive, a good one costing about \$30 in this country. All three are of Swiss invention, and made only in that country. The *integrator* and *integrator* are used by the Navy Department and a few professional designers, but they are practically excluded from general use in the United States by the high tariff and the incidental expenses of importation.

[TO BE CONTINUED.]

YACHTING NEWS NOTES.

Messrs. Tams & Lemoine have placed an order with Lewis Nixon, of the Crescent Shipyard, for a steam yacht of their design for a Boston owner. She will be a full-powered boat, with steel hull and schooner-rigged, designed for a speed of fourteen knots. Her dimensions are: Over all, 166ft.; l.w.l., 148ft.; beam, 23ft.; depth, 13ft. 6in.; draft, 10ft. 6in. She will have Almy boilers.

The annual meeting of the Rhode Island Y. C. was held on Feb. 27, the following officers being elected:

Com., William B. Banigan; Vice-Com., Frank F. Olney; Rear-Com., A. Homer Skinner; Sec'y, A. M. Potter; Treas., E. T. Herrick; Race Committee, Eugene Myrick, Charles G. Easton, J. C. Butterworth, 3d; Fred E. Tattersall, George H. Webb; Committee on Admissions, Ernest L. Fuller, George F. Brownell, George C. Barton, Louis H. Tillinghast, Fred B. Wood, Nathan B. Horton, William F. Boon, Scott C. Burlingame, Samuel Brown; House Committee, Fred E. Field, Ludowick H. Tillinghast, Howard E. Barlow; Potter's Cove Committee, Festus S. Rand, Frank P. Eddy, Charles E. Eddy; Directors, Herbert A. Capron, Frank P. Eddy; Measurers, Clarence H. Green, Fred S. Nock. The membership is 347.

Richard Suydam Palmer, of New York, died on March 2 at Colorado Springs, where he has been for some months. Mr. Palmer had long been threatened with consumption, and last year he became seriously ill while serving aboard the U. S. S. St. Louis as ensign, having volunteered on the outbreak of the war. After returning to New York he was taken to Colorado Springs, where appendicitis developed, necessitating an operation, while he also suffered from tuberculosis, his death being expected for a long time before the end. Mr. Palmer was born in New York in 1868, and graduated from Columbia College in 1889, purchasing the Burgess schooner Marguerite in the same year and racing her for several seasons. He was enamored of a sea life, and spent much time in cruising. After several seasons in Marguerite, he sold her and purchased Tampa, disposing of her in 1898 to the Emperor of Germany. During his ownership of Yampa he made many long cruises to the West Indies, the Baltic and the Mediterranean. Mr. Palmer was a warm friend of the late George A. Stewart, of Boston, and in 1893 he was one of the syndicate which aided Messrs. Stewart & Binney to build the fin keel Puritan for the America Cup races. He was a member of most of the leading social clubs of New York, and of the New York Larchmont and Seawanhaka Yacht Clubs. The body will be brought to New York for interment.

The annual meeting of the New Jersey A. C. Y. C. was held at the club house, Bayonne, on March 1, the following officers being elected: Com., J. O. Thurston, cat Sweetheart; Vice-Com., W. W. Genet, cat Harbinger; Rear-Com., W. E. Pentz, launch Tweeza; Sec'y and Treas., E. R. Grant; Chaplain, H. Meigs, Jr.; Meas., W. E. Wadman; Fleet Surgeon, L. F. Donohue, M. D.; Fleet Capt., W. T. Bernard, cat Drift; Yachting Committee, H. Meigs, Jr., J. O. Thurston and J. Gill. The opening cruise and dinner will be held on June 10, when a cup to be known as the Mission cup will be raced for. Souvenir race day will be on July 1, when three cups will be sailed for. A cup called the Crews' cup was presented and will be raced for on July 22. The Elsworth cup race, which is an annual fixture, will be held on July 29, and on Aug. 19 a cup presented by the commodore will be sailed for.

Wanda, cat, has been sold by E. T. Bedford, to J. R. Suydam, who will race her on Great South Bay.

Iroquois, schr., has been sold by Com. H. C. Rouse, Seawanhaka Cor. Y. C. to W. G. Roelker, of Providence. Com. Rouse has chartered Satanella, steam yacht, formerly Golden Fleece, for the season.

Portia, c. b. cutter, formerly Mignonette, has been sold to A. I. Brush, Williamsburgh Y. C.

The Douglaston Y. C. is likely to profit during the season by its move to a new location, and it has already received a number of applications for membership. The club has secured very desirable premises at Port Washington, 250 by 300 ft., with a house of fourteen rooms. There is a basin 200 by 200 ft., with a depth of 8 ft. at low water, while outside of this is a protected anchorage with 14 ft. of water. The bay is close to the Sound, and easily entered at all times. Port Washington is within one hour of Thirty-fourth street, New York, by the Long Island Railroad, with frequent trains. The club will lay out a three-mile triangle on the bay within view of the club house.

Puritan, schr., has been sold by J. M. Forbes to Com. John O. Show, Jr., Cor. Y. C., of Marblehead. Constellation, schr., has been sold by Bayard Thayer to Francis Skinner, of Boston. Both sales were made by Mr. Crowninshield.

Answers to Correspondents.

PUBLISHERS' DEPARTMENT.

Old Point Comfort, Richmond and Washington.

SIX-DAY TOUR VIA PENNSYLVANIA RAILROAD.

The third of the present series of personally conducted tours to Old Point Comfort, Richmond, and Washington via the Pennsylvania Railroad will leave New York and Philadelphia on Saturday, March 18.

Tickets, including transportation, meals en route in both directions, transfers of passengers and baggage, hotel accommodations at Old Point Comfort, Richmond, and Washington, and carriage ride about Richmond—in fact, every necessary expense for a period of six days—will be sold at rate of \$34 from New York, Brooklyn and Newark; \$32.50 from Trenton; \$31 from Philadelphia, and proportionate rates from other stations.

OLD POINT COMFORT ONLY.

Tickets to Old Point Comfort only, including luncheon on going trip, one and three-fourths days' board at that place, and good to return direct by regular trains within six days, will be sold in connection with this tour at rate of \$15 from New York; \$13.50 from Trenton; \$12.50 from Philadelphia, and proportionate rates from other points.

For itineraries and full information apply to ticket agents; Tourist Agent, 1196 Broadway, New York; 789 Broad street, Newark, N. J.; or Geo. W. Boyd, Assistant General Passenger Agent, Broad Street Station, Philadelphia.—Adv.

The Iver Johnson Sporting Goods Co., 408 Washington street, Boston, Mass., dealers in all kinds of sporting goods, call special attention to the perfection of their \$3.50 target rifle, octagon barrel, rifled true to gauge. Catalogue will be sent free on application.

"The sale of game should be forbidden at all seasons."

—FOREST AND STREAM, Feb. 3, 1894.

CONCERNING AN EPITHET.

THE term "game hog," used as an opprobrious appellation to designate the status of him who, in the opinion of one or more of his fellows, kills more game than he or they deem to be seemly, has come into quite active use. As to the inelegance of it, nothing in the way of comment would serve to make it more apparent than it is. As to its utility, there would be much difficulty in demonstrating that it possesses any. It had its origin at a time when property interests in game were more or less loosely defined, and still more loosely guarded, so far as legal restrictions were concerned. There were those who sought to use contumely as a substitute for legal restriction. The man who killed, in the opinion of some other fellow, more game than he should have killed, was by the latter considered a proper subject for public execration. Many who were zealous in execrating the game hog, so called, were actuated by the best of motives. Many more were open to the suspicion of aiming to check others that they might be the gainers themselves. In any case, the term conveys nothing of a persuasive or convincing nature when used as a text or an expression of contempt. Its use and the intemperate language which many times accompanied it, were much more likely to retard the awakening of public opinion in favor of game protection than to influence it favorably. A code of ethics which seems to serve as a vehicle to carry an elaborate stock of invective, reviling and denunciation, a reflex of the temper and idiosyncrasies of the individual rather than the zeal of a class seeking to establish a good cause, is not one which readily appeals to public favorable consideration. When the term "game hog" is used as a text wherewith to express malice, bitterness and uncharitableness, it is much more likely to prejudice the interests of sportsmen than to benefit them.

The objection may be made that the use of the term "game hog" and the general odium which it brought to the class it was intended to designate, had a beneficent effect in arousing public opinion and in establishing necessary legislation. It is a more reasonable assumption that the ill-tempered arguments retarded both. The gentlemen who took an active lead in game legislation did not present a bill whose substance was denunciation of the "game hog," nor were their arguments conducted on such lines. They showed that such laws were for the general public good.

Much of what is intended as good effort in heaping disgrace on the "game hog" is ill-advised and worse considered. The opinion of one man is a very poor warrant for him to denounce his fellow who holds a contrary opinion. The "holier than thou" premises are not always the best on which to base action. The standards of one man are not necessarily the standards of all other men. The amount of game which one man may kill with perfect propriety at one time and place may be wholly improper at some other time and place. Fifty birds in Mississippi or Louisiana in a day would be far less relatively than five would be in Connecticut. Fifty birds might serve to supply one man with an abundance of game; the same amount might be wholly inadequate for the needs of another. One man might shoot one day in the year and kill one hundred birds; another man might shoot ten days and kill ten birds on each day, so that the sum total which each one took was the same; yet the ten-bird man might feel that he was warranted in denouncing his fellow as a "game hog." A farmer might kill all the game on his own land, and if it was his opinion that he was doing what was right, the repetition of "game hog" ad infinitum would not serve as any argu-

ment in convincing him that he was wrong, though it might arouse a belief that he had reduced to possession what the other fellow wanted. Or, if a man who, after years of effort, should have a great day and actually kill more than was proper, why should all charity be forsaken? Why should so many men feel that he is proper prey for their intemperate denunciation?

Aside from the restrictions imposed by the laws, the amount of game which a man may kill with propriety is largely a matter of personal opinion. Within the legal restrictions, the amount which he may properly kill is an established fact. It then is out of the realm of personal opinion.

The "game hog" is not in the least changed by abuse. If he practice what he believes to be right, abuse rather confirms than changes his convictions. If he knows that he is wrong, abuse engenders a feeling of resentment and defiance. The best doctrine is that of universal good to all. If there are individuals who are harmful in game destruction, let the movement be toward passing the necessary laws and their enforcement. The bandying of names between man and man does harm instead of good. A general movement toward legal restrictions which would be to the good of all is the proper solution of the game problem. Without such general public opinion, there is no tangible standard of guidance. Without public opinion to support it, a law is a dead letter, even if it is a part of the statutes.

SALE OF FISH IN CLOSE TIME.

A PRESS dispatch from Buffalo, N. Y., under date of March 8, reported that Justice Lambert, in the Supreme Court, had rendered a decision declaring that the New York law prohibiting in close season the sale of pike or pickerel caught outside of the State was unconstitutional. And it was added that under this ruling dealers would have the right to handle these species in the close time. The reported decision has of course excited much interest; for it was at once manifest that the principle involved in this particular fish case would apply also to other species of fishes and to game as well. Moreover, the decision as reported was directly opposed to that of the Phelps vs. Racey case in New York, the Magner case in Illinois, the Geer vs. State of Connecticut case in the United States Supreme Court, and other, by all of which precedents the principle has been established that it is within the constitutional province of the State not only to forbid the taking of game and fish at certain times, but to forbid the sale during such periods of fish and game taken within the State or brought into it from other States or from foreign sources. In view of this, it appeared improbable that Justice Lambert would have ventured any such decision as was reported. And he had not.

An action was brought against the Buffalo Fish Company some ten months ago by the Chief Game Protector for the People to recover penalties for the possession of fish in close season. When the defendants served their answer the People demurred to it on the ground that points raised in it were foreign to the allegations in the People's complaint. The decision just rendered is simply an overruling of the demurrer and puts the matter into condition for the People to appeal to the Appellate Division for the purpose of presenting the question raised by the demurrer to that court.

Any declaration, then, that the unconstitutionality of the law forbidding sale in close season has been ruled is premature. More than this, there is no probability of such a decision being rendered. On the contrary, as we have already said, the power of the State to prohibit possession and sale in close season is one of the most firmly established and most widely recognized principles of game protection.

ALASKA, THE ADIRONDACKS AND MAINE.

The possession of liquor is forbidden by law in Alaska. When a Yukon-bound prospector reaches Skagway the customs officer shakes his valise to detect the presence of liquid within, and if the forbidden article is found it is confiscated and the prospector is so harried by threats of delay and other blackmailing devices brought to a high stage of perfection by the Government officials, that he "gives up" whatever sum will satisfy the cormorants and goes on his way rejoicing that he has fared no worse.

And all the while, in the saloons of Skagway, as everywhere else in the Territory, whisky is flowing like water, and the liquor traffic is open, free and boisterous. It is in view of such a condition of affairs that Governor Brady is urging the adoption of a liquor license law for Alaska. A regulated traffic in liquor, he argues, would be preferable to the present unrestricted sale under a law which is not enforced.

The most significant fact contained in the report printed elsewhere of an interview with Adirondack guides concerning the hounding law is that of a change of attitude toward the law by persons who believe in the wisdom of prohibiting the use of hounds, but who declare against a prohibitory statute which does not prohibit and because it does not prohibit. "We believe in forbidding hounds," these men declare, "but open, legalized hounding could not be more destructive than the hounding which is illegal, but as general as hounding before the enactment of the law." This is to say that the Adirondack non-hounding law is a farce, and a law which is a farce is worse than no law at all. The guide who on this ground advocates a law to permit hounding simply adopts for the Adirondacks the argument Governor Brady makes for the Alaska situation.

A third illustration of this demoralizing influence of a law which is not enforced is afforded by Maine, where the summer killing of deer is prohibited in theory, but in practice hosts of deer are killed every summer. The Maine Fish and Game Commissioners acknowledge this, and have proposed as a substitute for prohibition which does not prohibit a license system, whereby summer visitors may purchase the legal right to do what they now do and would continue to do illegally.

In Alaska, the Adirondacks and Maine human nature is all of one piece.

SNAP SHOTS.

Among recent visitors at the FOREST AND STREAM office was Maj. T. G. Dabney, of Mississippi, who, over the familiar signature of Coahoma, has an ever ready word in behalf of the amiable qualities of the snake. The word was spoken this time for the moccasin, which, Maj. Dabney tell us, he has found a most inoffensive serpent, and one which, in repeated experiments and the giving of much provocation, he had failed to induce to strike.

From Quebec comes Com. J. U. Gregory, to whom so many American sportsmen have been indebted in years past for courtesies shown them in their search for Canadian fishing waters and hunting grounds. As an illustration of the growing tendency of shooters and fishermen to take up preserves, Mr. Gregory reports that the Tourili Club, of which he was one of the founders, and which is made up of Canadians and Americans, enjoys possession of a territory which practically is boundless. As we have said, Mr. Gregory has been for a quarter-century making pleasant the way of the sportsman from the United States, and he has done this largely through his lasting relations with the FOREST AND STREAM; and that reminds us of a little angling incident on a Canadian river some thirty years ago. Two anglers, who were entire strangers, were fishing for trout from opposite sides of a pool, when it happened that in casting their lines became entangled, and a momentary embarrassment ensued, quickly to be dissolved, however, when the casts were parted. One of the men was Chas. Hallock; the other was Mr. Gregory. The acquaintance thus begun ripened into friendship, and when, shortly thereafter, Mr. Hallock projected the FOREST AND STREAM he found in Mr. Gregory a warm supporter of the enterprise; and from that accidental tangling of fly-fishing casts on a backwoods stream in Canada came an association which has endured to the present day.

Among the multitudinous attractions New York city has for visitors is the American Museum of Natural History, with its superb collections. We have reason to suspect that the Museum is not so well known as it should be to many who are interested in natural history, and this hint will be acceptable to those who have opportunity to avail themselves of it.

Superintendent Colvin, of the New York State Adirondack Survey, has issued a statement, showing that the holdings of the State within the forest preserve are 1,058,444 acres, while 20,169 acres have been contracted for.

The Sportsman Tourist.

A Trip to Georgia.

BALTIMORE, March 2.—Early in November I was invited by my friend Mr. Pascal N. Strong, of Savannah, to take a cruise in his schooner, and try the fishing in the salt waters of Georgia, near Savannah. I left this city on the A. C. Line train at 2:25 P. M., and arrived in Savannah the next morning, and found my friend waiting for me at the depot. After getting breakfast and making a few arrangements for our cruise, we started for Bieulieu, which was to be our point of departure. We took an electric car, which carried us six miles; then we changed to a tram road, the equipment of which consisted of one car, which was drawn by a mule, and driven by a small boy. When we boarded this car, I noticed a double-barrel gun up by the front door, and a mongrel pointer lying on the floor. After we had proceeded about two miles the boy who was driving, wound up his brake most furiously, bringing the car to such an abrupt stop that half the passengers were thrown from their seats. The conductor rushed through the car in an excited manner, seized the gun, and asked the boy where they were. I could not imagine what was the matter, whether it was an attempt to hold up the car, escaped convicts, or what it was. But my fears were allayed when the conductor with true Southern hospitality handed the gun to my friend and asked him if he would not like to take a shot, at the same time pointing out where a covey of partridges had alighted in the scrub palmettoes. Mr. S. took the gun, got out of the car, the passengers all waiting patiently, and killed one of the birds, which the conductor added to a string of five he had shot on previous trips that day.

We finally arrived at a cross-road, where we left the car, and a short walk brought us to our destination. Here Mr. Strong has established a very large terrapin farm, which is called Bieulieu. The place is beautifully situated on a wide salt-water river, and contains a good many acres. There are several substantial buildings, and the immense "crawl" for the terrapins. Several years ago there was a very large and handsome dwelling house on the place which was occupied by Mr. Strong's family, but unfortunately it was destroyed by fire, with all its contents, the occupants barely escaping with their lives, and my friend, having to make his escape by the aid of a sycamore tree that grew near the house. The crawl was an object of great interest to me, and I never expected to see so many diamond-back terrapins in one place as I did then. The crawl is several hundred feet long, and about 60ft. wide, and contained at the time I saw it about 40,000 terrapins. On the north side there is an incline covered with cement, which leads up to a wide shelf or bench, also covered with cement. On the south side is a wide ditch of mud and water, the tide flowing into it through inlets from the river. The terrapins of all sizes crawl up this incline and lie basking in the sun on the bench. When we entered the inclosure, there were thousands of them upon the bench, nearly all of which on our approach turned tail to get away. But notwithstanding this apparent fear or shyness, they become more or less tame in confinement, and when feeding time comes will crowd like a flock of chickens around the person feeding them.

These terrapins are all grown when placed in the crawl, and are not bred in there, as many suppose. There are, however, some few hatched in the crawl, and after the last severe hurricane that visited the Georgia coast, quite a number of very little fellows were found, not larger than a nickel. The terrapin are purchased from men who make it a business to catch them, which they do in nets from 15 to 25ft. long. They row slowly through the salt creeks, and occasionally rap on the gunwale of the boat with their oars. This noise attracts the terrapin, which stick their heads up to see what is making such a racket. The catcher, who is keeping a sharp lookout, as soon as he sees a head, shoves down in the mud near shore a pole, to which it attached one end of his net. He then rows his boat rapidly in the direction in which his knowledge of the ways of the critter tell him is the right one to catch it, and endeavors to get his net around the space occupied by the terrapin. He then gathers up the net in shore toward the first pole, and generally finds he has entrapped his prey. The terrapin are bought by count, the bottom shell being measured with a notched rule, and all measuring 6in. or over are called "counts." Those of less than 6in. and more than 5 are called three-quarters, and eighteen of them are called a dozen. Those under 5in. and more than 4 are called halves, and two dozen count as one. Those under 4in. are classed as bulls, and command a very much lower price than the larger ones.

Lying out in the stream in front of Bieulieu was the trig schooner Doris, in which we were to take our cruise, and we were not long in going aboard. "Get under way!" was the order given by Capt. Strong, as we stepped upon the deck. We had a spanking breeze, and went skimming along the deep river, through the salt marshes. The first thing I did was to get off my store clothes, and tumble into a flannel shirt and old suit, and then I felt like lounging about the vessel, and enjoying the varied changes of the landscape. These inland waterways of the Georgia coast are wonderful. There is a network of creeks, slews, guts, rivers and bays that would prove a perfect labyrinth to one unacquainted with them. All the coast and Sea Island negroes in this section are fine sailors and pilots, and our crew was no exception. To illustrate, we would be sailing along with a fair breeze in one direction, which seemed to me to lead exactly to where we wanted to go, but suddenly our course would be changed, the vessel brought up into the wind with a tremendous slashing of ropes, hammering of blocks and slapping of canvas, and we would glide into a narrow creek, the vessel's sides almost touching the marsh, and away we would go at a tremendous pace on a course at right angles to the one we had been sailing. On asking Jake, our mate, for an explanation, he would say, "Dis yer crik heads up da," or "dis is a cut-off," but day or night he never failed to find them, nor faltered a moment in his way. But it is not all such plain sailing, for

there are many banks, points and shallows that have to be avoided, all of which were well known to our crew. In fact, most of these negroes know these creeks and rivers just as well as a boy of sixteen knows the streets of the town he was raised in.

We stopped at several places as we went along to try the fishing, but did not have much success. The negroes call these places "fishing draps," they never say fishing. One day we anchored opposite St. Catharines Island, and made arrangements with a coal black fellow named Lewis to drive us across the island to a celebrated fishing place called Bluff Creek Hammock. As it was necessary to make an early start to catch the right tide, we breakfasted at 3:30, and on rowing ashore found Lewis waiting for us. His wagon was an old four-wheeled affair, with every tire tied on with wire, each wheel having a different squeak of its own, and each hub looking as if it had never known what grease was. Pascal (who is generally called Pat for short) and myself sat on a board, that had quite a good spring under it, and Lewis sat on a box to drive. But the funniest part of the whole rig was George, the motive power. He was a cream-colored mule, a little larger than a jack rabbit, but as tough and strong as a steam engine. He trotted along sideways, with one eye on the road and the other on Lewis. The latter was armed with a long supple switch, with which he larruped George the whole time, and every time he brought that switch down on the mule's ribs it sounded like hitting an empty flour barrel, and caused George to jerk back his enormous ears, switch his tail up and show a disposition to let fly his heels. Lewis got out at one place to let down some bars and handed me the lines to drive through. When we were through I tried to stop George to let Lewis get aboard, but stop he would not. Pat and myself both pulled as hard as we could, but the mule walked steadily on, pulling the wagon by the lines. Lewis seeing the situation, yelled out, "Whoa, da, mule, doan' I tole you stop," and the mule stopped as if struck by lightning.

The trail we took across the island led us through the wildest and most beautiful thickets of semi-tropical growth, interspersed with enormous live oaks (festooned with the beautiful Southern moss), magnolias, pines and other trees. The ground was covered with scrub palmettoes, ferns, many beautiful flowers and coquina bushes, with dark green leaves and bright red berries and several varieties of creeping vines. These woods and thickets abound in deer and rattlesnakes, alligators and other varmints. We at last reached the place where Lewis had his boat, and started for Bluff Creek Hammock. This place is at a sharp bend of Bluff Creek, where the tide has eaten away the banks of the hammock, and undermined the trees, which have fallen into the water. The trees soon become encrusted with barnacles and oysters, and sheephead and other fish come here to feed. Such a place is a very trying one to fish in, as the fish when they are hooked make for the stumps and branches, and it is very difficult to keep from getting hung. We had not been fishing long before I was fast to a sheephead, which I knew by his tremendous pull was a large one. Lewis became very much excited, and kept calling out to me, "Gie him up, boss; gie him up." But it was easier to say "gie him up" than to get him up, but a steady, strong strain lifted him free of the snags, and after a fight of five or six minutes I landed him. He was a beauty, and weighed close on 9lbs. We spent four days' fishing at this place and another called McQueen's Hammock, and had magnificent luck, catching 216 fish: sheephead, stag bass, drum and trout.

St. Catharines Island is about eighteen miles long and from two to four miles wide. It is owned by Mr. Raters, of Savannah, who keeps it solely as a game preserve. He has a fine mansion on the island, and entertains the friends whom he invites to share his sport most hospitably. While we were there fishing, he had four gentlemen from Savannah deer shooting with him, and they killed ten deer in the four days. Mr. Raters has bored several artesian wells in different parts of the island, all of which are flowing wells and supply an abundance of fine water to the many head of stock he has grazing, and also to the deer. One well near his house flows a steady stream into a tank in the second story. There are about twenty-four hundred acres of cleared land on this island that formerly produced abundant crops of the finest Sea Island cotton, but now nothing is raised.

As we had had about fishing enough, we continued our cruise to a place called Harris' Neck, which is a tract of many acres, owned and occupied entirely by negroes. Pat expected to get some terrapins at this place, as many of the negroes follow catching them for a living. On arriving we had hardly gotten our anchor down before the "Coota niggers" began coming aboard. They filled the cockpit, and all jabbered at once until Capt. Strong demanded silence and proceeded to business. He has a black man at this place named Grant, who acts as his agent, and who is far above the average negro in shrewdness, but is just as full of superstition as any of them. It is his duty to measure the "cootas" (as the blacks call terrapin), which the catchers bring in bags. Each terrapin as it is brought out is held against a notched measure, and Grant would call out the size to Pat, who would put it down in his book. Grant would hold up a terrapin and say "count," the next one being short of the measure, he would say "three-quarters"; then the fellow who caught it would make a great fuss, wanting to see it measured over again, and trying in every way to stretch it to a count, but Grant was inexorable, and what he said first went. These fellows in the height of the season make from \$15 to \$20 per week.

While at Harris' Neck we heard of some fine lumber that has been picked up adrift after the last hurricane, and Pat concluded to buy some of it, and return to Bieulieu with a deck load. As soon as loaded we got under way, and had a pleasant sail until we entered St. Catharines Sound. Night was fast approaching as we entered the sound, and there were indications of the weather thickening up. Our course was S.W., which we had to hold until we were below a can buoy that marked the outer edge of a large and very shoal bank that ran out several miles from the shore. After passing this buoy our course would have been S.E., and we would

have had a clear run across to Ossibaw Island. The weather continued to thicken, and we were soon in a dense fog, but having held our S.W. course for quite a while, we thought it safe to haul up toward the eastward. We had hardly changed our course before the piping voice of Cleveland, our cabin boy, sang out, "Dat center-bode done drug," and we were hard aground. The swell was coming in pretty lively from the ocean, and on our starboard quarter we could hear it breaking. We got out a kedge anchor and tried to work the vessel off, but could not budge her. Every large swell that came in would lift her, and cause her to pound the bottom. Fortunately the tide was coming in, and we knew that in about an hour she would float. After rolling and pounding for some time, we got her off into deep water and anchored to wait for daylight.

I was particularly struck with the blackness and ignorance of the negroes we were thrown in contact with on our cruise. They have a lingo of their own, and one not accustomed to hear them talk cannot understand them. I asked one of them one day how old a particularly venerable looking ducky was, and he said,

"I can' rightly tole you, boss. When I come here I be chillens, and he be old man."

They say that a Georgia man once made a bet with a Massachusetts man who had not been accustomed to hear these people talk, that the negroes at a town they were approaching talked the Indian and not the English language. To prove it the Georgia man got out of the car and approached an old negro, who was leaning against a post, while the Massachusetts man listened from the car window. The following dialogue then took place, the old negro talking in that deep guttural voice peculiar to so many of them:

Georgia man—Uncle Lish', wha he?

Uncle L.—Wha who?

Georgia man—Epehe.

Uncle L.—Da he.

The Massachusetts man paid the bet, as the language used was as much Indian to him as the genuine thing.

EDWARD A. ROBINSON.

The Alum Bank.

Look, what thy memory can not contain,
Commit to these waste blanks, and thou shalt find
Those children nurs'd, deliver'd from thy brain,
To take a new acquaintance of thy mind.

—Shakespeare: Sonnet 77.

THE Alum Bank was, and is, a steep sloping hillside half a mile or so in length, and 150 or 200ft. high, and crowned through nearly its whole extent with a precipice 25 or 30ft. in height. This slope extends to the edge of the Conemaugh River, and in my boyhood was thickly covered with forest trees. Wild flowers also grew in profusion there, asters, sweet williams, wild honeysuckles, the wake robin or Indian turnip, with its bunch of shining scarlet berries. The cliff on the summit of the hill had crevices and niches in its face, caves, we called them, though none of them was of great size, and in these we sometimes made fires and tried to imagine ourselves the survivors of a shipwrecked crew on some desert coast. I pity the boy of twelve years who has never read "Robinson Crusoe" and "Peter Wilkins," or who, having read them, can ever forget them.

Opposite the Alum Bank the country is generally low, and stretches with a surface more or less broken across the foot of the Chestnut Ridge, two or three miles distant. Through this interval and near the river, the old Pennsylvania Canal dragged its slow length along, where the white-painted freight boats moved on leisurely under the motive power of a solitary crowbait at the end of a long towline, and the more gaudily bedecked packets shot along at the fearful velocity of four or five miles an hour under the impulse of a team of three spanking horses.

The canal has long since fallen into disuse, and few vestiges of its former existence remain. Three or four years ago was dug up in one of the principal streets of Pittsburg, a portion of the forward part of one of the ancient canal boats, and it was an object of a good deal of interest. It must have been buried there for forty years. It was one of the last relics of the raging canawl. Along the further side of the open country and close to the foot of the ridge, now stretch the iron tracks of the great Pennsylvania Railroad. In my early boyhood all that region which now lies exposed to the sun in cultivated fields was a thicket of vines and undergrowth, where were to be found fox grapes, wild plums, and huckleberries, in abundance. Two years ago I wandered over there across the fields, and in a hollow I found a remnant of the ancient thicket, and I gathered a handful of wild plums; but somehow they did not have the flavor of those I gathered in my boyhood. Perhaps the change was in myself.

It was a fair prospect that showed from the top of the Alum Bank. A writer in a newspaper published in a distant town more than two-score of years ago, in speaking of the Alum Bank, says: "This is a bluff of rocks at the Conemaugh River, which ascend about 200ft. perpendicular from the water, from the summit of which a most beautiful view of the country for miles around is afforded. In the distance rolls up in majestic grandeur the summit of the Chestnut ridge, at whose base are situated some of the finest farms in the country, through which winds the Pennsylvania Central Road. The view is delightful, and one would not tire of the scenery in a day. Here in front, through a fertile valley, quietly glide the silvery water of the Conemaugh, along whose margin, as far as sight can reach, are seen waving fields of grain, and dotted on the whole expanse are fine residences and barns." I like this outside testimony to the beauty of one of the favorite haunts of my early years.

For a short distance at the lower end of the Alum Bank the conditions are reversed—the cliff being at the foot of the hill, at the water's edge, while the hill slopes back to the level above. Trees grew on the top of the rocks here, and from their branches one could look almost vertically down into the water, which here formed a wide quiet pool or eddy. Upon some of the larger limbs of one of the greatest of these trees, Master Parker, the teacher of the village school, had laid a slight platform; and here on a Saturday afternoon, when there was "no school," he frequently repaired to shoot the fish in the water beneath.

Often on those same sunny afternoons a group of boys on fishing or swimming intent, have been halted by a voice from aloft—"Don't scare the fish, boys"—and looking up they have beheld Master Parker, gun in hand, on his lofty aerie; and a moment later, when his rifle rang out, there would be a rush of bare-legged boys into the water, each eager to be the first to seize and bear ashore the trophy of the master's skill. I think that few school teachers have been more beloved by his pupils than was Master Parker, notwithstanding his strictness and severity in school. Perhaps but a few hours before the boy who now bore in triumph the fish to the land, had been severely reckoned with by the master for delinquency in the hateful and hated weekly review in arithmetic; but no grudges were kept, and the boys rejoiced in the master's good luck as much as if it had been their own.

Along the top of the Alum Bank and the breadth of only one field distant, was the turnpike, which crossed the distant hills and led to unknown realms beyond. It was a wide, smooth, sandy highway, over which the gaily painted and gilded stage coaches passed and repassed every day, the driver, the envy of the small boy, seated aloft with his long lines and whip in hand. The passing stage coach was a vision of glory. But to what base uses we may come! The railroad put an end to both canal and turnpike. The last of the old stage coaches that I remember to have seen, was in the back yard of one of the citizens, its gilding sadly dimmed and its gay colors faded, where it did duty as a hen coop. On the highest point of the turnpike back of the Alum Bank was a toll-gate, and a small brick house in which the gatekeeper lived. Just opposite the house was a broad field, usually in wheat, and rare blackberries grew along the fences. From this point eastwardly the view took in a wide scope of cultivated country—a garden little less fair than that other which "stretched her line from Aurant eastward to the royal towers of great Seleucia." A few rods to the west where the descending highway made a bend around the shoulder of a bit of woodland, the town came into view on the flat by the river side below.

"Sweet smiling village, loveliest of the lawn!"

How often of an evening have I stood there when silence brooded over the village sleeping in the shadow of Baird's Hill, and contemplated with a full heart the roofs and smoking chimneys of my native place. It was a scene out of Virgil.

Here the turnpike crossed the Conemaugh by a wooden bridge of a single span, which was once the most wonderful structure of the kind in the western country, and which for a generation was the special pride of the worthy townspeople. The bridge was built in 1821, and stood for about sixty years. It was covered and weather-boarded, having a small window on each side, which served little purpose except to show when you were half-way over. It was dark in there, and suggestive of hobgoblins. He was a brave boy that would venture to cross the bridge alone after night. The outside of this bridge was painted in white and yellow, which produced a pleasing effect. I record these petty details, because it remains one of the most vivid of my youthful impressions.

But change has been busily at work everywhere. A railroad now runs along the foot of the Alum Bank, and the despoiling axe has invaded the wooded slope. The musical notes of the boatman's horn and the bugle of the stage driver have given way to the screech of the steam whistle. The pheasant no longer drums from her log in the glade. Master Parker long since fired his last shot from his platform in the tree. The turnpike has been degraded to a township road. The wooden bridge has been supplanted by a modern one of iron. The wheat field is now a thickly populated city of the dead.

T. J. CHAPMAN.

A Brother-in-Law of Antoine.—I.

As Uncle Lisha was rasping with his float at a hidden peg in the toe of a newly tapped boot, his unemployed eyes staring idly out the window caught sight of two approaching figures. They were evidently engaged in earnest conversation, each in turn gesticulating violently, while the other listened intently.

"One of 'em's Ann Twine, but who t'other is, is more'n I know," the old shoemaker soliloquized, while the float went wide of its mark. "He's one o' the same breed, I know, by the motions on him, talkin' wi' his arms as much as he does wi' his mouth. I wonder what the critters du in the dark, or haow they make one on 'em onderstan' when he gits blind. If one on 'em was struck dumb he c'd keep on a-talkin' jest the same. What a tarnal language, anyway."

Then giving the boot a final inner thrust and pitching it aside, "There, I guess that won't hurt more'n tu make Jozeff pick up his quates lively."

Antoine now entered with his companion, a man of his own build and complexion, but younger and dressed completely in Canadian homespun. Uncle Lisha welcomed them with boisterous heartiness.

"Come in, Ann Twine, come in, and come massy vaw. Who's that you've fetched wi' ye?"

"Good mornin', Onc' Lisha. Dis was one mah rel-lishin', one mah beau frere, wat you call mah brudder-law. Hees name Jule La Roche."

"Jule, Jule?" Uncle Lisha repeated. "Why, that's a she name, short for Julia. Haow come one o' yer brother-in-laws tu hev it? Was the' so many on 'em 'at the' wa'n't 'nough men's names tu go 'raound?"

"O, we gat Jules for the mans an' Julie for de womans. Dat better as for de Yankee had Jesse for bosc of it sent Ah'll hear sometam." Antoine retorted and took up the broken thread of his discourse. "Mah brudder-law ant hable for spoke Angleesh, not mos' leetly mite. Ah do' know 'f he ever goin' be hable, lak me."

Antoine continued the introduction in French to his brother-in-law, who grinned affably, while he heroically endured Uncle Lisha's clamp-like grip.

"Hope I see you well? Take a cheer an' set daown," cried the old man, cordially. "Praw gaddy that three-legged one; he tippy ovy toot sweet. Dumb it, Ann Twine, he don't onderstan' French no better 'n he does English. Give him a cheer 'at won't cast him. So he's r'ally one o' your brother-in-laws, hey? Wal, I've wondered more'n a thaousan'-times 'at some on 'em didn't

spill aouten Canerdy oncte in a while, for it must be pooty nigh runnin' over wi' 'em."

"Yas, one udder mans come wid it for week in hayin' can' spik Angleesh no more as he an' he want haire aout, bosc of it, an' he can' haire aout, so he come gat me for haire it aout on some dat big hol' farmer daown to de lake. Udder man on mah haouse wid hees hoss an' cart. He coozin on Ursule."

"So you're goin' to intarpret for 'em, be ye? What you goin' tu make out on t'?"

"Wal, seh, Ah don't know if Ah'll ant haire aout mah-se'f, prob'ly, w'en Ah gat dem feller all haire aout, too. Oh, Onc' Lisha, Ah'll naant never see so fool lak mah brudder-law, me."

"S-s-sh, don't talk so right ty his head! You'll hurt his feelin's ef you don't mad him," Uncle Lisha whispered gustily behind a waxy palm. But his anxiety was at once relieved, not only by Antoine's assurances, but by the grins and nods of the subject of his remarks, bestowed impartially on both speakers.

"O, don' you 'fred, Onc' Lisha. He can' on'stan' Angleesh more as geeses, an' dat was mek it so fool for come on de State, two of it, bosc can' on'stan' Angleesh no more as he talk aour language. Wat s'pose prob'ly dem two fool goin' do 'f he ant fin' me, hein?"

Then he explained in French to his brother-in-law, "I am telling the old shoemaker what beautiful mocassins you make." Whereupon the brother-in-law grinned more complacently and modestly thrust forth a mocassined foot.

"Sem tam he so fool, he sma't lak ev'ryt'ing." Antoine continued, addressing Uncle Lisha. "He mow mos' more as Ah can. He jes' good for all hayin' work, pitch load, ev'ryt'ing, an' he could rip an' bine de grain so you never see to beat it. He could chawp de hwood lak hol' hurrycane. O, all kan' o' work he can do an'

THE QUEBEC HEAD SHOWN AT NEW YORK.

he f'ile lak forty bobolink singin', so you can' kept you fouts on de floor. Oh, bah gosh, Ah'll wisht he gat hees f'ile so you can heard it play. Bah gosh, he can play t'ree four tune all de sem time, yas sch! Oh, Onc' Lisha" (Antoine's face assumed an expression of awed solemnity), "de t'ing he do mos' hardes' was faght. Yas, seh. He mos' more hugly Ah was."

"Shaw, Ann Twine; you don't say so," Uncle Lisha remarked, looking with amused curiosity at the terrible little brother-in-law.

"Yas, he awfly mans. He leek all de mans all 'raoun' where he leewe an' wat he ant leek he scare mos' to deat, an' w'en dey an't no more he scare hese'f, too."

"Scairt hisself? Wal, that is cur'us. Haow come he tu?"

"Wal, seh, dat was de tam he have de wors' faght he ever have. It was be awful, but it was kan' o' funny, an' Ah'll was goin' tol' you dat story. Don't you 'fred, 'cause he can' on'stan' what Ah'll said. I am now telling the old Bostonais what a terrible fighter you are," Antoine said in French to his brother-in-law, who thereat swelled out his chest to its utmost extent and looked exceedingly fierce, as he filled his pipe and savagely smote a flint with a curved steel, showering sparks upon a bit of punk that served him instead of matches for lighting his tobacco. Antoine also lighted his pipe, though with little chance of keeping it in blast if his story should be long, and Uncle Lisha, following his example, settled himself to comfortable attention with his elbows on his knees.

"Wal, den," the former began between explosive puffs, "Ah'll goin' tol' you. You see, up dere in Canada, w'en mah brudder-law leewe on de beeg river, de peop' gat some dey livin' for sol' hwood on stimboat. Oh, dey lot of it go on de river, en' it took lot of hwood for bile hees biler. De peop' sol' dey hwood raght 'long for one dollar 'n half for cord, ev'ry year, ev'ry year 'fore bombye one man want for sol' more hwood as somebody, so he was tol' de stimboat he'll sol' it de hwood for one dollar 'n quarter an' den dat all de stimboat goin' give anybody."

"All de peop' was be pooty mad, but he can' he'p hese'f. Den, after 'noder w'ile, dat feller, Jacque Boulanger hees nem of it, took motion he chawp hwood more cheaper, an' he do it for jes' one dollar, an' den Ah'll tol' you, de peop' was mad, an' oh, haow mah brudder-law he was mad. He say he goin' leek Jacques?"

"Some folks tol' it he can' leek it, 'cause Jacques more as two tam bigger as he was. He tol' 'em wait leetly w'ile, dey see some day w'en he'll gat drunk at Jacques Boulanger, den he leek it, he ant care if he big. Wal, it ant be long, 'fore mah brudder-law have it some wiskey en esprit, an' he ant mix it very weak, an' he took pooty good drink an' he took it pooty often, an' he'll gat drunk at Jacques Boulanger."

"Naow, you see his lan' an' Jacques' lan' stan' close apart, jes' leetly brook run 'tween it in bottom of holler. Jacques' hwood behin' it one side an' mah brudder-law hees hwood on tudder side."

"Mah brudder-law look over de brook, he'll see Jacques walkin' aout wid hees axe for go chawp an' dat mek him some madder so he go aout an' holler some swear at him, an' Jacques hear it an' holler back some swear too."

"Somebody hear bosc of it an' de story go, dat Jule was gat drunk at Jacques, an' was begin for leek it, an' den lot of de folks come for see de faght, but all stan' back so not for get hurt, bosc side de holler behin' Jule an' Jacques, an' dey was 'baout twenty rod one nudder, prob'ly."

"Den mah brudder-law holler some more laouder an' Jacques holler back more laouder too, an' de echo behin' bosc of it holler, too, so if dey was ten mans on de hwood. Den mah brudder-law trow hees cap an' jomp on it awful fugly, an' Jacques, he paoun' hees breas' of it wid hees fis' an' say he big man, more strong anybody."

"Den mah brudder-law call him dam hol' hog an' jack asses an' betc puate, dat's skunk, an' great many kan' o' t'ing an' haow easy he can leek it."

"Den dat Jacques pull off some hees hairs an' say he can heat mah brudder-law, an' den mah brudder-law lif' hese'f by hees traowser an' holler, 'Brooo,' an' echo come back, 'Brooo,' pooty hugly, Ah tol' you, raght behin' Jacques so de peop' begin for be scare some, an' Jacques, too."

"Den mah brudder-law drink big drink off hees bottle an' gat more drunker at Jacques, an' more madder at it, an' he hopen hees maout' for mek de wors' holler he'll make yet. Bah gosh he hopen it so wide de folks behin' see it comin' raoun' hees head of it an' tink it goin' for crack off, an' w'en Jacques see it raght biffore, he t'ink prob'ly mah brudder-law goin' for swaller it, an' he start for run, an' w'en de peop' over dar see dat big Jacques run dey t'ink it 'baout tain for go, too."

"Den mah brudder-law mek so awfly roar you never hear. Oh, it shake all de hwood for mile, an' w'en de echo come back more laouder an' more of it 'Brrooo, brooo, broooo,' mah brudder-law t'ink de dev' an' forty louns gareau comin' aout de hwood at him, so he'll jes' turn hese'f raght raoun' an' run fas' he can 'cause he ant come dar for faght all dat hell t'ing, honly jes' man, he gat leek already."

"Naow de peop' behin' it, see he'll runnin', dey knew it was danger for dem an' dey'll ant wait for see no more, but jes' run so dey never was afore. An' one hwoman she faint 'way off so dey mos' can' brought it back. So you see it was pooty scary tam."

"Wal, seh, mah brudder-law ant run great way 'fore soon he slip hees foot an' tumble, flop, right in leetly holler full of leaves, an' he ant hear no more nowse, so he ant want for got up. Mebby he can' prob'ly, so he jes' lay still an' go sleep all de res' dat day."

"Dat big Jacques Boulanger, he fall too, w'en he runnin', an' chawp hese'f on hees axe so he can' chawp no more hwood for tree mont', an' dat broke up de cheap chawpin', so de peop' got dollar 'n half for cord ag'in, an' I tol' you dey was t'ink plenty of my brudder-law. Ant you t'ink he'll do grea' deal good for jes' leek one man so hard, hein?"

"Sartainly," said Uncle Lisha. "Sartainly, and at the same time not hurt no one."

"Wal, naow," said Antoine, after getting his neglected pipe in full blast, "I'll goin' took mah brudder-law down on de village, for show it de Forge. He'll ant never see it w'en it goin'. They ant gat it where he live."

So the two departed, mingling the odor of their rank tobacco with the sweet scent of the blooming clover, and their gabble with the voices of the rejoicing bobolinks.

ROWLAND E. ROBINSON.

Natural History.

The Quebec "Elk."

NEW YORK, March 8.—*Editor Forest and Stream:* The supposed elk killed on a tributary of the Metapedia River in Bonaventure county, Province of Quebec, turns out, as stated in last week's FOREST AND STREAM, to be a caribou.

Mr. L. Z. Joncas, Chief of the Department of Lands, Forests and Game, of the Province, tells me that this animal was killed by one Alfred Blair, who wrote to him, saying that he had killed an elk. Mr. Joncas, knowing, of course, that elk are not found in that section of Canada, wrote Blair, telling him to send on the specimen to Quebec, and saying that if it proved to be an elk he would give him a high price for it. It was a caribou, and its head was pointed out to me by Mr. Joncas this week at the Madison Square Garden, hanging on the west side of the westernmost Quebec cabin, about half-way back from the aisle. It must not be confounded with the caribou head hanging higher up at the southwest corner of the same cabin, which carries remarkably flattened horns.

The three elk heads from the neighborhood of Lake Victoria, P. Q., naturally attracted my attention. The smallest of the three hanging on the east side of the more westerly of the two Quebec cabins, has nothing specially characteristic about it. But the other two, one of which hung high up in the space between the two Quebec cabins, and the other on the easterly front of the easternmost cabin, were remarkable for the stoutness of their antlers compared with the length. Moreover, on each of these two heads, the antlers do not show nearly so wide in the spread, as is common in the average Western elk. On the other hand, I have seen Western specimens which did not differ markedly in these two respects from the two largest Quebec heads.

The color of the head and neck of the largest head, which was the one hanging between the two cabins, is,

however, worth noting. The usual color of the head, throat and foreneck of the elk is a dark wood brown, growing lighter on the nape and back of the neck. But the specimen in question appears, seen from a distance, much darker and of quite a different shade from any elk head that I have seen. It is a very dark brown, but with a distinct shade of red in it; a color quite different from the tinge of yellow which marks the usual elk head and neck, and which in fact was seen on the two other heads from the same locality. On the whole, this head gave one the impression of being quite unusual.

GEORGE BIRD GRINNELL.

Domesticating Wildfowl.

BY FRED MATHER.

THE term "wildfowl" is restricted by sportsmen to web-footed water fowl, and is never applied to any other bird or birds, not even to the waders, and in this sense only will the term be used here.

When man domesticated the mallard and the muscovy duck of tropical America he stopped because he had breeds which gave him all the meat he could expect from ducks. He then began to encourage "sports," as odd specimens are termed, and produced the white ducks, some with top-knots and the dwarf "call ducks." He tamed the black duck occasionally, but as it was no improvement on the mallard, he seldom bred it in a pure state. Within the last quarter of a century he has bred the so-called "Cayuga black duck," which he falsely claims are an improved black duck bred from wild stock caught on Cayuga Lake, N. Y. These "Cayuga" ducks are fine large birds, but will not become popular with market breeders because of black pinfeathers, which disfigure them when dressed. But, these alleged descendants from wild black ducks show mallard blood in the greenish heads of the drakes; and that inevitable badge of mallard blood, two curly feathers near the tail. The black drake has no green in its head and no other drake but the mallard has those curled feathers.

With these birds the maximum of duck meat was attained and all other experiments have been made by men who either loved to have beautiful, if not profitable, birds about him, or by some sportsman who loved the companionship of the fowl which he seldom saw alive at close quarters. Perhaps it was a little of both sentiments which induced me to spend time and money to try to domesticate such of our wildfowl as could be obtained, with no questions asked about the game laws of the States they came from nor how the specimens were procured. I wanted the fowl for a good and righteous purpose, and "the end justified the means."

Geese.

Greene Smith, long since dead, had the greatest collection of mounted birds in any private collection in America. I don't know where it is now, but it was offered to the Smithsonian Institution as a gift, on condition of its being kept together and known as the "Greene Smith Collection." It was declined because the authorities had no idea of its extent, but when they learned what this man had accumulated at an enormous expense, they reconsidered the decision; but too late, the collection went elsewhere.

I was fishing with Smith one day when my wildfowl were mentioned, and he told me that he was closing out his live stock, giving it away, and if I would accept his geese he would be glad to give me them. He sent me ten Canada geese, six snow geese, nine white-fronted geese, four blue geese and three black brant. Here was a wealth of geese, which was beyond my dreams of avarice. In my poor way it would have taken years to get these birds, not to speak of dollars.

Be it known to all men that the common names of these geese, as used above, are unknown to many gunners who shoot these birds, especially west of the Mississippi River. There they know but one "goose," the Canada "honker," all other geese they call "brant." For instance, the snow goose is "white brant"; the white-fronted goose, with the white strip across its forehead, is "speckle belly," or "speckled brant," from its variegated breast; the blue goose is "blue brant," while the only bird called "brant" by gunners on the Atlantic coast is the "black brant" of the West. So much for names.

A Digression.

In place of a foot-note, which is an abominable thing, both to writer and reader, I wish to ask for information about Greene Smith. If enough of this can be had, with photograph, he will go in with "Men I Have Fished With," for while I only knew him slightly and fished with him one day only, years ago, I know little of him except that he was a son of Gerritt Smith, the famous Abolitionist, who did not approve his son's sportsman's tastes. We had a pile of fun on a fishing trip, but the fact that I only knew the man slightly was the reason for not including him in the list. He is dead; his cousin, Charley Baccus, the minstrel, is dead, and all the Fitzhughs of Michigan and Virginia, who were cousins, are dead, so far as I know, but some living men can tell me something of the man; just enough to show who and what his great work was, and leave the fishing story to me. As a raconteur, he could discount Baccus, and was up to the standard of Amos Cummings, Polk Miller and the late "Billy" Florence.

Domesticated Geese.

The origin of our common tame white and gray geese is involved in obscurity, there is no known wild species which resembles them enough to be assigned as the progenitor of our domestic bird.

If guessing were allowable, I would guess that the white-fronted goose or "speckle belly," *Anser albifrons*, was the parent bird, basing the guess on shape, carriage, habits and voice, as I have observed the bird in confinement. The change in plumage is what has come to all domesticated birds, there are even white turkeys and guinea fowls, as short a time as they have been tamed. Then there are the great China and Poland geese, with knobs on their bills, yet no more strange than top-knots on ducks.

The Canada goose is not the parent of our tame bird,

for the "honker" is nearer to the swans than the geese, and while it will cross with our tame goose, the product is a mule. Large numbers of these mongrel geese are bred for market, making fine large tender birds. The Canada goose has been domesticated, and by this is meant unrestricted freedom without wing clipping or a desire to migrate.

The brant, "black brant" of the West, has not been domesticated. It has been held in captivity with a range of grass and water for ten years, and has not laid an egg in our latitudes. This is the goose that the arctic explorers always saw going north, and on which the theory of an open polar sea was based. Up to some twenty years or so ago it was said that no man had ever been far enough north to find the nest of this bird, but I have an impression that a few have been found in late years.

The blue goose was once thought to be the young of the snow goose in immature plumage, but is now known to be distinct. These birds become "blue brant" and "white brant" in the West, where, as has been said, there is only one "goose." Neither of these birds have been bred in captivity, as far as I know, and I had them in my grounds at Honeoye Falls, N. Y., for three years, and gave them to the Philadelphia Zoo and to Central Park in 1875, where they may be yet. Mr. T. Treadwell, East Williston, N. Y., has had them for ten years without getting an egg from one.

The Egyptian goose is a small bird, the shapeliest of all geese, and is most beautifully parti-colored; it is to the geese what the wood duck is among ducks. It is seen at our poultry shows as a curiosity, but is not common in America; it is said to have been bred in England.

The Ducks.

Leaving out the three sheldrakes, Jordan records thirty species of ducks, "in the district north and east of the Ozark Mountains, south of the Laurentian Hills, north of the southern boundary of Virginia, and east of the Missouri River, inclusive of marine species." This from his "Manual of Vertebrates."

Discarding all the "old squaws," "sea coots," whistlers and other birds, which cannot be confined to a diet of grain, vegetable and such animal food as our tame ducks get, there are ten American ducks well worthy of domestication and of keeping pure, by one who loves to have such things about him. Few know how beautiful a living wood duck or teal is, or how one gets to love them and have them about. What if a green-winged teal, the smallest of all ducks, is no larger than a pigeon; the question is not one of meat as it was with primitive man when he domesticated the mallard. I have spent more dollars than I could well afford on this fancy, and if wealthy would prefer it as a "fad" to any other. A few surplus birds were sold, but not enough to pay for many wild birds which came dead, when the only thing being left was the express charges. Then there was food, loss by minks and other vermin; but I never faltered. When I was forced from my home in the country by a contemptible politician, who did not know that a canvassack in evening dress was a bit better than a clam chowder in shirt sleeves, my pets had to find other quarters. All my work in this line was broken up, and it is well worth while for some man to take it up and carry it on. The fact is that I did it *con amore*; but really could not afford to carry out the work as it should be done; see my remarks on canvassack ducks below.

Pinioning Wild Birds.

When you get a wild bird never clip a wing, unless as a preliminary to pinioning shortly after. When you cut the stiff quills of the primaries, they will split in time and become like "hang nails" on a human hand; they split up into the flesh and become sore, and do not shed, sometimes causing blood poisoning. If they shed and new feathers grow, the bird must be caught and clipped twice a year, with a chance of its escape.

A bird once pinioned needs no more attention and is prevented from flying while it lives. Only one wing must be pinioned so that an attempt to fly turns it over on the ground. Lay the bird on its back, wrap a towel about one

wing and the body, leaving the other free. Have your assistant, who holds the bird, press his thumb on the main artery where he feels the pulse, at the point marked P in the illustration. Pluck the fine feathers between the joint A and the line C, and also four of the secondary feathers whose quills come in the line of the proposed cut, B. Never unjoint the wing at A; it leaves a large knuckle which will continually get bruised and sore. No surgeon would amputate a leg or an arm at a joint.

Having bared the part of feathers, make a cut on the line B, from close to the junction of the little thumb E, to the wing. If you cut on the line C, there will be several secondary feathers left, and birds so pinioned can often fly over a fence and for some distance. There is merely a skin over the two bones on the line B, and but a trifling cut need be made. Then with a stout knife cut the bones, taking care not to cut the skin back of them. Turn up the ends of the bones; skin back to the dotted line D, thus leaving a flap to turn over the amputation. Stitch this flap over the wound with three or four stitches of sewing silk, no cotton; bend down the little thumb with the silk so that the scar will always be protected, and let the bird go.

Properly performed there should be no loss of blood, to speak of, and the wound will heal in three days. I once pinioned twelve ducks inside an hour, and if they had been handed me without delay, I could have easily made the number fifteen. Care must be taken that no bone pro-

trudes or the wound will never heal. I have brought pinioned birds with protruding bones, where some thoughtless fellow had merely chopped the wing off with a hatchet. Such birds are always poor and will never breed. Of course, I amputated the wing above the joint A, and made a clean job and a healthy bird.

With young birds, at six or eight weeks old, or as soon as the pinfeathers start, all that is necessary is a pair of sharp scissors to clip the line B, leaving the thumb.

Ankylosis.

Now I am not a surgeon, if what is written here has a flavor of the scalped; but by the way, I own a set of dissecting instruments, picked up in a Bowery pawn shop for a trifle many years ago, when I began to study the anatomy of fishes, and found that some knowledge of all vertebrates was needed. Then, to work out those pharyngeal teeth which cyprinoid fishes carry in their throats, and by which the scientific differs separate them from others which are outwardly like them, I had to learn to use a watchmaker's glass and hold it in one eye, while with a toothbrush in one hand and a bone in the other, a few faint teeth were brought to light before the double-jointed name of a 3in. fish could be recorded. That's ichthyology; but that eye glass is used constantly on slivers and other things; couldn't keep house without one.

If the boys on the back seats don't know what ankylosis may be, let some body tell them that it is merely a Greek term used in pathology for a stiff joint. Our joints must be used or they protest, as we see when we have been "cramped up" in a car or coach all day. Keep an elbow or knee in a fixed position for three months, more or less, and it is no longer a joint, the disease known as ankylosis has set in, and there you are.

When a bird is pinioned, the mutilation is plainly shown when it stretches its wings for exercise of its joints, but when the wings are closed, only a careful observer would note that the primaries of only one wing reached above the back. I would not now pinion a bird larger than a mallard; because the bones are large, the birds are heavy, and there is a better way to do it, so that when at rest, the birds are perfect, and only when they stretch their wings is there any evidence that they are not symmetrical.

This plan is best for geese, pelicans, sandhill cranes, swans and other large birds. The tools are fine soft copper wire and an awl of proper size.

Have an attendant, or two to hold the bird, which must be blindfolded. Draw the wing back at the joint marked A in the cut; drill holes in several of the primaries and secondaries, marked 1 and 2; put the wires through in several places so as to keep that joint from moving; fasten the wires and the job is done.

The joint will become ankylosed before the next moult, the feathers will be shed, but that wing can never be extended for flight, yet the bird is perfect. We occasionally meet men with stiffened joints, caused by improper treatment, but there is no suffering after the first few days of so confining a joint, nature cares for that, and while this treatment is best for large birds, I am not sure but it would be best for smaller ones.

The Teals.

Of the cinnamon teal I know nothing, but have owned and bred both the blue-wing and the green-wing. If there is a wild duck that inherits less fear of man than these two teal I don't know it. Of the two perhaps the slightly larger blue-wing is quickest to make friends with man, but here is a story of the green-wing.

At the New York fish hatching station at Cold Spring Harbor, Long Island, I had a fair collection of my pets. There was a long, no-account pond made by throwing up a highway, and in this the tide rose and fell. A picket fence on one side and poultry netting on the other, held a few ducks, some green-wing teal among them. Every day, and several times a day, I took them water cress, duck weed, lettuce, cabbage, or other delicacies, in addition to their grain and animal food, and always talked to the birds as they fed. Talking is a most important thing in the domestication of wildfowl, as it is in the training of domestic animals. The talk was always the same: "Hello, little birds; I never did see such pretty little birds; come up here now and get some good things." There was no thought that the words would be understood, but there was finally a distinct connection between them and the feeding that when the corduroy working coat was left off and a morning trip to the city in frock coat and "nail-keg" hat was in order, the flock would follow me when I was outside the picket fence if I saluted them with: "Hello, little birds," etc.

May came, and the flock was short one female green-wing. With an anathema on all minks and weasels, there was work to be done in the hatchery, and the little teal was forgotten until one morning she appeared on the pond with four fluffy little balls of down, about as big as a piece of soap after a hard day's washing. They could swim well, and had implicit confidence in their mother, who evidently thought them young teal, but they could have taken refuge in a .10 bore gun with room to spare. I called the men from the hatchery, and we netted the family out. Mr. Teal was off conviving with friends, and paid no attention to the raid on his family; but, Mrs. Teal, when captured, looked up at me and remarked: "Quack, quack," and was answered in the same language. This was satisfactory, and when she was put in a special pool with her young, she seemed to realize that man was not only her friend, but the friend of all that she held most dear, and would, mother-like, give her life for.

As the blue-wing teal is the easiest to approach of all wild ducks, so their young are naturally tame. I would much like a chance to try the effect of keeping the young of both these teal without pinioning, as has been done with mallards.

Wood Ducks.

I have bred more of these beauties than any other duck. When I began the work they were the only wild duck that I could get in quantity. They were netted in great numbers in Michigan for market, and as I would pay several times the market price, I bought large numbers, and helped stock zoological gardens in Europe. In the late 60s and early 70s not one bird in ten would lay eggs for me, but I raised a few. Then when I left Honeoye Falls,

N. Y., in 1876, the flock had to be disposed of. From that time until 1883 I had no country home, where my pet fancy could be resumed. Then these birds were scarce, the once prolific Michigan lakes where Northern-bred birds stopped to feed on their way South in early fall no longer paid the netters, but I got a few.

Let some one should rise and accuse me of aiding and abetting the netters, and so being responsible for the diminished number of wood ducks, let me say: The game laws of Michigan and Iowa, where I got some birds later, were not then so strict or as well enforced as now. The netters would have netted the ducks for market just the same, getting 50 cents a pair for the birds; and my standing offer of three times that figure more than paid them to keep them alive, box and deliver them to the express. Then, my aim was a grand one; to try to domesticate this beautiful bird, and as before said, the end justified the means. If I needed birds for this purpose now I would not hesitate to employ men to get me a dozen pairs and ask no questions, but it is not necessary to do this if one wants wood ducks, for many men are breeding, but not domesticating them.

I doubt if this bird can ever be domesticated. I learned how to breed them with certainty, but after being bred for ten generations in confinement, they would escape, if possible, and never return. They distrust man after he once catches them to pinion them, when a few weeks old. They have been so tame as to run to meet me with a dish of bread and milk, or other food, and climb into it and feed greedily until once taken in hand. Then they became suspicious. No bird likes to be taken in hand. The stiff quills must hurt when pressed into the flesh. Pigeon men handle their birds by a grip on the wings close to the body, ducks should be so handled. Domestic hens may be handled by the legs. The man who takes a duck by the legs will have a crippled bird that must be killed, for their legs are weak and all attempts to heal a broken leg by splints or plaster bandages, by me, have been failures, but then it is recorded that I am not a surgeon.

On a later trial of breeding these birds, there was a train of thought something like this: In nature every female breeds; with me it has been only one in ten, the climate is right, for they breed here; the trouble must be in the food. In western New York I have fed corn, wheat, rye and oats, with such vegetation as lettuce, purslane, "pusley," young cabbage, water cress and duck weed, all of which they were very fond, yet they laid their eggs sparingly. Evidently something was lacking, and then the fact that they had been seen to pick insects from overhanging leaves, eat frog spawn and gobble up pollywogs and snails as well as small frogs, suggested that what was needed to round out their natural diet was animal food. When the new ration was issued in the next February, there was rejoicing in April and May, when every pair of wood ducks began nesting.

The Hollow Tree Nesters.

All the wildfowl of my acquaintance nest on the ground, with the following exceptions; some "tree ducks" of Central and South America, wood ducks, Chinese Mandarins and the pretty little "hooded merganser," also called "little saw bill." If the other mergansers, or "Sheldrakes," nest in trees, I do not know, but suspect them of it.

The ducks which nest on the ground may be left to their own devices, if you give them a chance for seclusion, but for those which nest in hollow trees, we must provide natural conditions. Take a box 12 in. high by 7 in. square inside, tight on all sides, but with a round 4-in. hole in the middle of one side, set it on a post, 2 ft. above ground with a slanting board leading to the hole, in which fine straw and leaves are placed, and the bird will do the rest. The male wood duck and Mandarin will stand guard at the entrance for a while, but tires of it before the four weeks are up, and abandons the job. Some males injure the young, and it is best to remove the drakes before hatching. I have had two broods in a season by removing the first nesting eggs, but otherwise one brood is the rule. The male moults in June, and will not take any part in a second brood; he then resembles the female, and does not get his bright plumage again until August. Young drakes show red on the bill at two months old.

Hens are useless for hatching the small tender ducks, and the little woodie is very tender. The young ducks come to her for shelter, and she kicks them to death by scratching for them. I have lost several broods in this way. Then I got the "call ducks," those dwarf, or bantam, mallards bred in Holland for calling wildfowl; cute little ducks, the female being persistently noisy; separated from her mate, but the "calls" were not broody when I wanted them to be, or I did not have enough of them.

The first year a wood duck has four to six eggs, next year eight to twelve. The greatest number that I ever got from one was seventeen.

How a Young Wood Duck Leaves the Nest.

Some writers claim that the mother takes them in her bill and others say that she carries them on her back. I had a string of pens back of my house; a pair in each, for they are better to be separated, and usually I found the mother and her brood on the water in the morning; but, on two occasions I saw them leave the nest. The mother went first to the pool and called; she had brooded them for twenty-four hours, or more, and they were strong. Then one after another the little things climbed out of the box and tumbled to the ground, or to the water.

They had to climb 4 to 6 in. of plain board, but they did it. I have seen them climb a roin. base board and go through rin. poultry netting when alarmed. They weigh nothing worth mentioning, and they have claws as sharp as cambric needles. They have pricked my hands until they bled when pinioning them at eight weeks old. I can easily believe that they can climb up a hollow tree and drop 20 ft. into the grass without injury. What need of such sharp claws and climbing ability if not for leaving the nest?

I once had a wood duck that climbed 3 ft. of poultry netting by aid of wings, and then sat on the selvage wires, which were less than 1/4 in. in diameter, and this shows how small a thing their feet can grasp. She went out-

side, into a swamp every day, and tried to coax her mate out, but he wouldn't, or couldn't, and she gave it up and nested in the box provided for her. Usually there was a jin. strip on top to prevent this.

I have spoken of the Mandarin duck. It is a Chinese bird that in everything but color is a wood duck. The prevailing hue with them is old gold. The male has two "fans" on its wings, broad-webbed single feathers, which it can erect, swan fashion. Tastes differ in comparing the Mandarin with our native bird; the colors are not so bright, but there is the softness of hue which we admire in oriental rugs.

Other Ducks.

The redhead is bred in Europe, where it is known as "pochard," but the canvasback they have not. I had many inquiries for this bird from over the water, and went to Havre de Grace, Md., to try to get cripples or netted birds, but got only promises. The gunners there get \$3, and over, a pair for them, and I offered \$15, and would take ten pairs, but got none.

The widgeon, both American and European, I have had, but never bred from them; the minks would not permit it. The pintail I bred once, but lost the brood.

If I ever try to breed our beautiful wildfowl again the pools will be made mink proof by a brick or stone foundation 2 ft. under ground, and 1 ft. above it. The fence on this, with inviting openings for a mink to enter and remain in a trap until he has an interview with me.

There are a few fanciers of wildfowl in America, and the taste for it is growing; in England, France and Germany, there are hundreds of men who breed wildfowl, and it is a most attractive "fad," for want of a better name, and a man must have a fad of some kind, or he will become a lonesome, miserable money grubber. What better sport than feeding your flock of beautiful wildfowl, which most men only think of in connection with the pot? I have bred pheasants, golden, silver, Lady Amherst and others, but they never were as dear to me as the little mother teal, who looked up and said "quack, quack" when I placed her with those little things which she thought to be teal, just because she had laid the eggs and hatched them. To me they looked more like a bunch of catskins from the pussy willow than like anything which might develop into a duck. And yet, a beastly, hairy caterpillar is said to resemble a buckwheat pancake because it is the "grub" which makes the butterfly. We can't tell how the "ugly duckling" may turn out.

Range of Stone's Sheep.

NEW YORK, March 8.—*Editor Forest and Stream:* I talked recently with a Stony Indian from the reservation of that people in western Alberta, and questioned him about the mountain sheep found in that region.

The Stonies are known all over the Northwest as being remarkable mountain climbers and hunters, and they subsist largely on the sheep and goats which they kill among the high peaks.

It occurred to me that Nessadero might know something about more than one sort of mountain sheep, and I questioned him closely on this point. He talks very fair English, and submitted gracefully to cross-examination. He told me that in his country there are two sorts of sheep, one small, dark in color, with slender horns, which are seldom broken; and another sort, larger, pale in color, with heavy thick horns that are often broken at the points. He went on to say that these small "black" sheep are all found north of Bow River, while on the south side of Bow River the big sheep only occur. The country referred to of course lies all on the eastern slope of the Rocky Mountains.

Nessadero's verbal statements as to the characteristics of these two kinds of mountain sheep were confirmed by the signs which he made; for, like most Western Indians, he talks more or less with his hands. The shape and slenderness of the dark sheep's horns, as well as the shortness of its back, were explained by signs, while its color was indicated by touching the dark fur on his shirt. On the other hand, he showed that the horns of the big sheep were at the base nearly as thick as his leg above the knee, "eighteen, nineteen inches," that their backs were longer, and that the color of the hair was gray.

Subsequently I unfolded a map before him, and we went over the matter again, while he pointed out on the map the locality of the two kinds of sheep.

This information is of considerable interest as bearing on the question of the range of Stone's sheep.

In the Bulletin of the American Museum of Natural History (Vol. XII., p. 2, March 4, 1899), Dr. J. A. Allen prints an interesting note on this same subject, recently received from Mr. A. J. Stone, who writes:

"I traced the range of *Ovis stonoi* or black sheep throughout all the mountainous country of the headwaters of the Stickeen and south to the headwaters of the Nass, but could obtain no reliable information of their occurrence further south in this longitude. They are found throughout the Cassiar Mountains, which extend north to 61 degrees north latitude and west to 134 degrees west longitude; how much further west they may be found I have been unable to determine; nor could I ascertain whether their range extends from the Cassiar Mountains into the Rocky Mountains to the north of Francis and Liard rivers. But the best information obtained led me to believe that it does not. They are found in the Rocky Mountains to the south as far as the headwaters of the Nelson and Peace Rivers, in latitude 56 degrees. But I proved conclusively that in the main range of the Rocky Mountains very few of them are found north of the Liard River. Where this river sweeps south through the Rocky Mountains to Hells Gate, a few of these animals are found as far north as Beaver River, a tributary of the Liard. None, however, are found north of this, and I am thoroughly convinced that this is the only place where these animals may be found north of the Liard River.

"I find that in the Cassiar Mountains and in the Rocky Mountains they everywhere range well above timber line, as they do in the mountains of the Stickeen, the Cheon-nees and Etsezas.

"Directly to the north of the Beaver River, and north of the Liard River below the confluence of the Beaver, we first meet with *Ovis dalli*."

GEORGE BIRD GRINNELL.

McKinley.

The History of a Vermont Deer.

On June 8, 1897, Mr. James H. Hoadley, of South Woodstock, Vt., found a male fawn by the roadside in the town of Reading, too weak to stand, and apparently deserted by its mother. It was left for two hours to see if the mother would return and care for it. At the expiration of that time, Mr. Hoadley returned, found the helpless fawn and took it home. It then weighed 3 3/4 lbs. It was fed and cared for like a baby. It occupied a cot in the house, and Mrs. Hoadley fed it warm milk several times during the following nights and days, when the hope of saving its life was almost despaired of. When it had recovered strength, I was requested to name it, and at my suggestion it was christened McKinley. Its rescuer wrote: "The name of McKinley is in every sense appropriate, and as it thoroughly agrees with my political proclivities, McKinley it shall be." As it became strong enough to run about the house and yard, a wigwam was built in the yard and an enclosure around it to keep out dogs, rather than to confine the deer. The enclosure encompassed the back piazza of the house, and whenever McKinley wished to enter the house he would get up on the piazza and look into the kitchen window. If this did not attract sufficient attention, he would rattle the latch of the kitchen door. If that was not noticed, as his horns developed, he would rake the door with one of his horns. Nov. 21, 1898, Mr. Hoadley wrote: "Mac is still one of the family. He is in fine condition. His first and only antlers are a foot long, and there are three points on each." This rather explodes the theory that deer have only spike horns the first year.

During the stages when this animal was being nursed so carefully night and day, its rescuer wrote: "What was at first a work of charity has become a work of love." Since the accession of the horns, however, McKinley has not been a plaything for children, although he still has the run of the house. Yielding to an urgent request and hospitable invitation, I visited McKinley during the February blizzard. He was all that had been represented, three pointed horns and all. He entered the house and sitting room, showed no fear of the visitor, and, in fact, began to rummage in my pockets. A handful of fine cut smoking tobacco was the result of his search, and he immediately proceeded to eat it, as if it had been some sweetmeat. I had wondered how so large an animal could be allowed the run of a well-kept house (and surely I never visited a neater one), but discovered that the deer was house broken, and as clean as any dog or cat. There was not the slightest odor about his body, either. Inquiring about his food, I learned that he had an assortment of grain in his wigwam, as well as a good supply of hay. He prefers the diet of the rest of the family, however, and this is his menu, or a list of what he regards as delicacies: Apple, apricot and mince pies, cucumber, pickles, soap, crackers, cooked meat, fried pork rinds, lard and tobacco. He has oatmeal for breakfast nearly every morning. If not watched he will go to the pantry and steal lard, soap or any other food which may present itself. He will lie down on the rug in the sitting room and when asleep will snore to beat any human being on record.

I have just received a letter under date of March 4, which reads as follows: "Mac shed his right antler Sunday, Feb. 26. He was in the house at the time. Mrs. Hoadley was feeding him apples, when, much to the surprise of us all, it tumbled off on to the floor. He carried the left one until March 1, and we found it in his 'eating' house. There was not a drop of blood nor any visible pain—just a dry and dead bone that had got ripe and was ready to fall. He is meek and gentle, and seems to know that some of his weapons are gone, and he is much less on the offensive."

Here is a wild herbivorous animal, eating meat and all the luxuries of a good table, and thoroughly house broken. Who says we cannot domesticate the Philipinos?

St. JOHNSBURY, Vt., March 7.

JOHN W. TITCOMB.

A Hot Water Lake in Alaska.

FATHER TOSI, a Jesuit missionary among the native Alaskans on the upper Yukon, gives to the Catholic Columbian religious journal a description of a warm water lake, which lies not far from Dawson, as he says.

"It is sixty miles long and about fifteen miles in width. It has no evident communication with the ocean, yet when the ocean is at its high tide on the shores of Alaska, up goes the water of Lake Selawik, and when the tide of the ocean goes out down comes the height of the waters of the lake."

This statement, if scientifically verified, would be of the utmost importance to hydrography, as it would help to solve abstruse problems, regarding fish distribution and other natural phenomena, which could be intelligently accounted for were this underground communication with the ocean positively known to exist.

The reverend father goes on to say that, "notwithstanding this sympathy with ocean waters, the water of Lake Selawik is fresh at all times. The most remarkable feature of the lake is that it never freezes over in the coldest weather, and the colder the atmosphere in its neighborhood, the warmer its waters seem. For this reason Lake Selawik becomes a kind of Mecca in winter for all kinds of fish and water animals, which are found in the various rivers that pour into the lake during summer. The waters of the lakes swarm with fish, and the improvident goldseeker from the United States who has failed to strike that "pile" he anticipated, and who, owing to the fabulous prices of eatables in Alaska, in winter, would otherwise starve to death, has only to borrow a sled and a couple of dogs, and go over to Selawik, where, in a couple of hours he can kill with a boat hook more salmon than he can eat in a fortnight, for after the capture of the fish the excessively cold climate keeps them frozen until they are ready to be eaten. Lake Selawik will also relieve the miners from the disagreeable necessity which they contemplate at present of spending the whole winter without taking a bath. The water in winter is of just the right temperature to make bathing both wholesome and agreeable."

Two Bird Papers.

LAST year's report of the Farmer's Institute of Ontario contains a paper by Mr. Chas. W. Nash, of Toronto, on the Birds of Ontario in Relation to Agriculture. This is based in part on the author's own observations and in part on the investigations made by Dr. Fisher for the United States Department of Agriculture. Mr. Nash's conclusions correspond very well with those of the earlier paper, and he calls particular attention to the very great value to the farmer of the rough-legged hawk. While the owls are regarded by Mr. Nash as of very great use for their mice-destroying proclivities, he mentions a practice of the short-eared species of killing great numbers of small birds, apparently for the sport of it, which is not generally known. He says: "Near my home there is a large marsh, partially surrounded by meadows, which supports a rank growth of grass, rushes and reeds of various kinds. This place is much frequented in the autumn by sparrows and warblers migrating southward; in fact, at times the place fairly swarms with them. Suddenly, a number of short-eared owls will appear on the scene, and then numbers of small birds will be found lying about dead, some partly eaten and others with only the skull crushed and a few feathers plucked off. At these times I have shot many of the owls and have found the crops and stomachs to contain mice and small birds mixed. This will go on for a few days, or until the owls leave, and each morning the number of dead birds lying about will have increased. After the owls have gone, the destruction ceases, only to begin again when the next lot of owls arrive. Mr. Nash next considers the crows, blackbirds and orioles, the woodpeckers, nuthatches, titmice and so forth, the thrushes, sparrows and swallows. The conclusion of the whole matter is that it is worth while to protect our birds. Mr. Nash's paper is written in simple, popular style, and should do much good. It is illustrated by thirty-two figures of different species of birds.

The interest taken in birds by agriculturists is constantly on the increase, and is certainly most interesting, and a hopeful sign of the times. The paper just referred to shows one phase of this interest, while a preliminary list of the birds of Belknap and Merrimack counties, New Hampshire, with notes by Ned Dearborn, shows another. The paper in question was presented to the faculty of the New Hampshire College of Agriculture and Mechanic Art last summer as a thesis for the degree of M. S. This list represents nearly 200 species of birds, and while incomplete is authentic so far as it goes. It is not surprising that the list of marine birds is a brief one. The duck hawk is not rare in the region where Mr. Dearborn has carried on his observations. The occurrence of the summer tanager, reported on the authority of a Franklin observer, is surprising.

Further observations will, undoubtedly, considerably enlarge this list.

Jaguar Ways.

I WISH to say something about jaguars. I have lived here in Mexico for the past twenty-five years, and have always been a great hunter, and kept a pack of dogs.

Jaguars are very hard to hunt, as there is no telling just where to find them. The best way that I have found is to go down on the ocean beach and hunt them on moonlight nights, or with a jack lamp on dark nights. The jaguar comes to the beach, nearly every night, to hunt sea turtle, as they come out on the beach to lay their eggs. I have seen the tracks of three and four, where they had traveled up and down the beach in search of turtles. I have seen them out on the beach until 7 o'clock in the morning, but they generally get back into the forest before sunrise.

The jaguar is very different from the panther or mountain lion. He takes to water freely, will swim a lake or river without any trouble, and strange to say, an alligator does not seem to touch him. An old Indian hunter once told me a fable of the alligator and the jaguar, and how, through an agreement which they made, neither one will trouble the other. A jaguar nearly always kills calves and hogs; a mountain lion will always kill dogs and colts. The lion here very seldom troubles cattle, and they never come down on the beach after turtle. I have never known a lion to swim a lake or river. They both, however, will climb trees. They have from one to two cubs each. A jaguar here is much larger and heavier than the panther or mountain lion. The jaguar will nearly always come back after his kill, even after the bones; the panther very seldom comes back. More deer are killed by the panther, and I think they are much more agile; the jaguar kills more wild hogs; one always sees the tracks of a jaguar behind those of a band of hogs. The best way to shoot them, as I said, is on the beach, for going in the jungle with dogs is hard work, and one gets so full of insects that he is unable to sleep for a week after the trip; besides, the heat and the cutting to get through the forest are something beyond belief.

The best kind of dogs for this kind of hunting is a cross of fox terrier and hound; or cur dog of some large and fierce kind and hound.

Some other day I will give an account of how I killed the largest jaguar I ever saw in this country; I was after him for nearly two years before I got him. I always knew him by his large track. I used a .45-110 double-barrel express. I do not believe in small bore rifles for big game, and I have been hunting for over thirty years, and killed more game than most people. I like my .40-70 Winchester for deer, but nothing smaller. I think, however, better shooting can be done with a double-barrel rifle, and also quicker, than with the magazine rifles.

When I speak of panther and mountain lion, I also include the puma, which is the same animal.

MEXICO.

GUATEMALA.

Spring Arrivals.

BROOKLYN, N. Y., March 8.—Yesterday, during the storm, I saw nine bluebirds and about twenty robins; today I saw twenty blackbirds and the same number of robins. That looks more like spring, doesn't it?

T. H. G.

The Loon's Flight.

Editor Forest and Stream:

I notice in your issue of Feb. 25, in Mr. Sawyer's very interesting account of a vacation on a wayback farm, he says, in speaking of the loon: "He is so heavy for his wing size that he has hard work to get out of the water, and if he were in a very small pond with high trees all around, he would be obliged to stay there, as if he were in a trap."

I wish to inquire if that is generally accepted as a fact, for it is not in accord with my experience.

In 1872 I was one of a party of three landlookers locating pine lands, in northern Michigan. We discovered a small lake of a type common to some portions of the State; a rather large sinkhole, filled with water to within 25 or 30 ft. of the top. This lake, as I remember it, was about eight or ten rods wide, and perhaps forty rods long, with no shore nor shelving beach, the banks going right down at the same steep angle to an unknown depth. The lake was a dark blue, though the water was as clear as a crystal. It nested in the heart of a Michigan forest, surrounded by high trees, without a break in its banks to denote an inlet or outlet. It was an ideal place for a camp, and we pitched our tent on the banks and stayed as long as our work would permit, for there were more black bass to the square rod in that little lake than any water I ever found.

The first morning early I was out on the lake on a small raft, and had bass enough for the day, having just wound up my line, when over the treetops came a loon and dropped into the water within 20 ft. of me. He gave me one surprised inquiring glance, and down he went. I could see him in the clear water, as he went straight down until he was lost to sight in the deep blue of the depths. In a moment, as I stood watching where he disappeared, I saw him coming up; with incredible swiftness he shot into the air like an arrow, and I only had time to doff my hat and call a hasty good-by, as with a mocking laugh he disappeared over the treetops.

G. O. BIGNELL.

A Singular Rabbit.

CORNISH, Me., Feb. 21.—Mr. Win. C. Ayer, of this village, an ardent sportsman in general, and especially devoted to hunting rabbits, bagged a specimen of his favorite game yesterday, which differed materially from anything in the rabbit line ever seen about here.

In size it was about two-thirds that of the ordinary rabbit, its color, instead of white, a dark gray, mainly, with irregular lines of black showing on the back, the gray passing into a bright fox color (red) on the lower parts of the body and legs, with a spot of same on the back of the neck. The body was quite compact, the legs short, the ears comparatively small, but the head and face presented the most singular feature, the fore part of the skull being broad and flat, the chops full like those of a chipmunk, and the shape and expression of the face decidedly cat-like, in striking contrast to the stupid frontispiece of the common, every-day sort of rabbit.

"Some one's pet bunny gone astray," will doubtless be the verdict of many who read this, but no one seeing the animal would entertain that idea for an instant. Old hunters who have shot hundreds of rabbits declare they never saw anything like it before. What think you, readers of FOREST AND STREAM, is it a hybrid, a stray from some variety not common here, or, in fact, what is it? Can any of you name it from my imperfect description?

TEMPLAR.

[If Templar would send us the skin and the skull, identification might be made.]

Game Bag and Gun.

Anti-Hounding Laws.

LAWS forbidding the use of hounds for deer chasing are in force in Wyoming, Montana, Idaho, Oregon, Vermont, New Hampshire, Pennsylvania, South Dakota, Minnesota, North Dakota, Michigan, Maine, New York, Washington, Colorado, Utah, British Columbia, New Brunswick and Quebec.

The Adirondack Deer Law.

THERE are eleven Adirondack guides, all members of the Guides' Association, at the Garden. Some were sent to represent the Association, and others came of their own volition. The men are representative of Franklin and Hamilton counties, in the heart of the Adirondacks, and the sentiments they express conform very closely, as far as your correspondent has been able to ascertain, to the sentiments of hunters who live in most of the other sections of the Adirondacks. The Fulton chain hunters, however, and those living on the southern edge of the woods are probably an exception.

The names of the guides at the Garden are as follows: E. E. Sumner, Saranac (president of the Guides' Association); B. R. Moody, Saranac; H. S. Moody, Saranac; Fred Sheldon, Saranac; Warren Cole, Long Lake; Lucien Trim, Meacham Lake; J. Howard Slater, Saranac; Fred Colbath, Saranac; E. J. Chase, Newcomb; Florimund Chase, Newcomb, and A. N. Billings, Lake Placid.

Seven of these eleven men were seen and talked with, and all expressed themselves in favor of hounding. Of the other four, three are said with certainty to be in favor of a law permitting the use of dogs, and the other man was said to be on the fence.

These guides are thoroughly representative, and the fact that there is such a practical unanimity among them on the hounding question indicates the current of local sentiment throughout the entire region. They want the month of October for hounding. For years Adirondack hunters have asked no more than this, but their wishes have received little attention, and they have grown accustomed to having laws forced upon them which they did not want, but had to obey.

There are some apparent contradictions in the situation, which need explanation. Last year some of these

same men who now express themselves in favor of hounding voted an indorsement of the non-hounding law. These men are some of the most intelligent and far-sighted of the guides. They explain their position by saying that they believe it would be a good thing for the game of the Adirondacks if an effective prohibition could be put on the use of dogs. They argue that other States have benefited by such prohibition, and they are thoroughly acquainted with all the evils of a hounding system. On the other hand, they say the anti-hounding law is a kid glove law that is not enforced, and that it has turned out a boomerang, as far as game protection is concerned. It works hardships on honest men, and, like the excise laws under some political regime, gives dishonest men unusual advantages.

It is a matter of common knowledge that under the law hounding has been carried on in every section of the Adirondacks. This journal has printed something about the laxness of protectors in the eastern Adirondacks.

Touching on the same subject, as regards the western side, Mr. Colbath states, "They have hounded right along, and there was more hounding last year than ever before. You couldn't go through the lakes anywhere in the season but what you'd hear dogs hounding. Of course any man knows that spoils all still-hunting."

Mr. Sheldon said: "There have been hounds running all summer, and more deer killed under the anti-hounding law than any law we ever had. I come right out and say if the law can be enforced I believe in it; but I don't want any more of this farce we have been having."

It is only the minority of these guides, however, who believe that the prohibition of hounding if effectual would be beneficial. Most of the men present come out flat-footed for hounding, and nothing but hounding, and say that for a number of years past, with hounding permitted, deer have been on the increase all through the Adirondacks. Major Fox's forestry reports indicate this. The great hubbub against hounding was the spasmodic outbreak of a number of men, most of whom never killed a deer, and none of whom lived in the country for which the legislation was originated. Theoretically, it is a good law, but it isn't always wise to force a good thing on people who have no use for it, simply because it is a good thing. Theoretically, religion is good for the savages, but when the Spaniards undertook to inculcate it with blunderbusses and swords they made a mistake.

The reason that the anti-hounding law has not been enforced in the Adirondacks is that it wasn't wanted, and that it is an infringement of the principles of home government. The men who fostered the law tried to make it appear that the law was acceptable to the native sportsman, and for a while they exerted a strong influence on the guides, with the result that to the casual reader of the sportsman's press the law was apparently regarded with favor in the region which it affected.

They could not, however, reach the majority of the hunting population, and many of these men disregarded the law, and as no one liked the law, they were not punished.

It looks very much as if the anti-hounders have been going ahead too fast. Their wisest course apparently would be to open a campaign of enlightenment throughout the hunting country, and try and win over the hounders to their side. That is the only way to bring about effective legislation in this country. It is not the part of wisdom to misrepresent facts and bolster up an unpopular law by allegations that it is what the persons most interested wish.

There seems to be a growing sentiment through the Adirondacks in favor of putting the deer hunting on a new basis, from that which has ruled for many years, but till this becomes the majority sentiment the sponsors of the anti-hounding law are committing an injustice in forcing it on the people, and may expect to see it largely a dead letter.

B.

At the Sportsmen's Show.

Nesodaro's Bear Story.

Nesodaro, the Stony Indian, entertained some visitors with the following bear story:

"Me hunt grizzly in deep snow on the mountain," he began. "Me and twin brother, name Joshua. Me got big cartridge forty-four caliber; Joshua, short forty-four caliber. Joshua like go hunt marten; got four little traps. No like hunt bear."

"Me see track; grizzly come down mountain, so," and Nesodaro walked his clenched hands pintoed fashion across the top of the desk that occupied the center of the tepee.

"Me see track. Grizzly stand up this way, all same man. Broke tree down on snow. Went up same as man, caught tree in mouth. All cut 'em!" Nesodaro snapped his jaw to on the last words, and threw into his expression something of the savage ferocity of the beast.

"Joshua he say, 'I think grizzly pretty bad?' I say, 'Ah t'ink so, too.'"

"Joshua say, 'My gun no good.' Go more; small trees bent down; all cut 'em. Joshua say, 'Look out!' Very bad bear; me no like hunt bear; me go hunt marten. You like hunt bear, all time; you go."

But Nesodaro had no intention of letting Joshua back out. To assure the wavering hunter he said:

"My rifle pretty good; bullet go quick!" and he slapped the open palm of his left hand a resounding blow with his right clenched fist. Then Nesodaro told how the bear turned up a dry creek and climbed up to a grove of timber and began searching for a place to make a den.

"Not too far; bear make hole in snow. In ground find 'em big stone. No make hole; no take 'em 'nother place hunt; no take 'em. Hunt, hunt. Oh! lots of times no take 'em."

"Little coulee come down. Bear make hole now—way down. Three big tree fall 'cross. Branch reach down to ground. Bear go under. Last night take grass into hole; little hay."

"I say, 'What do now?' Which side shoot?"

Nesodaro took a pencil and drew the three big fallen

trees propped up a few feet above the ground, with their drooping branches shielding the entrance to the den. Then he stood up, threw his body back and extended an imaginary gun at ready with his finger on the trigger.

"Me stand here," he said, placing himself directly in front of the opening under the desk, which he characterized as "all same as hole." "Joshua stand there," and he waved his hand in the direction of the swimming pool roys. away.

"Me go up to hole four time. No see bear. Go close. Now bear come out." Nesodaro emitted a snappy growl to indicate that the bear wasn't in any better humor than had been when he showed his surly temper by breaking down the trees.

"Me jump back. I t'ink six feet. Bear catch pants. cut 'em my pants." The Indian's face grew tense. He pointed his imaginary gun toward the floor in front and pulled an imaginary trigger. "No good; no shoot." He made the motion of cocking the rifle and pulling the trigger again. "No shoot." Apparently bear and man were standing face to face, separated by only the shortest interval of space.

"Joshua take gun." Nesodaro made a slow, clumsy motion, as if cocking the rifle, to show the other Indian's backwardness in the fight.

"Pretty soon Joshua shoot. No good shot. No shoot a bone." Nesodaro put his finger to the side of the neck to show the spot where the bullet hit. Then he growled again, and announced that the grizzly retreated. Nesodaro had at last succeeded in getting his rifle in working order, and as the bear turned tail, he shot at it four times in quick succession. The bullets hit the bear in the back and came out its shoulders on each side of the neck, but did not seriously injure it. Nesodaro called himself "bad man" for not placing his bullets to better advantage.

"I want to shoot you, bear," he said. "I want kill you to-day, I say."

The bear back-tracked toward the spot where the Indians had tied their ponies in the timber, and Joshua said:

"I t'ink horses catch 'em."

The bear did not, however, attempt to molest the ponies, and when the Indians came to the place where they were tied, they mounted and continued the chase on horseback. As for the grizzly, it never swerved from its course, and Nesodaro realized that it was going directly toward his camp. He knew that his wife was in the immediate neighborhood setting marten traps, and it became his turn to be alarmed.

"Oh, I t'ink my squaw catch 'em," was Nesodaro's way of expressing his fear lest the bear should kill the woman.

But the impending tragedy betokened by the serious expression of the Indian's face passed quickly into farce.

"Three marten traps finish my squaw. Go more; now, away up mountain."

"E-e-e-e-e!" Nesodaro was imitating the shriek of his terrified spouse. "Bear no see squaw; my squaw see bear." He grinned. No one need say an Indian hasn't a sense of humor.

"Down mountain come bear. Down mountain come squaw. My squaw's tongue come out, I t'ink, six inches." Nesodaro bent his head to one side and let his tongue loll out, at the same time making a noise in imitation of labored breathing.

"Squaw scared now."

"Go back home to tepee!" I say. "Go back home, quick!"

"Little coulee, squaw jump up; my squaw jump fast. She say, 'Yes, I see pretty big bear, pretty close.'"

"Pretty" was the Indian's strongest word to qualify size and nearness. The woman's expression interpreted means that she saw a regular mastodon of a bear right on top of her. The lady had reason to be alarmed, and allowance should be made for the tongue. It was a nerve-shattering incident, and Mrs. Nesodaro hadn't been educated up to the point of going into hysterics.

"Oh, ho!" I say. "Bring my dog; ask him br-r-r."

Nesodaro made a sound which no doubt was the Indian equivalent for "sick 'em." "My dog name Dick. I say, 'Come on, Dick; come on, Dick; come, Dick. Go now, hunt bear.' Pretty soon, 'Wah! wah! wah!' Catch 'em dog back leg."

The dog caught up with the bear and was worrying it. The hunters followed on their horses by a rather circuitous route, as the bear had taken a path through a very thick place. Presently Nesodaro sighted the grizzly laboring through the deep snow, bleeding freely and panting "haw, haw, haw."

He shot three times and only succeeded in breaking one of its forelegs. Joshua came up and shot once, but "bear no dead." The poor grizzly made a final rally, and standing on its hindlegs faced the hunters. Nesodaro ran in close and shot it in the head, and down it came, done for at last.

It was an all-day hunt, and the men were so fatigued by their exertions that they barely had strength to regain their horses and make their way back to camp.

Nesodaro Acts the Knight for a Lady in Distress.

On one occasion, when Nesodaro was in the eastern part of British Columbia on a hunting trip, he ran across "Shuswap Indian horse, got no man." There was an Indian woman with the horse, however, and this woman, with the guile of her sex, told Nesodaro that all Stonies were good hunters and he among them, and that she wanted a proof of his skill. She was "pretty hungry," she said, and she intimated that it would be an easy matter for such an accomplished gentleman to take her horse and go off and get her some meat.

So Nesodaro, feeling as if the whole world was contained under his old felt hat, mounted the horse, and accompanied by a dog named Jack, which had been given to him at Banff Hot Springs, set out in search of game.

"Pretty soon me see grizzly. Me go quick now. My dog smell 'em bear now. I say, 'Go, Jack; quick, now.' The dog turned the bear and it charged the hunter. He stood his ground, expecting to get a head shot; but the bear kept its mouth open wide and he could see no sure place at which to aim. Finally he fired at the neck, but the shot did not stop the animal, and again Nesodaro's "pants" were in danger.

The dog came to his rescue, however, and turned the bear, giving the Indian a chance to put a ball through its shoulders, which ended its career. After skinning it Nesodaro packed a quarter and the hide on the horse, and then mounting himself on top of the load made down the mountain to where the Shuswap woman was waiting. He gave her half the meat and seemed to think she was very well satisfied with the bargain.

Snaring Bears.

"We catch bears up in our country in three ways," said Willie Paulson, the moose hunter from the Temagami region on the upper Ottawa. "Sometimes we use steel traps, sometimes dead falls, and sometimes snares. For making snares we take along with us a kind of hemp line imported by the Hudson Bay Company. This line has twelve strands, but it is a very small line, no thicker than that," and Paulson reached out and caught between his fingers an insulated electric wire, connected with an incandescent lamp, which was suspended from the roof of the make-believe tepee put up for the entertainment of the grown-up children in the Madison Square Garden. "We select a good place on a bear road for setting the snare, where a good stout sapling for a spring pole happens to be growing with a fair sized tree nearby, and then we cut two poles 8ft. long or so and sharpen each at one end. We drive these poles into the ground side by side and on a slant so that their upper ends will come one on each side the large tree at a place 3 or 4ft. above the ground. Then we lash them firmly to the tree, so that they will stand the yank of the spring pole, and also the struggles of the bear after he is caught.

"Then we trim the spring pole for 20ft. or more and lop off the head, leaving a crotch. We get other poles over this crotch and bend the spring pole down till the end just touches our slanting poles, which were lashed to the tree, and then we tie our snare to the spring pole and also to a short piece of wood, which we lodge crossways under the slanting poles, and that holds the spring pole down. A slip noose is made of the rest of the line and hung under the slanting poles, fastened to little sticks to keep it in shape, and then we take fir boughs and lay them against the snare so the bear won't see the line.

"The snare catches the bear around the neck, and when he struggles to get away it releases the short cross piece of wood and the spring pole flies up and draws the bear's neck against the slanting poles. That shuts off Mr. Bear's wind and he soon chokes himself to death."

Moose and Caribou.

"I've done a lot of hunting since I was able to hunt," says Paulson. "I began as a little boy, going off on a hunting trip with a man by the name of Jimmy Ellis. We spent the winter making dead falls for marten and fisher, and running moose on the crust, after the snow got deep enough. I followed a moose one time all alone, and the first thing I knew he got tired of being chased and made up his mind to chase me instead. I looked up and there he was a-coming, making the snow fly and looking ugly. Moose 'aint pretty no time, and when they're mad they look like the devil.

"I stood my ground and never stirred, and when the moose got up to 20ft., I shot him square in the forehead, and he dropped in his tracks. I had a rifle. Some Indians who use smooth bore shotguns and bullets, say the ball won't go through a moose's head. I don't know about that; I know a rifle ball will.

"It used to be that long ago the further north you went the more caribou you'd strike. It is not so now. I had a friend who went there last winter who said there were not many caribou. Where I live there are a great many. I used to see them come out on the lake every day to eat slush. This was Barrier Lake, up toward Abitibi. All through the winter the ice cracks and water comes up through and melts the snow. Caribou like to eat that, and that is the reason they come on the lakes."

A Bear Murderer and Canibal.

"Jimmy Ellis was following the track of a bear one fall when he seen where it killed and ate another bear. It was a big lean bear, and it found where a little fat bear had denned up, and it pulled the little fat one out of its hole and ate it.

"The big bear commenced to eat the other bear along the breast bone, and he ate him all up, just like a bear turns over a porcupine and eats him out of his skin.

"Jimmy Ellis' chum was with him, and he said 'I'm going to take this skin and stretch it,' and the lad took it home and got \$10 for it.

"They followed the big bear up for a whole day, but they couldn't catch him. They runned him with dogs, and camped out at night, but he traveled faster than they could. They only had their dinners with them, and they were pretty hungry when they got home."

Bear Character and Habits.

"Young bears come out in the spring sooner than the old ones. They're not so used to starving as the old ones, and they ain't got so much sense. You see the old bear knows a good deal; his tracks will be seen in the snow.

"The bears come out pretty fat, but they get poor in about a month. There ain't much feed for them in the spring, as early as April. They eat bark off the trees before the leaves come out. Don't know the kind of trees you call them; they grow along the shore. I think it a kind of willow. Then they eat these ants on the trees, and a kind of grass that looks like the Scotch thistle, only it has no thorns. That comes up through the snow and keeps green all winter. They eat it, right down to the roots. Some bears that are hungry come out all through the winter to look for something to eat.

"Jimmy MacDonald saw a bear catch a young moose. He saw the bear sitting on a side hill, lying beside the trail for the moose. Pretty soon the moose come along and the bear jumped and caught him by the top of the neck, and dragged to pull him over. The moose just kicked once, no more, and he broke the bear's back, and that bear didn't try to catch any more moose.

"Bears bite trees all through the summer. I think they do that to see who is the tallest one. Only he bears bite trees. They bite them along their roads, and the one that makes the tallest mark bosses the road. After

you kill the big one you don't see another he bear for a long time on that road. She bears pass any time."

Opinions of a Courier des Bois.

Alfred, or Fred, Lavoie is a short thick-set little Frenchman, with a swarthy complexion, black hair and eyes, and a chronic good humor. I asked him if he ever knew of one bear eating another, and he replied:

"Oh, Lord, yes. See that a good many times, where a bear was caught in a trap. They catch 'em in a heavy deadfall; heavy as ten loads a man would carry. Yuther bears come along and eat 'em out.

"Mink 'll eat other mink, too."

Lavoie says that when bears come out of their dens in the spring for the first two or three weeks their diet consists chiefly of "grass balls" from the swamps or rocks, and "bugs," and also the sweet sap of the balsam, obtained by stripping the bark from the tree and licking the sap from the trunk with their tongues. "Bear lak' sweet, sugar," he added. "Dey peel de spruce, and yellow and black birch, too. Var' fond, sugar."

He says that in spring the bears follow the rivers, and in the fall, "go everywhere."

Lavoie was a dog driver for the Hudson Bay Company thirteen years. He has driven as many as fifteen huskies in one train. The leader when in harness was 45ft. away, and to reach him Lavoie carried a sealskin whip between 35 and 40ft. in length. This whip had a handle 15in. in length, and beyond that where the whip proper began, it was 1½in. in diameter. Lavoie always rode with his dog team. He laughed at the idea of running behind as the Mackenzie drivers do a good part of the time.

He has been to Big Lake Mistassini, and made seven or eight trips to Hudson Bay by all the common routes. He says there are few moose and caribou in the neighborhood of James Bay, but plenty of grizzly bears and white bears. The Esquimaux kill the bears with spears.

Bazile Maurice is a man of the same general type as Lavoie, except that his complexion is ruddy and not swarthy. Lavoie speaks of him as "Bozzle," and scratches his head in a puzzled way when anyone asks for "Baz-zeel," with the accent on the last syllable. Bazile Maurice has been in Egypt in the capacity of expert riverman for General Wolseley's Nile expedition. He has seen hippopotami, and other wonders of the ancient river. When he told of the hippopotamus, he described such a remarkable and formless aggregation of flesh, that I somehow got it in my head that the thing was quite spherical and floated on the water, and as Bazile couldn't for the life of him think of the English equivalent for what he called "le pourpatin" (spelling not guaranteed), it was some time before we understood each other, and advanced to the consideration of other strange beasts, such as "leecard" and "black snake."

The "Kroomans," who are "regular niggers what we hired to work for us," eat crocodiles and fish, but the white men abstained from both. Bazile says the fish didn't look right and tasted muddy. On one occasion he saw some great creature pass in front of his boat that he thought was a crocodile. The natives said, however, that it was a fish. Bazile leaped overboard into the shallow water with an axe and succeeded in killing it. The fish was similar in shape to a whitefish, but very much larger. It weighed 112lbs. There are a great many ducks of all kinds in the Nile. Bazile says that in the middle of winter they buried eggs in the hot sand and cooked them in six minutes. He is not certain but that since he left the birds have progressed to the point of laying hard-boiled eggs ready for the table. At any rate, the sand was so hot that the first portage they made it burned the voyageur's red leather moccasins till they broke like dry sticks when bent.

The Quebec Elk Herd.

Bazile has been in the Grand Lake Victoria country, where the only wild herd of Eastern elk, of which anything is known, exists. He says it is a good hunting country, with open woods, through which a man may easily see game at distances of 500 or 600ft. The timber is spruce, birch, white and red; red pine and balsam. He has seen elk there, but never killed them, because he never happened to be there in the proper season.

The Time when Indians Don't Care to Meet Bears.

"BEARS mate in June," said Mr. C. C. Farr, who was fifteen years with the Hudson Bay Company. "June is the only time Indians don't care to meet bears in the woods unarmed. They run in strings of seven or eight at a time, sometimes, and they're ugly. The Indians are afraid of old shes with cubs, but in the mating season they're pretty careful how they go around without weapons. When an Indian sees a bear lying down in a trap, he is pretty careful about not going too close till he is sure the animal isn't only making believe to be dead. Some of them get into awkward situations at times, and some of them carry scars to show for their adventures.

"I never knew of but one Indian that was killed by a bear. That was one of the McDougalls—strange name for an Indian, but he was one all right enough, and pure blooded. This McDougall went out to watch for bears when they were going on the rocks for berries. It was just before sunset, the best time for the bears to come out. He paddled across a lake in his canoe with his boy, and when he got to the place he left the boy behind and went out on the rocks. He had a single-barrel shotgun, loaded with ball.

"The rocks were burned and he could see a way off, and there was a bear feeding on the berries. The Indian got up close to the bear and fired. It fell right over, and very foolishly McDougall didn't stop to load, but ran in with only his axe in his hand. The bear wasn't dead, and when McDougall got close enough it clinched with him, and they had a terrible fight. The Indian killed the bear in the end, but he was so desperately lacerated he could hardly walk.

"He was thirsty after a fight like that, but there was no living water on top of the rocks, and all he could find was stagnant, but he tore right in and drank the nasty rotten stuff and filled up with it. After that he went back to camp and died. I think it was the water killed him much as anything."

"The bear is a strange beast. An old Indian when he kills a bear takes a hold of its paw and says, 'Thank you, Mr. Bear, for giving meat.' If he didn't do that he thinks he wouldn't kill any more bears. If a bear's bowels are out of order, he knows just what plants to eat to regulate them. I don't know exactly what they take, but I think one thing is the kind of Scotch thistle that grows wild."

"In the spring, when the bears come out, they can get very little to eat, and fairly starve. They eat any blamed thing they can get a hold of till the suckers come along. Then the bears stand in the creeks and scoop them out. When fish are plenty they like to leave them on the bank till they get a little high, and then come back later and eat them. This habit gives the Indians opportunities to trap them."

J. B. BURNHAM.

Red Letter Days.

IV.—Caribou Shooting.

THERE is a well-known story—of the accuracy of which I cannot vouch—of the notice in a Western saloon, in large letters over the head of the musician, "Don't shoot the poor beggar at the piano; he's doing his best."

May not this be said, figuratively, of one of the class of "old reminiscences," so-called, in his feeble efforts for the public good? When sympathy for this relic of the past increases as years roll by, and when he "takes stock" of reminiscences, as his only solace, happy the man who can put his hand upon what even he may consider a few "red-letter days," and hold them up to view as things to be admired. Better still, if he can before night sets in, add to his stock of these much-valued days; sympathy may thus for a while be averted.

The writer, though not having yet aspired to the rank of an "old reminiscence," having reached the stage of "take it easy, or if you can't take it easy, take it as easy as you can," or, in other words, being "untasked with needless services," found himself not long ago in company with an old friend one winter's evening engaged in the aforesaid occupation—"taking stock." The smoke curled slowly from the mouth of each. They had, as evening advanced, told their stories, and silence reigned, each being evidently occupied in building castles in the air. At last one of the party, more enterprising than his neighbor, ventured to speak, and this is what he said: "Surely reminiscences are not all that is left for us. We'll do deeds to follow on our words. Some red-letter days still remain for us—even for us."

This speech brought both old sportsmen simultaneously to their feet. Yes! both could still do a good day's work in green woods and on barrens. The hand and eye of each could still work together in that which gives so much thought to the novice in the gun trick business, viz., trigger squeezing, and can only be learnt by that which teaches—experience. They therefore resolved to make immediate arrangements for a few days caribou stalking before the close season then approaching set in.

Two well-known Indian guides in these parts of eastern Canada, the brothers Jim and Joe Paul, were secured; a line of barrens not far distant, Eastbrook Plains, were selected; the usual camp rations were procured; and in a well equipped double sleigh we moved off, a cheery party, reminding us of many a similar expedition in days gone by. The last house in a settlement, ten miles from the plains, was reached at an early hour, and we changed from our comfortable sleigh to a less comfortable country sled. These ten miles over rough woodland roads on one of winter's coldest evenings, were cheerless in the extreme, pointing to the conclusion that even caribou hunting is not all "cakes and ale." Before night set in, however, we reached a spot in green woods not too near the plains affording shelter from the wintry blast, and with a good supply of fuel wood available. Here we decided to camp. Two small lean-to tents facing inward were soon pitched, wood was cut, fire made, supper cooked, and as we sat on our waterproof sheets laid on the snow, discussing the evening meal and the prospects of the morrow, difficulties and drawbacks fled to the winds, and each could say with all his heart, "There is pleasure in the pathless woods."

All save Paul rose bright and early the following morning; the cook, busy preparing wagan (food), we old soldiers looking to ammunition and rifles (mine a Hotchkiss repeater, my comrade's a short Snider-Enfield). The ablutions and toilet of each being minimized, suddenly Paul starts from sleep. "Caribou we get to-day—good dream. Plenty caribou!"

There was therefore, with this good prediction, no time lost in the morning start.

There was but little snow on the ground, with enough in the woods for fair snowshoeing, while on the barrens we took off snowshoes and had good walking in moccasins. With happy reflections en route, we are moving on quickly, but silently, Paul leading, we following in single file. We pass through some perfect caribou country, cranberry plain for the most part, where "browse" (moss well-known as *Lichen rangeferina*) is plentiful, with here and there a few stunted spruce bushes; and here and there the country is broken by an occasional hill or a small ravine. When about three miles from camp, we came upon fresh tracks of a herd of caribou, about ten in number, judging by the "beds" in the snow (their last night's resting place). There was also abundant sign of their search for food (the many holes made with forefeet when uncovering the lichen). Here again we "off snowshoes," there being but little if any wind, in order to creep carefully upon the game.

We had not crept far, when, ascending a small hill, I saw the heads of the herd. A low whistle from me brings our party to a halt, and a short council of war determines our course, viz., to retrace our steps, and then make a cast well around, so as to approach the herd from almost the opposite direction from that we had been taking, and thus to move up wind, if any, and besides gain some slight covert in that quarter.

Stealthily and carefully we move; it seems hours before we gain the desired spot. Paul does the work of commander in chief in these difficult tactics. Not a word is spoken. We arrive at a place where we can only creep on hands and knees without disturbing the herd, the hands and knees of each of those who follow being

carefully placed in the spot previously similarly occupied by his predecessor. Thus we avoid the noise of breaking the crust of snow. Suddenly Paul lifts his head and points, and there, (what a picture for an artist!) we saw the herd at about 300yds. distance, utterly ignorant of their danger. Paul advises opening the ball at this range, but, no; from experience I well know how small an object a caribou presents at 300yds. We decide to creep on further to a bush within about 100yds. of the herd. Careful as we had been hitherto, we are doubly careful now. Could we but hush the noise of breathing! Oh, that we were dressed in snow-colored garments, and thus could avoid being seen and heard! Each yard seems a mile. We had besides lost sight of the quarry in the undulating ground. At last we reach the spot, a motion of my hand brings my comrade to my right side, and as previously arranged, the man on the right takes a caribou on the right, and vice versa. We have only to pick and chose. A fine yellow stag on the left stretches his lordly form. I must have him. I aim—no! I bring down my rifle. A darker one, with good horns appears in view. Ample time for display of "fine discipline." I decide on him. My friend selects another with horns. At a given signal we fire. My bullet reaches the desired haven, behind the shoulder, his falls short. The herd is quickly afoot. My stag plunges forward and bites the dust of snow. This checks the herd in their onward course. They only move about 300yds., with a series of bounds, then stop and turn to seek their fallen brother, then off again. This gives another and yet another chance to us. The game of "hide and seek" goes on. Every bush, every undulation of the ground is taken advantage of. We fire now at long ranges. A well-directed shot from me and one from my friend pull down a couple more of the herd—some more careful stalking. We gain another vantage spot. We again open fire and secure two more of the herd, making a total bag of five caribou. (We had also a wounded one to follow—this we got subsequently.)

It must be stated that this occurred before the day's of limiting the number of caribou for each gun. Anyway, old sportsmen though we be, five caribou "before the sun had crossed the yardarm" on the first day out we considered not too bad, and in "taking stock" of "red-letter days," we can now go "one better."

FREDERICTON.

Snowshoes.

Editor Forest and Stream:

IN FOREST AND STREAM of March 4 Mr. Mather speaks of snowshoes and gives an illustration of different shapes. For such uses as I have for snowshoes, I prefer a long, narrow shoe, more like the No. 1, or the Alaska model. I used such a pair one winter on a trip after moose in Nova Scotia. The rest of the party (who were residents of the Province, as well as our Indian guides) used much wider shoes, more after the Montreal pattern. The oldest Indian in our party, after looking at my snowshoes, asked: "What are you going to do with them kites?" I think, however, that he, as well as the others, were convinced before our hunt was ended, that my shoes for practical work were as good, if not better, than the style used by the rest of the party.

What I wish to say relative to snowshoes is principally regarding the filling. Such snowshoes as are for sale in most of the stores, while pleasing in general appearance to a novice, are not as a rule very satisfactory for hard practical work. The filling when wet will sag badly. I was speaking about such shoes to a Maine guide, who uses snowshoes a good deal, and who made those he used. This guide said the cause of many snowshoes bagging when wet was on account of the filling not being properly stretched before the shoe was filled, or, as he expressed it, "The stretch had not been taken out." His method of stretching was to soak well in water the hide used after it had been cut in strips, then to take a flat piece of bone or part of a moose or caribou horn, bore a small hole through it and draw the strips of hide through the hole. This, he claimed, stretched the filling to a certain extent, and also grained it; then the filling was fastened together in the usual way, making a strip long enough to fill a shoe. It was then thoroughly soaked, and then selecting three small trees standing in a triangle a few yards apart, he would wind the filling around the trees, going from one to the other, stretching it all he could; then getting a number of sticks of timber, lay quite a number across the filling between the trees, and let them remain until the filling had dried; by putting on considerable weight he claimed that the stretch would be pretty well taken out. After the filling dried it was again soaked, and woven into the frames. This guide said there was more work in preparing filling in this manner, and that when making snowshoes to sell the filling was not stretched at all excepting what stretching was done when weaving it when wet in the frames. Such filling when dry always seems as tight as possible, but after it gets thoroughly wet it will sag badly.

The filling of about all the snowshoes, I have seen as sold by dealers, was said to be caribou hide. I know those I used which were said to be of such material gave out in a short time. The men with whom I have talked about snowshoes and who made those they used, said that the hide of a three-years' old steer made as good filling as they knew of. A good dead depends on preparing the hide. If the glue is not nearly all removed the filling is liable to be brittle and break when using on cold, dry snow. My last two pairs of snowshoes were made by two of my neighbors. Both pairs were filled with steer's hide. Yet the filling of one pair will and has outworn the other.

There are several methods of fastening on snowshoes. In Maine I found the usual way was to use a long strip of leather or buckskin, which was fastened to the toe loop and then wound around the foot and back of the heel and tied over the instep. It was claimed that when fastened in this way the snowshoe could at any time be kicked off by giving the foot a twist, in case any one should break through the ice when crossing a lake or stream. I could never make this strap

fastening work well, as it was continually getting loose. The fastening I have found the most satisfactory is to have quite a broad strap fastened firmly to the shoe for the toe of the foot with a strip of leather running back under the sole, and a heel strap very similar to the old style heel strap of a skate, and with a strap buckling over the instep. When crossing any place where there is a chance of breaking through the ice I always unbuckle the strap over the instep. The snowshoe will stay on fairly well in this way, and I can kick it off at any time.

Mr. Mather speaks of paying an Indian \$2 to make a pair of snowshoes. I cannot get such a pair as I want for any such a price. My last pair I paid \$6 for, including the fastening, and the man who made them cannot turn out such a pair in less than two days, and he does not care to make them to sell, even at that price. Such shoes as I now use do not compare favorably in appearance with the fancy-looking articles in the stores; but for practical hard work over rough ground, windfalls and such places, I have found them worth several pairs of the fancy-looking ones.

C. M. STARK.

DUNBARTON, N. H.

CHICAGO AND THE WEST.

Goose Shooting at Chicago.

CHICAGO, Ill., March 11.—Mr. Townsend Smith, who lives at Lake Bluff, a suburb some thirty miles north of the center of Chicago, tells me that he has for several years had very decent shooting at wild geese, the Canada honkers, near his home, sometimes killing two or three dozen during the spring season, and one day bagging as high as seven splendid specimens of this wary bird. It seems that there is at times quite a decent flight of geese in and out of Lake Michigan, and I have myself seen these birds dipping down into the lake, a mile off from shore, at a point not very far from the city. Mr. Smith tells me that he gets most of his geese on the cornfields about a mile and a half inland from the lake, where the geese are in the habit of coming to feed. He uses decoys, just as one does in stubble-shooting in Dakota, but does not dig any pits. His way of shooting the geese is simply the old-fashioned corn-shock shooting which we used to practice out in Iowa years ago. There is no better blind than a corn shock, and this sort of shooting has the advantage that one can shift from one part of the field to another, according to the way the flight may be coming in. As I remember this sort of thing, it used to be very exciting to see the long, low, black line of birds coming in from a distance, with the average chance much against their coming within range. I should think Mr. Smith would prize his honkers very much, getting them thus, as he does, so near this big city. He tells me that very often parties station themselves on the bluffs near the lake and shoot at the geese with rifles as they pass over, going high and quite out of range of the shotgun. He knew one man to kill four in this way during one afternoon. One time he caught a flock of honkers in the open lake near the shore, so close that he was able to stalk them and kill three before they got away. When I add that Mr. Smith tells me he sometimes gets splendid snipe shooting near his home on the Skokie marsh, often as many as fifty birds to a pair of guns, I have perhaps added something to the data regarding Chicago as a shooting resort.

From Texas.

Mr. Wallace Clark, of Chicago, recently came back from a shooting trip in Texas, where he was located at Fordham, in San Patricio county. This is near the Rockport country, of which I have written so much. Mr. Clark had all the duck shooting he wanted, and was delighted with his trip. He said that he sometimes saw as many as 20,000 geese, he should think, in one body, such a sight as always sets wild a Northern man who sees these great bands of fowl for the first time.

The Wisconsin Duck Question.

A Milwaukee journal this week contains a strong communication from Mr. L. F. McLean, of Fond du Lac, Wis., who writes to antagonize the views of another gentleman who wants to see killed the bill which is intended to stop spring shooting in Wisconsin. Mr. McLean goes to some pains to score the non-resident shooters, who constitute a good portion of the membership of the leading Wisconsin ducking clubs. There is some justice in his charge in regard to non-resident spring shooting in Wisconsin, supposedly on the deep water ducks only. I take pleasure in corroborating Mr. McLean's statement in regard to one practical example of the wisdom of stopping spring shooting. On the Harrison marsh, of that State, no spring shooting is allowed by the club members, and in the fall there are many more birds to be found on that marsh than on any where there has been duck shooting in the spring. We cannot hope for spring restriction in Illinois, but it is within hope that we shall see spring prohibition enforced in Michigan, Wisconsin and Minnesota within the next few years. For those who like a somewhat warm statement on the matter we might offer some of Mr. McLean's remarks:

"Is it not a fact that these non-resident club members are about this time down on the Illinois and Sangamon rivers, in Illinois, and the large duck marshes in Indiana, comfortably quartered in fine club houses awaiting the arrival of the aquatic bird? What are they doing there? Mr. Meyer may infer that they are there for the purpose of driving the birds away from the resident shooters, who may not be so fortunate as to be able to support a club house or game preserve, to the boundary line of this State, where the birds are to be protected by the passage of an act now before our Legislature in the interests of these gentlemen."

"Is it not the fact that these non-resident club members are down there for the sole purpose of shooting every duck in sight, and when the flight moves into our State, do not these gentlemen come to their Wisconsin club house, and remain with us until the latter part of April, or until every duck has been driven from the State?"

"When the open season in September comes around, do you not notice the absence of these non-resident mem-

bers at the Wisconsin clubs? Where have they gone? To Minnesota and Dakota, of course, to assist in the further preservation of ducks in these States. I will ask you, why is it that on Lakes Winnebago, Koshkonong, Fox Lake, Poygan, Puckaway, and, in fact, every inland lake and river in the State, that we very rarely see a flock of ducks in the month of September, or until the Northern ducks come from their breeding marshes in Dakota, when during the few years that the ducks were protected in this State we had good September shooting?

"I may flatter myself somewhat by stating that I have had some experience in the matter of game protection in this State, as I am a resident member in good standing in more than one club in this State, where many of the members are non-residents, but I am sorry to say that too many of them are in favor of spring shooting simply for the reasons that I have already stated. "No use for fall shooting in Wisconsin. Dakota is the place to go, where we can kill ducks by the thousand." Now, but a very few of our Wisconsin members can avail themselves of this trip; they cannot afford it; consequently we stand around and look at our Illinois and Indiana members assist in preserving the ducks for us in the spring time, and in the fall months we take a crack at the few that get away from the secondary preservation in Minnesota and Dakota.

"I will give you a brief illustration as to the difference in game protection, and the open door or spring shooting folly. The Horicon Club, of which I am a member, is so fortunate as to be blessed with a constitution and by-laws that prohibit any of the members from hunting (for any purpose) upon the marsh in the spring time, under penalty of expulsion. They must not fire a gun before sunrise or after sunset. They cannot use any gun larger than ro-bore. We keep watchmen during the spring to see that the birds are in no way disturbed.

"Now, should one chance to come this way during the opening day, Sept. 1, I will guarantee to show him more mallard and teal ducks that have been bred upon this marsh than are bred in the balance of the State.

"In justice to this club I will say that it is under the control of the Wisconsin members.

"I am also a member of the famous (for spring shooting) Black Hawk Club, at Lake Koshkonong, the very best lake and marsh for breeding purposes of any in the State. The rules of the club will not prevent shooting in the spring nor at any time of day or night. He can use any size gun that he can load into a flat boat. He can go to any portion of the lake and do about as he pleases. He can fill the club house with all the worthless birds that he can manage to kill with his two heavy guns, and all that is required of him in return for this 'wide open' privilege is that he shall bury or in some other manner dispose of his dead birds.

"A few years ago I made a visit to this famous resort, and I must confess that I was compelled to hang my head in shame for the men who would deliberately go to their shooting blinds or flat boats and unmercifully slaughter from fifty to one hundred poor, miserable and worthless birds, that were so tired from their Southern flight that they would eagerly decoy to anything from a bootjack to a sawbuck."

Buffalo Specimen at the Stock Yard.

The finest mounted specimen of American bison I have ever seen—not the head, but the entire animal—is to be seen at a street place near the Union Stock Yards, in Chicago. I had never heard of this specimen and was much surprised to run across it this week. It has almost no defects, excepting that the horns have had brass knobs screwed on the tips. This was done before the animal was killed. But where do you suppose this big bull came from? Certainly from the last place one would naturally guess—Pike county, low down in the State of Illinois. I could not learn who it was who raised this bull, or where he got it, but there is no doubt that it was a splendid specimen, as photographs taken during life show very plainly. This bull was shipped to the stock yards four years ago and slaughtered there, when the hide was purchased by Mr. Backer and mounted for his place. Mr. Backer rather prides himself on his fine collection of heads and horns. He told me, however, that he would be willing to sell this mounted buffalo, as it takes up so much room. Here is a chance for some academy or institute. It is not easy in these days to get a perfect specimen of the American bison.

Sallie at the Show.

Speaking of the dog show reminds me of a conversation I heard this morning between Sallie and her mistress, the talk being from a standpoint perhaps not strictly professional.

"Mis' Mary Ellen," she said, "I declare to goodness I never was in such a place in all my born days! Such a-howlin' an' a-barkin', an' a-squealin' I never did hear! I was so 'fraid o' fleas I couldn't be right happy for a long time; I jes' lift' up one foot after the other, right high, when I walked down them alleys. They was all sorts of dogs, more'n I ever thought there was in the whole world. First thing I did, I goes and looks at them little fox dogs, same sort as Maudie is, you know, but law! I didn't see ary dog there ez good ez Maudie—lot o' no 'count dogs, somebody was a showin' off. They was a tryin' to sell them dogs, too, an' askin' all sorts o' money. I heard one man say one of them dogs sold for \$28, er else that was what they asked fer it, I don't know which. Then there was a white, bull sort o' dog that had a gold tooth—a man made him open his mouth and I took right hold of the tooth my own self; yes'm, 'deed I did. All them men was mighty good to me. Mr. Gould, he showed me round to all his St. Bernards, and I declare, Miss Mary Ellen, one of them there dogs was this high! (measuring about 6ft. on the wall).

"Then there was a dog that fit through the wah, and two little Japanese baby dogs that was borned over to Maniller, right on to Admiral Dewey's ship while he was a-ffin' the Spaniards. I didn't know whether I would rather have one of them, or the dog with the gold tooth. Then there was some little, low-down, chunky dogs, with their face all drawn in—bulldogs, was them, Miss Mary Ellen? They looked to me just like a' ole-time rusty nigger, too low and homely to be fitten to live! Then there was some more funny lookin' dogs, long, slim ones, with a long, sharp sort o' bill for a head—I

don't know what sort of dogs they was. In one place they had a whole row of right little, black, sawed-off dogs—weepin'-willow dogs, I reckon they call, for their hair hangs down just like a weepin' willow into a graveyard. They had monkeys, too, and a sort of show, like, where the monkeys and dogs sort of performed. I come away then, for some of them dogs didn't act nacherl. 'Deed, Mis' Mary Ellen, they was a-plenty of dogs there that didn't look nacherl, nohow; not to say like a real dog. Twenty-eight dollars for a dog—why, pshaw! they ain't no dog wuth that money! I'd rather have Maudie than any dog in the show, and she ain't worth more'n about \$3. But you ought to go there and see them dogs. The policeman at the door, he lets you right through, and all them men they show you the dogs. It was right fine, I tell you."

A Shootingless Shooting Trip.

We have all heard of the songs that were never sung and things of that sort. I am thinking of writing something about the shoots that were never shot. At least, I am but recently back from a shooting trip in the South, which was perhaps the most shootingless shooting trip that ever was. Mr. W. R. Sims, of Memphis, Tenn., writes to me under recent date with the purpose of communicating to me what he considers to be information not already in my possession. He says:

"I have some sad news to tell you about our mutual friend, Mr. Divine. He is at his old tricks again, borrowing fine dogs and losing them. I thought the 'exposure' you gave him some time ago would have cured him, or be a warning to all not to loan him their dogs. But you know what a persuasive tongue he has, and the nice promises he can make. One day last week he borrowed the best and finest pointers in the county for 'just one day's hunt,' but alas! for the owner, Mr. Divine came home with that same old tale, 'I lost him.' As good dogs are scarce, and in demand, he must have lost him for a good price. I never did get my dog he lost."

As I missed Mr. Sims during my brief visit at Memphis a couple of weeks ago, he perhaps may not know that I was *particeps criminis* in the loss of this last dog. Mr. Divine told me to come to Memphis and he would take me out shooting, saying that we could easily kill sixty or eighty birds apiece any day that we liked, and giving me also to understand that he had at his disposal a great many fine dogs. In this latter statement he was entirely correct, for without the least difficulty in the world he borrowed two fine dogs as one ever saw, a setter and a pointer. Perhaps I need not mention the names of the victims who owned these dogs. We brought the setter back. What Mr. Divine did with the pointer I never could tell, but I presume he tied him up somewhere out in the woods some time when I happened to be out of sight, and that the next day he went out and got him. I know we hunted all over the country to find the poor fellow, but were forced to go home without him. I thought it was safer to leave town about that time, so I deserted Memphis, and I have always been afraid to write Tom Divine since and ask him whether he ever returned the dog. I hope he did, and if he did not, I am in for half his value, for I was seen riding on the public streets with Mr. Divine, and with the two dogs in the carriage.

But leaving aside Mr. Divine's criminal practice, there were certain operative features to our hunt which entitle it to consideration. It is usually the custom to describe only those hunts which result in large bags of game, but you could carry all the game we got on this hunt in one coat pocket. The participants in the hunt were Mr. Divine and myself, with two Others, if the latter might be said to participate, when most of the time they were picking burrs from their skirts. It was expressly stipulated and agreed that the man who missed the first shot was to buy the dinners that night for the party. The first shot fell to myself, and as I kicked the bird up from under the dog's nose, I felt sure that the dinners would not be on me that time. I had in a load of No. 10 shot, which I had gotten from my friend, Mr. Bliss, over in Michigan last fall, and I was using my scatter gun, with which no man ought ever to miss a bird at all. This particular bird went off over a little gully, and I hit him very hard with the No. 10, so hard that he nearly went down at once, and I refrained from tucking in the second barrel. Yet the bird wobbled on and on, and finally dropped at the edge of a little thicket. Here we hunted, but could not find it! At this Mr. Divine loudly protested that I had lost the dinners. On the other hand I set up the claim that I had not missed the bird, but had killed it. We carried it up to the Supreme Court of the Others, who remanded the case for a new trial.

After a while the pointer made a nice point on a single in the woods. Mr. Divine told me to shoot, and as the bird rose, I again felt sure that I would not be lost at that dinner party. There was a sudden whirr, an agonizing pause, and a soft yielding feeling under my trigger finger! It is one of the peculiarities of my scatter gun that it does not always cock when you open it, the old lady being whimsical in this regard, this was one of the times when she went on strike. In my surprise I forgot again to use the second barrel, and the bird sailed off unhurt. Again we referred the case to the supreme court, Mr. Divine claiming that I had missed, and I claiming that I had not shot. This time the decision was against me, but Mr. Divine was asked to take the next shot. In a few moments he put up a bird and fired twice at it as it crossed through the woods, the bird passing on apparently untouched. I said ha! ha! to Mr. Divine in a loud and harsh manner. All at once there arose excited callings from beyond the wood at the foot of the hill, where we had left our colored boy with the carriage.

"I reckon I've killed the nigger," said Tom; "but that's a heap better than not killing anything, the way you do." We went on over toward where the boy was calling, and he pointed to a spot where he said he thought a bird had fallen dead. Sure enough, the dog pointed, and we picked up the bird stone dead! I protested that there was no proof that Mr. Divine had killed this bird, and pointed out that it might have been the bird which rose before me, and which had later dropped dead, either through fright or perhaps through its Southern courtesy. The supreme court ruled against me, however, and I had to buy the dinners that night. This was pretty much all the story. Awhile later

I put up a bevy, and killed one bird all by myself. We marked the singles badly, but approaching one it rose wild and I knocked it down with a long shot. As the dog went to retrieve, a bird rose in front of him and Mr. Divine killed it nicely, but we never got my bird, and concluded that it had got up again and was the one Mr. Divine killed. This ended our hunt, net results three quail, and this was all the shooting I did on my shooting trip of a week. Shortly after this we lost the pointer, and a little after 2 o'clock left the fields. Mr. Divine said he had walked all he wanted to, and didn't believe in walking anyhow. So we took it out in just enjoying the sunshine and the warmth, and the Southern scenes, which were so new to at least one of the Others. A party of negroes who were hunting rabbits along the grassy gullies gave us plenty of amusement. We drove in from our hunt in a leisurely way and that night I settled for the dinners. They were good ones, too.

I proved to my own satisfaction that a shooting trip can be a great success without any shooting in it. Indeed, I took great comfort in lying in my room at the hotel and looking out at the squirrels playing in the beautiful little Memphis park. At last, with one of the Others, who was present at the hunt, I folded my knapsack and slipped still further South, landing in dear old New Orleans, quaintest and most lovable of all American cities. Here we spent some delightful days in plain sight-seeing, most of our time being spent in the pawnshops and graveyards, which, as is well known, are among the main attractions of that city. I should not omit to mention certain angling features connected with this sporting trip. New Orleans, of course, everyone knows, is a great fish market. We saw all sorts of fish in the old French market, and ate all sorts of fish in the many excellent restaurants which we discovered. The pompano of New Orleans is a dream, the red snapper is a reverie, and the tenderloin of trout is pure and delicate imagination. The oysters are beyond description. I was disappointed in only one regard in these sporting investigations at New Orleans. At one of the old-restaurants the menu said that one might have oysters from Bayou Cook, or oysters from Bayou Cypriani, the price in either case being the low one of 15 cents for a dozen, and each oyster, as it proved, being as big as one's hand. "Which one is best, garcon?" I asked in my choicest French (for *ici l'on parle Francais* a good deal of the time). The waiter shrugged a most expressive shrug, evidently having sized us up for pilgrims.

"Bayou Cook, Bayou Cyprian'," he said; "two time on ze print, all same oyst'." By which I presume he meant to say that they were the same oyster under different names! Anyhow, they were very good. Everything in New Orleans is very good. It was very good of our friend of earlier bear hunts, Mr. R. W. Foster, to show us to the depot, as we left, though he was at the time ill himself.

Yes, this was about all the fishing we had at New Orleans. But we had a great many other things, from genuine sugar house molasses up. And the ride through the great sugar plantations was, as ever, a continuous pleasure. A great and wondrous country, this of the South, and much worth visiting, even though one confine himself to the ride in the sunshine, the encounter with the "oyst'" of Bayou Cook, or the matutinal visit to the pawnshop of Rue Royale, eking this out with an awed look into the sawdust precinct of the "Old Absinthe House," where there ought to be some gruesome scenes, but where I am told there never are any.

One should not visit the South and come away without seeing all the Southern friends he ever knew. Thus we wanted sadly to call on Dr. Taylor and family, over at Brownsville, a little way from Memphis; but time grew short, so I had to compromise by telephoning over to the Doctor; and had I not been forty miles away from him I am sure I could not have resisted the importunity of his pleading to come over and have "just one day's hunt" with him. And surely I must do this some time, for a better host or a better hunt never might be found.

And there was Capt. Bobo, Bobo the bear hunter, whom I have ruined in the bear hunting business, and who ought never to forgive me, but who does. We wrote to Bobo at his place, and said we would call, but again time grew short, and we did not hear from him. Yet, lo! on the very last day of our stay at Memphis, who should come into the café and sit down at arm's length from us but Bobo himself, looking just the same and talking just the same as ever. This was sheer good fortune, for he had but that day got our letter at his plantation, ninety miles away. The best we could do with Bobo was to promise to come again. He says he might maybe squeeze out one little, measly, small, poor bear if I should be out of meat. And Bobo promises to come North to see me this spring. All these Southern folk promise to come to see you, but they don't come. They seem to want the balance of courtesy always on their side the house, which is the one thing that can be urged against them.

Thus ended my shootingless shooting trip, but I couldn't say when I ever had a better. Noel Money will see this sometime, over in Siberia, somewhere, where he has gone and never kept his promises to write. Mr. Money will be glad to hear that his friends in the South are well, and that Capt. Bobo has got, at his house east of Memphis, the big set of bear tusks which Noel wants to put in the head of a walking stick. And he has also the curiosity of the claw of a bear, which is white instead of black, it being rarely that the black bear has a white claw. These things Noel Money can have if he will write as a decent fellow should, and tell us where to send them. He may also reflect with gratification, remembering the loss of his own dog at Memphis under suspicious circumstances, that he is not the only victim of his friend Divine's duplicity in dogs. Mr. Divine is old enough to mend his ways, but I am losing hope about him.

North American Birds.

Mr. Ruthven Deane, no doubt Chicago's most distinguished ornithologist, mails me the report of the A. O. U. committee on protection of North American birds, asking mention in the FOREST AND STREAM if possible. The report covers many interesting matters from all the States of the Union, North and South. One matter, from Mr. Mackay's report from Massachusetts, seems to me

to be of especial interest to Western shooters. Mr. Mackay writes:

"I would again call attention to the shooting and shipment East in the spring of certain birds, and strongly appeal to our Western friends to make some endeavor to prevent it if possible, in the case of the American golden plovers, Eskimo curlews and Batramian sandpipers. These birds are permitted to be sold in Massachusetts during the closed season provided they have been taken out of the State. I have tried very hard to prevent such sale here, but without success. These birds are killed in the West and Southwest during the spring while on their way to the breeding grounds. It is a common occurrence to take eggs from the females when cleaning them. Unless protective laws are enacted in the West little can be hoped for in Massachusetts, and it will not be long before these birds will disappear on our coast except as stragglers. In fact, judging from a number of years past in Massachusetts, such conditions have already been reached. Nebraska, Missouri and Texas (Fort Worth) appear to be the principal shipping points."

Our Western game bird are shot at practically all seasons for the Massachusetts game market which is open the year round. If Mr. Mackay can suggest and carry through a measure which will even partially restrict the Boston game market, he will receive the thanks of every sportsman and bird lover who resides west of the Alleghenies.

E. HOUGH.

1200 BOYCE BUILDING, Chicago, Ill.

Maine Game Interests.

BOSTON, March 13.—So far as it is possible to obtain information at this writing, what may be termed the Maine Commissioners' fish and game bill has passed the Legislature of that State. Its passage through the Senate was unobstructed, while I am informed that it met with no serious change in the House. Doubtless it now only awaits the approval of the Governor, and this it will get without any doubt. The principal changes are that all ice-fishing will be illegal in the counties of Oxford, Franklin, Somerset and Kennebec, instead of the inhabitants of the State being allowed to fish through the ice after Feb. 1, as formerly. The open season will begin, under the new law, as soon as the lakes and ponds are clear of ice, instead of May 1, as formerly. This change seems to have been necessary in order to take care of Sebago and other lakes and ponds in the southerly portions of the State, where the ice usually clears by the middle of April, whereas, in the backwoods and northerly portions of the State, the clearing of the ice is not much before the middle of May.

In the game laws the principal changes are in the clauses which will permit of a deer being sent home by the lucky hunter without his accompanying it by paying \$2 to the State for the privilege. For sending home a moose the State will require \$4 and for a pair of game birds or rabbits of fish a fee is also established, though I understand that some change has been made here since the first draught of the bill. The special change in the game laws providing that camp owners and campers may take one deer in September by paying a fee to the State of \$6, if a non-resident, and \$4 if a resident, has gone through. I have suggested to the commissioners that this will open shooting in September to everybody, from the fact that the taking of a deer is not so easy as it might seem, and while the camp proprietor is the holder of a license the whole party, guides and all, can be set to work after that deer. The commissioners say that as soon as they find that the privileges of the law are abused in any such a manner they shall immediately take away the privilege from that camp proprietor, and he will get no more. Another important change is the closing of the open season on deer Dec. 15, instead of Jan. 1. Caribou are put under complete protection of the law for six years. The punishment for illegal moose killing has been made fine or imprisonment, or both, at the option of the judge.

SPECIAL.

Sportsmen's Show of 1900.

NATIONAL SPORTSMEN'S ASSOCIATION, 280 Broadway, New York City, March 11.—*Editor Forest and Stream:* Congratulations are still pouring in on the management of the Sportsmen's Show, now in progress, as being the best show ever held in the Madison Square Garden, and it is certainly most gratifying to those whose earnest efforts have brought to a successful issue this grand exhibition, and the management, having this opportunity, wish to extend their compliments to the exhibitors and those who have been in any way connected in bringing about this grand result.

It is with pleasure that the management, in behalf of the National Sportsmen's Association, announce that the Sixth Annual Sportsmen's Show will open in Madison Square Garden, New York city, N. Y., March 1, 1900.

J. A. H. DRESSEL, Sec'y-Treas. and Gen. Mgr.

New Hampshire Deer.

CAPE VINCENT, N. Y., March 8.—*Editor Forest and Stream:* Perhaps some of your readers would be glad to know that the "close season" law is beginning to bear fruit in New Hampshire. On a farm which I have the misfortune to own, in the town of Dublin, in that State, the deer are so tame that they come down in broad daylight to feed on the lily pads in a marshy meadow in front of the farmhouse. I use the word tame "advisedly," for the deer have lost so much of what we have come to consider their natural shyness that they will let a person approach almost within a stone's throw and watch them feeding for an hour or more at a time. The farmers are thinking now that their grain fields will be in danger if the deer get much tamer.

LIVINGSTON STONE.

The Old Trapper.

Editor Forest and Stream:

Mr. James Buckham truly says, in his delightful sketch on the old trapper, published in last week's FOREST AND STREAM, that "you will scarcely find a village or a town * * * that has not its representative old trapper." In

my native village, Dansville, N. Y. there were a number of such old characters that excited my admiration in boyhood days. Chief among these was Bob Nicholson, the old fox hunter. I well remember him as a man something above the medium height, spare figure, long, curly white hair, and blue eyes, with an indescribably sad expression. In youth he must have been a handsome man, and his old age still preserved those lineaments to a great extent. He was slow and dignified of step, and always seemed to be absorbed in deep thought. Shy and taciturn, in many respects he was a mystery to us boys, all efforts to draw out some of his boundless store of reminiscences proving unsuccessful. But, oh, how we envied his freedom from all restraint, especially when we contemplated that while we were obliged to be absorbed in irksome studies in school, he, on the other hand, could range the hills in pursuit of the wild creatures! Just to see the old hunter start out for a day's hunt, with his rifle under his arm, and accompanied by his sad-faced old hound, was a sight that haunted us for many a day. How often have I heard the crack of his rifle and the music of his hound echoing among the pines on East Hill! While fox-hunting seemed to be his greatest delight, still, all seasons had special charm for him. I have often met him returning from trout expeditions, and on one occasion, when I was in pursuit of trailing arbutus, and nearing a favorite haunt of the fragrant wood blooms, I found the old hunter there before me gathering the choicest pink clusters. When nature finally called him to her bosom, we all recognized that the village had lost a most picturesque figure.

SPRINGFIELD, Ill., March 5.

Shooting from the Hip.

ST. AUGUSTINE, Fla.—*Editor Forest and Stream:* One swallow doesn't make a summer, and if my friend Jacobstaff knows not only one, but one hundred cases of men who violate all orthodox rules of sportsmanship, it would not be proof that I am wrong in my assertion that shooting from the hip is not the proper thing.

If it is, our old world is inconceivably stupid in not having found it out before.

I don't assert that the thing cannot be done, for there are wizards of the Carver stamp who can do almost anything—even to breaking glass balls over their shoulder with a rifle, but it would not be sportsmanlike, nor respectful to the bird to turn your back on him when he gets up, merely for the sake of spotting him in that way.

I started out in opposition to a Southern writer, who expressed surprise that Northern shooters did not generally adopt a thing that not one in a thousand could even acquire. If our pigeon slaughterers ever succumb to my good friends' powerful arguments, and get up a hip match "may I be there to see," and if I feel disposed to gamble I shall go with a pocket full of rocks. "But why should I run on so garrulously on so palpable a thing?" If my friend will pardon me this time, I'll try in future to write on subjects on which I'm "better posted."

DIDYMUS.

PHILADELPHIA.—*Editor Forest and Stream:* I have been interested in the notes on hip-shooting; and I would like to ask Didymus (who does not believe in the hip aim) if this is not a style commonly adopted by the Seminoles. I remember seeing some of the Indians shoot from the hip, when I was in south Florida in '95, and I then was told, or got the notion, that it was a quite common mode with them.

L. A. CHILDRESS.

Reason, Instinct, or What?

WHILE reading Mr. Fred Mather's article entitled "Reason and Instinct," which appeared in a recent issue of FOREST AND STREAM, I was reminded of an interesting experience of my own, which happened only a few years ago—an experience which led me to wonder whether animal action could always be accounted for on the ground of instinct or even reason. Rat stories are by no means rare, and one never hesitates to contribute one's own private tale to the common pile, but in view of what Mr. Mather has to say on the subject of animal intelligence, I can't refrain from relating my little yarn, in the hope that Mr. Mather or perhaps some one else who knows more about the subject than I do, will be able to enlighten me as to the brain processes which controlled the strange actions of my particular rat.

It was in the spring of '95. While returning late one night to my room in the school where I was then engaged as a teacher, I noticed a large brown rat sitting quietly at the head of the stairway, just outside of my door. He appeared quite tame, for it was not until I had almost reached the top stair that he dropped on to his four feet and jogged leisurely into the room, where he disappeared down a hole beneath the set basin in the corner. I gave the creature no second thought, and turned in for the night. My sleep had not been of long duration when I was awakened by a racket in the room. At first I was unable to make out just what it was. As my sleep-begoggled mind began to regain its reasoning powers I discovered that my friend of the earlier evening had returned and was evidently playing "tag" with himself all over my room. First he went tearing across the floor, as though trying a rooys dash. Then he indulged in some high jumping, at which he proved an expert, for he had no difficulty in landing on the highest point of every article of furniture in the room. Occasionally he would miss his mark and come down on the floor or bureau with a thud that fairly startled me. But the next moment he was up and at it again. Finally, from the sounds that reached me, I judged that he had improvised some hurdles and was making record-breaking time in that scientific and exciting sport. I was now thoroughly awake, and was beginning to get deeply interested in the proceedings, when there came a lull. For several moments I could hear no sound of my visitor. Evidently his training hours were over for that day. Just at that moment a rustle among the papers on the table at the foot of my bed caught my ear. I turned my eyes in the direction of the sound. A patch of light from the arc light across the street fell on the table, and grad-

ually I detected the form of my athletic friend seated on the table, apparently resting from his exertions. While I was wondering what he would do next, he set my mind at rest by trying a broad jump, which landed him squarely on the spread at the foot of the bed. That was getting a little too familiar, and a vigorous kick from my "No. 9" foot sent him hustling to the shelter of his hole by the water pipes.

Once more I felt myself sinking into sleep, when a now familiar noise startled me. My friend had returned. I opened my eyes and listened. The same programme as before was repeated. Up and down the room he dashed, banging his head against the wall so hard at times that I was sure I could find the dents there in the morning. The next moment he had mounted a tall old-fashioned clock, and from the sound that followed, he must have made the floor in one leap. So he went on for at least ten minutes, and then, followed as before a period of rest. The last sounds that came from him were down near the wash-stand, on the further side of the room; but he had not yet appeared on the table. While I lay wondering what would be his next move, I heard him get under way again. He started leisurely from the wash-stand, following the wall on the other side of the room. I could hear him under my desk, then under the clock, then the bureau, then he turned the corner, and passing beneath the radiator near the head of my bed, proceeded to wind his way beneath me till he reached his old location. I watched him climb leisurely up on to the table, though the hazy light prevented me from following his movements for the next few moments. Evidently he was forming his plans for the next move. This came suddenly, in the form of another jump, which, as before, landed him on the foot of my bed. Again my feet got in some rapid and effective work, and after a stay only a little more prolonged than the first one, he slipped off on to the floor and disappeared in his old retreat.

By this time, I was indeed getting interested, and having made up my mind from his antics that the creature was either starved or crazy, I decided that I would be justified in an attempt to get rid of him. Procuring a few crackers from my bureau drawer, I spread them on the floor at the side of the bed, where I could get a good view of my visitor, should he attempt to make away with them. Then I secured a heavy cane, which I placed on the spread beside me. Thus prepared, I got back into bed and awaited developments.

A longer period of quiet ensued this time, but at length the well-known sounds began again. As usual, all the events that appear in ordinary track and field athletics, were indulged in, and so far as I could judge, a few also with which I was not familiar. Before my reckless acrobat had finished his repertoire, I had fully decided that he was either afflicted with a violent type of insanity or else, like "Micky Brannigan's Pup," "twas the Devil himself in disguise." So I kept a firm grasp on my cane, and strained my eyes as hard as I could in my efforts to follow him in his mad career. But as before, his wind at length gave out, and the usual period of tranquility followed. I kept my eyes strained on the table at the foot of the bed, but no sign of my friend could I see. The crackers too remained unmolested, and I grew anxious. If my weird visitor was planning another assault on my bed I at least wanted to know from what quarter the assault was to come. While I was thus speculating as to his whereabouts, I happened to glance in the direction of the clock across the room, and as I did so I spied the object of my search. In front of the clock was a rocking-chair, on which I always piled at night several sofa pillows that by day adorned the bed. Resting calmly on top of these cushions sat my friend, watching me all the time, and gathering strength and courage for his next move. For several moments we eyed each other. Then without warning he leaped for the bed. He landed near the foot, but the warm reception that met him in the shape of vigorous kicks and cane whacks was evidently unexpected. For a moment he hesitated, then turned and fled.

Now I am not by nature superstitious, but the thing was beginning to get a little uncanny, and I didn't relish it. If the creature was hungry, why did he not partake of the repast I had prepared for him? On the other hand, what possible motive could he have for tearing around the room in such a reckless and insane fashion if he was sound in his upper story? Only two possible solutions of the mystery presented themselves to my mind. Either he was actually unbalanced mentally or else he was a "spook" of some kind with designs on my life. His next move led me to believe that the latter explanation was the correct one.

Fully an hour elapsed before any further developments occurred. I had almost deluded myself into believing that I was at last to be left to a peaceful time of rest before morning appeared. But how vain are man's hopes! Scratch, scratch, came from beneath the wash-stand. Instantly all thoughts of sleep left me, and I grasped my weapon of defense more firmly and waited for the usual performance to begin. But I was disappointed. My assailant had more important business on hand this time. I heard him start on his journey around the room, following the same old path. He scurried along the floor under my bed, and in the dim morning light, which was just beginning to stream in through my window. I could make out his gaunt form as he climbed up on to the table once more. There he sat watching me, as before, and planning for the coming attack. Through the iron bars of the beadstead we eyed each other in silence, and measured our chances of success. Darkness was his strongest ally, and he could not afford to delay. Calculating his distance well he sprang for the bed. Kicks and blows rained about and on him as he landed, but he had sized up the situation beforehand, and the next instant had dashed up the bed straight for my head, where kicks and blows could not reach him. Discovering his game, I dropped my cane and began a fierce hand-to-hand conflict with the foe. Over my chest, neck, shoulders and head he ran, while I pounded, slapped and squirmed in my endeavors to shake him off. But he did not propose to be beaten this time. It was to be a fight to the finish. The next moment my blood turned cold as I felt him down under the sheet and on my chest. I made one wild, desperate grab for him, and fortune directed my aim. I felt my fingers around his warm body, and all

the muscular energy I had in me went into that clutch. He squealed and kicked and squirmed as I rained blow after blow with my fist on his head. At last his efforts grew feeble, and it was none too soon, for my strength was giving out. But still I pounded in a dreamy mechanical way. He was now quite still, and I could feel his warm blood on my hand, but I did not propose to take any chances. Still clutching his limp body, I rolled out of bed, and taking my cane, proceeded to mash his head into jelly. It was only when sheer exhaustion overcame me that I stopped. Life had long ago left him, that was sure. But even if he was an incarnation of the devil, I did not propose to lose any more sleep that night, and so the mangled and battered corpse was locked up in a strong wooden box to await the morning and to bear witness to the truth of my tale, which I felt sure would not be believed by itself. It was as I had expected, but a glance at the blood-soaked sheets and the mangled form of my would-be destroyer served to convert even the most skeptical. The story has now become a school tradition, and the luckless mortal who happens to be assigned that famous room is always waited on by a delegation whose duty it is to make him feel perfectly at home by relating what once happened to a former occupant.

A. E. STEARNS.

ANDOVER, MASS.

Sea and River Fishing.

Proprietors of fishing and hunting resorts will find it profitable to advertise them in *FOREST AND STREAM*.

A Summer at Seabreeze.

OUR summer at Seabreeze, on the east coast of Florida, was a pleasant one. We went over there in May. The vicinity of the ocean was indicated while we were yet miles away by the bent-over forests, in which each tree trunk has been sprung into a curve leaning from the coast by prevailing winds during the stormy seasons, a result I never noticed elsewhere near the Atlantic border. Our first glimpse of the ocean off Seabreeze was through a depression at the termination of the main street between side banks covered with silver palmettos that made a pretty framing for the picture beyond of wide beach, white surf, and miles of turbulent blue water. Our cottage, which was a few rods to the right of the main street, was shaped like a V, with legs expanded seaward. An upper and a lower veranda, that might have been quarters of a wooden pie, more than filled the angle. While sitting on these and watching the surf, we often felt as if we were on the stern of a steamer with somewhat of a wake behind it. An average tide did not come within 150 yds. of our front steps, but one of extreme height came to the bluff only 10 yds from them.

We spent much of our time out front entertained by what we saw on the beach or out at sea. Often the coast was a thing of wheels. On rare occasions, when it was deserted, trick riders performed for our sole amusement. Day after day bathers bathed and fishermen fished, all of them tumbled and tossed by the surf. Waves like large aprons with white frills would rush in for a while to tear up along shore. These would often be followed by a period of immense rollers that pounded and roared in lines of high breakers. At times the water beyond the surf would be a vivid blue; at others as green as young wheat; and at others any one of a number of delicate tints; and the fish, large and small, tarpon and small fry, sought the pretty color spots to dance on.

The miles of coast in sight formed a straight line. As the wind, for some cause, was either up or down this coast a great part of the time, swift currents had formed inshore channels that became dangerous places where the water swept out to sea and promising holes for fish where the trend was toward the beach. The topography of the bottom was changed, too, by extreme tides and pounding storms; but I easily learned it again by making long casts and then keeping abreast of my hook in the wash of the current. Channels where the outward flow carried line from my reel were considered by me places to be avoided. Days when there were no currents were the best for fishing.

There was good fishing four miles up the coast, where a three-masted schooner had washed ashore stern first with bow far out among the breakers. Long strings of small fish were taken from the hold and great bunches of large fish were caught from the forward deck among the breakers. The forecabin was used frequently as shelter either from passing showers or from the rays of a burning sun. This grand old ship, the Nathan Cobb, after years of cruising, may be to all parts of the world, when she saw that her days of sailing were to end, had settled herself on shore exactly where she would be most useful to man to the last moment of her dissolution, a commendable deed that led us to esteem her as a faithful friend. The fish caught up there were "whiting," weak fighters, not unlike the white suckers of Northern streams, but their flesh made delicious food. As better tackle was unnecessary for such sluggards, stout bamboo rods and coarse lines were used. While we fished unusual waves broke against the bow and sprayed us, the aspect of the ocean changed many times, fish-hawks dropped every moment into the broad belt of surf along shore in sight, eagles came over the green hills of the peninsula to rob the hawks and at times to venture plunging into the sea—we had more amusement than the sport up there.

Most of the fishing, however, was done directly in front of our cottage. Nearly every day there was a sturdy line of bounding fishermen out neck deep struggling with the breakers and fish. Each sport wore a large straw hat. When extended in long rows they were not unlike some of the inner parts of a piano. Oblique waves caused the hats to bound successively as if scales were being run. Waves parallel to the coast resulted in a simultaneous upward move of hats as if a grand "prelude" had been struck. Choppy seas and fast running waves often brought about the wildest confusion of scattered hats and pathetically struggling feet as if some enormous Paderewski

had hold of this human piano and was doing his worst for it. Fishing in the surf had peculiarities of its own. I never tired of watching those hats.

A man from the interior of the State moved into the cottage next door soon after we arrived. From some source he had received an impression that I knew all about the salt water fishing, a fallacious belief which I encouraged, and it was not long before he made overtures for me to show him around. He mentioned an assortment of tackle which he thought might be useful to us, and offered to furnish the necessary bait. We went.

Neighbor had not brought a bathing suit with him, so he costumed his person in shirt and overalls. As the latter were 8 or 10 in. too long for him they protected his feet from the blistering sand above high-tide. He was a veteran of the Civil War, and their bright blue color gave him rather a soldierly appearance. It was something of an honor to introduce my hero-like friend to the breakers.

For awhile my pupil listened patiently to warnings in regard to dangerous currents and to instructions about the proper way to fish. He did not become obstreperous till he saw that he was catching the larger share of our fish. Success spoiled him. He would march ashore with each fish, his head set, his eyes shining, and the surplus of blue trousers beyond his toes fluttering wildly as he walked. I thought it an unnecessary display of vanity. Perhaps my ill success made me envious.

We gradually worked our way down the beach. It was rather unpleasant out in the ocean chin deep, nearly, hopping at every incoming wave to keep mouth above water and performing athletic leaps at the approach of a large "curler." Some times we had to dive to escape annihilation, then search widely for hat and rod when we came up. So much exertion and the steady pounding of the waves were exhausting. I found sufficient amusement near shore, where the breakers were less violent; but my friend ventured further and further out, heedless of my warnings. I might as well have called to the porpoises to come ashore. Perhaps that chap felt as if he knew as much as these lumbering fish concerning the ocean. At last an immense wave rolled in. It really towered up sky high. I could have counted 150 while my friend was extracting his feet from the air. His trouser legs meanwhile were like two blue signals of distress shaken violently. It was some time before he would venture out to recover his hat and rod. From then on he was more docile. He was quite upset by his mishap; but a surf fisherman must expect such reverses.

Very few sea bass were caught during the summer. The whiting were plentiful. The latter were the prey of the "fish hog." Morning after morning specimens of this creature wandered over to the beach with rods to fish the ocean out; night after night they tried to distribute their loads among the residents along the bluff. Some of them even tried to sell whiting, as if it was not a kindness for us to accept their fish as a gift. It must have been discouraging, though, to the man who wanted to catch everything to fish the surf so often and discover each time that the sport was just as good as ever. Why some of his kind did not give up trying or perish of vexation was more than I could understand.

Some of the fishermen contrived subterfuges with which to overcome the surf difficulties. A few of them built four-legged pyramids 8 or 10 ft. high, with seats on top. Such affairs swayed like immense rockers out in the surf. The largest waves would knock these perches over and cause occupants to dodge for life to escape such dangerous drift. Floating timbers were cast ashore by the wash of breakers with terrific impetus. Four sportsmen brought out two immense trestles and lashed a cross-board to them. The perch up there was high and rather precarious. The trestles cavorted and plunged as if frightened horses. It must have been difficult to maintain an equilibrium on a seat of that sort. The rollers were thoroughly aroused. Each wave reached for that board. At last one caught it and overthrew the entire outfit. For an instant everybody near was in flight to escape death from wreckage. Such new ideas were all right for those who wanted to try them; but standing up against the breakers in the usual way was fishing enough for me.

But I tried a different method on one occasion. Masses of leaping fish out at sea tempted me out there in my canoe—the Field's craft. The flow of the surf had been carefully studied and a plan to obviate danger had been decided upon. I experimented one afternoon, when there was only a single line of breakers. A number of passages were made through this without mishap. But it was rather disconcerting to find that the eruption occurred at times near shore and at others far out. I soon discovered that I must take the wash end-on to avoid a catastrophe—knowledge that was useful to me later.

I tried my luck a few mornings afterward. There were two lines of breakers when I went out. The first of these was passed safely by hard paddling at the right moment; the second by pausing an instant for a roller to crash in front and then urging my canoe ahead. Either through my tactics or the aid of a kind providence I reached safe water, where there were only large swells. Once my canoe had stood nearly on end, with bow pointed at a feathery cloud near the zenith.

Much paddling was required to go only a short way seaward. Long distances became insignificant in such an expanse of water. The canoe headed up one side of the large swells and down the other, much as if constantly leaping a single spot in the ocean. From a mile out the town of Seabreeze, on the bluff, had an unfamiliar appearance. Sometimes I saw it from the crest of a very high wave; at others I hid from it in private deep valleys of my own.

Besides the regular ocean swells, cross-seas had been raised by a side wind, and the combination gave my canoe the erratic motion of an agitated corn-popper. Soon I had a bursting headache and a severe pain in the region of my stomach, as if I had been dealt a hard blow there. Other saltwater fishing had not been like this.

My coming in through the breakers was all wrong. There were four distinct lines. I paused at the outer one of these till a large wave broke, and then tried to follow the wash in. Though my pursuit was terrific, I could not overtake that escaping mass. On the way in at least

a dozen old-time breakers, all of them larger than houses, broke around me. There were precipices to look over and precipices to look up at. That 200 yds. toboggan slide through a snow of surf was lightning. For a single instant my canoe had swerved, to be righted by frantic back-jerks on the opposite side with paddle. I crashed up on the beach with the hair of my head erect. For a few minutes nervous exhaustion prevented me from disembarking. But I had brought my canvas canoe, built after a plan suggested by Parker B. Field, through all that wild surf astern without mishap. There was less than a cup of water in it when I reached shore.

I had caught very few fish, so after landing I dug coquinas, clams as small as grains of corn. Great areas of these could always be found imbedded in stratas along the beach between tide marks. Profitable soil was washed in the surf for these clams. Cullenders, sieves, tin pans, anything that would hold coquinas, were used. It was like washing for gold. One citizen had built a cylinder 2 ft. in diameter and 4 ft. long to fill with beach sand and then haul through the surf with a horse. Coquinas were popular. Several quarts of them, if washed in fresh water and then covered with it, after boiling for ten minutes, shells and all, yielded a supply of juice that made a delicious pot of soup for a large family.

Some days we had shrimp, or prawn, served in abundance. The local variety measured from 4 to 6 in. in length. I had overcome a prejudice against them formed years ago because of their resemblance to the crystalis left by a young locust, and found that their tender flesh was far more delicious than the meat of lobster or crab.

The ocean was kind to us. It supplied us with so much good food. Not only that, but it was also such a delightful companion. It washed the smoothest sort of path for our wheels, and dug holes near shore for us to fish in. It was sublime to look at under all conditions. We played with it. At times parties of us grown-up folks would build sand forts on the beach, and the ocean would reach out with tiny waves to level them. When we went out to bathe it would toss us high, as if we were little children. Some times it would be rough and would stand us on our heads to catch our wandering feet afterward and sling us at the beach.

There were days when the ocean carried on a hot weather conversation with the bluff; and there were other days when it was decidedly out of humor and not fit to hear. Its voice always cheered us on at our meals, sung to us through the day, and lulled us to sleep with lullabies when we woke up at night. Every window of our cottage gave a view of the ocean, and stormy days I wished for eyes enough to look out all of them. We were fascinated by the turbulent Atlantic. We feared it and yet exulted in having it so near us. It was a great life, of which each one of us seemed to be an infinitesimal part.

Forests and Trout Streams.—II.

Editor *Forest and Stream*:

I send you the substance of an article read before the annual meeting of the Minnesota State Forestry Association, by Frank H. Carleton, of Minneapolis.—Geo. W. STRAND, Secy.

ONE of the sources of food for fish in the beautiful lakes and streams of Minnesota are the crustacea, or small shellfish, which once were so abundant on the sandy and pebbly bottoms of lake and river beds, but the great freshets, by bringing in the large quantities of rich soil from the land, have made a deposit of mud and ooze, which has destroyed the crustacea, and so another great source of food for fish has been destroyed, and the tiller of the soil and the angler have both been injured. The volume of water has been reduced not only by the evaporation and drying up of springs and other sources of water supply, of which we have spoken, consequent on forest destruction, but the water bed has been filled up from the bottom and rendered shallower. And can we wonder that our streams and lakes are growing shallower, and that some have ceased to exist altogether, when we consider that two factors tending to reduce the water supply are constantly at work on our lakes and streams at the same time, one to fill up from the bottom and the other to reduce the quantity of water at the surface.

Have any of you gentlemen ever waded a trout brook in a region where the trees have mostly been destroyed, as the once famous Kinnikinnick, whence so many trout were taken twenty years ago, and notice that the once deep holes have been mostly filled up with the deposits of soil from the neighboring fields, and that now the water for the twenty miles of its course is nearly of uniform shallowness, while once it had its great variety of shallow and deep places? Compare such a stream as this with its monotonously even depth of water with the few streams of northern Minnesota and Wisconsin where the axe-man has not felled the timber, and note the difference in the depth of the water bed. I have waded the Kinnikinnick for miles in my hip boots without once getting out of the water or even getting in over my boot tops, while in forest streams of northern Minnesota or Wisconsin of half the volume of water I have been forced to get out of the water every few rods on account of the impassably deep holes. I was always willing to get out, for in these deep holes we get the trout. But a few more years of forest destruction in Minnesota and Wisconsin will soon cause the deep holes in the streams to be filled up and the trout will disappear rapidly enough.

It is a conceded fact that a treeless country, whenever it has rains, has freshets and inundations. Without forests to hold back the water it at once runs off in torrents, filling the streams more than bank high, and with its resistless current sweeping spawn and young fish away from their habitats, leaving many on the shore to perish with the receding waters and carrying others to the larger lakes and rivers, where they are readily devoured by the larger fish. One sweeping freshet in a trout brook will often work such serious loss to the spawn and smaller trout as to seriously injure the fishing for years. And you know how the flooding of logging streams will in a few years almost exterminate the trout.

The diminution of the volume of water in our lakes consequent upon forest destruction also militates against the fish in two other very serious ways. First, as the water becomes shallower, often freezing nearly to the bottom, the fish have less freedom and air space be-

neath the ice in winter (for be it remembered all fish must have oxygen from the air) and many of them are frozen to death or suffocated; and second, as the waters of the lake diminish and it becomes shallower, the shore line, which is a great feeding ground for all fish at different seasons of the year, is greatly reduced, and their source of food is very materially diminished. As a rule small fish are usually found in small ponds and large fish in large bodies of water, the reason being that the limited shore line of small bodies of water does not yield the relative quantity of food contained in lakes having a large shore line, and consequently relatively larger feeding grounds. The best lake fishing is found in those lakes which abound in deep waters and which have a large shore line for feeding grounds, like Lake Minnetonka and Lobster Lake, in Douglas county. It is this fact which in the past made Minnetonka one of the very best fishing lakes that ever existed. But Minnetonka's glory as a fishing lake has departed, and will not return again until the Forestry Association's work of reforestation has been accomplished.

Again, forests and the trees and shrubs on the shores of streams and lakes are the favorite home of numberless flies and insects, and these, with each breeze, fall into the water and supply that insect food which fish most enjoy. We must remember that our better varieties of fish are not content with one variety of food throughout the year. Catfish, dogfish and reptiles may be the scavengers of the waters and swallow greedily whatever they can find, but our noblest fish, like trout, bass and pike, demand a variety of food and are often very select in their tastes. In the spring they may feed along the shore line of the water and on the bottom, but later in the season, when flies and insects appear, they want them. It is this love of fish for flies and insects which is the secret of fly-fishing, the acme of the angler's art. And this love of fish for flies and insects explains very largely the reason why the worm fishermen in the hot months of summer may wade the brook for hours with scarcely a bite, while at the same season of the year and out of the same water, the angler with his artificial fly delicately cast will in early morning or in the hour before sunset display a creel of speckled beauties. What angler is there who has not from a concealed spot watched the fish under the protection of some overshadowing tree jumping at the flies and insects as they fell into the water? And have not all of us caught our largest trout, the trout of which we boast and in the catching of which we made our record, under the shadow of trees or out from under a "cover" made by the trees or bushes? And not only this, but the trees make the shady and moist banks from whence come worms and grubs and under these mossy banks we know the fish are concealed ready to dart at their prey.

All know that the shade of overhanging trees is agreeable to the fish, and one need only to place a quantity of brush in a stream or lake and make a "cover" and see how quickly the fish make it a resort, to be convinced that fish like shade. What tyro does not know that a shady deep pool is a good fishing point? And what experienced fisherman is there who, when he goes upon a stream or pond does not almost invariably find that the fish have left the hot and unprotected shore and have taken to the shady side, and so he casts his worm or fly on the shady side.

It is a well-known fact that the best fishing is where a forest is near the shore, and, best of all, where the limbs overhang the water. Not only do the trees afford shelter, furnishing food and preventing evaporation, but at the same time they keep the water clear and cool in the summer. In winter the forests afford protection by lessening the severity of the winter frosts, and in all forest regions the changes of temperature are not so severe as in treeless countries and on the open plain; and the effect upon the water is even greater. It is a popular saying in Denmark of the forest streams that they are cool in the summer and warm in the winter as compared with the atmosphere. This truth is not confined to Denmark, for it is the experience of woodsmen everywhere.

Forests not only regulate the flow of water, but they purify it. This is an experience which has been demonstrated in Australia in cases where streams have been polluted by wool-washing establishments. After having passed a few miles through a shady and dense forest the water, according to Mr. Howitz, who was forester in Australia some years, appeared as clear and pure as it was above the wool wash.

In Scotland and other localities where salmon are bred after scientific methods, it has been clearly established that it is not enough to place spawn and fry in the waters, but that they must be provided with food, and that the best means to do this is to preserve the border trees and insure a steady supply of water and food by preserving the forests, from whence a supply of water and food is derived.

The changing of the temperature of the water of a lake or stream by the clearing away of trees and forests has a most deleterious effect on fish. As already stated, not only is the supply of food removed and the spring which should send forth a supply of clear, cool water in which fish so much delight dried up, but more than this, the direct rays of the sun upon the water in summer raise it to a temperature too warm for the abode of fish, while in winter the absence of trees causes an extreme of cold which is equally bad. If one of you gentlemen had a superb trout brook upon your premises, well stocked with trout and well protected by trees, and should ask the surest way to annihilate the trout, I could tell you no surer way than to cut down the trees and bushes. What few trout survived the loss of food and the warm rays of the sun and the warm water in summer, would readily be exterminated by the extreme cold of winter occasioned by the absence of trees. The higher breeds of fish, in which anglers most delight, like trout, salmon, bass, whitefish, pike and muscalonge, must have sufficient shade, depth, and coldness of water in which to live and breathe, and it is in the shade and cold water that the experienced angler hunts them.

Scientists tell us that the ranges of hills and uplands which we now have in Minnesota are the remnants of that mountain chain which once constituted the great divide between the water systems of the Mississippi, the Winnipeg and the Great Lakes, but which by erosion

and other natural forces, working through the ages, have become the highlands and hills of to-day. They also tell us that the lakes and streams of Minnesota have not only reached their maturity, but have passed it, and that under the laws of nature, saying nothing about the ravages which we have already suffered and must continue to suffer through forest destruction, that the tendency of these lakes and streams will be to still further decline. With this tendency of nature to reduce the quantity of water, by natural laws, over which we have no control, is it not a crime to ourselves and to future generations to permit the destruction of forests to go on, and thereby still further reduce the quantity of water and moisture and help on the train of evils which are sure to befall a rainless country? It has been truly said, that there are districts in France and Italy where the olive and the orange once flourished, but where now, on account of the change of climate resulting from extensive removal of the forests, they can no longer be grown with success. This saying involves an agricultural truth as to every country where forest destruction has gone on from the Euphrates to the Mississippi. And to anglers there is a parallel truth, which may be stated thus: There are vast districts in Minnesota Wisconsin and Michigan where fish of the noblest varieties once flourished, where, owing to the diminution of water at certain seasons of the year, and torrents and floods at other seasons of the year, occasioned by the removal of the forests, they have already disappeared, and other parts of these States are rapidly reaching the same condition.

My nearest neighbor, a prominent insurance man, whose early home was in Kentucky, tells me that in the early history of Kentucky its streams were full of trout, but as the land was cleared the trout disappeared, and that to-day, outside of a few private preserves, it is doubtful if a trout can be found in Kentucky, while in Virginia, of which Kentucky was originally a part, in those regions where, owing to the poverty of the soil and other reasons, the forests have not been cut, the trout still abound. Do we need a better illustration of the effects of forest destruction upon fishing than this?

Did time permit, I would like to speak of the vast quantities of money brought into a State by tourists, hunters and anglers, and tell how this money gradually works back to the pockets of our farmers, producers and merchants. I would like to tell how the mountains of New Hampshire, sterile as they are, have through summer months' tourists and visitors, proved a veritable Klondike to the citizens of New Hampshire, and brought into that little State millions of gold. Should the beautiful lakes and streams which center around the headwaters of the Mississippi and St. Croix prove less valuable?

To-day the State spends its money in the propagation of fish and in the stocking of lakes and streams; it has its fish and game laws and its fish and game wardens, and it imposes penalties for fishing and shooting during the closed season (and these laws are all good); but meanwhile the destruction of forests and its consequent evils go on. To use a homely phrase, it is like closing the spigot and opening the bung. To anglers the lesson is apparent that if they desire to preserve what fishing there is left in Minnesota they must join hands with the Forestry Association and help save the forests and rear new forests; for on the preservation of the old forests and the rearing of new forests do fish and fishing depend.

There is only one answer to the question, "How can we preserve the fish and fishing in the Northwest?" and that answer is by preserving the forests and by reforestation, and thereby putting in play again all those manifold influences of nature that can come from the forests. The propagation of fish in State hatcheries and the planting of them in our waters, the operation of fish laws and the acts of fish wardens, good as they are, nevertheless work only on a very small scale, and are ineffectual and futile as against the great evils of forest destruction. Only by the operation of those great laws of nature which come from forests can our fishing become and remain what it ought to be.

Salmon in Monroe County.

Editor Forest and Stream:

Touching the subject of salmon in the fresh waters of this State, it has occurred to me that very interesting facts would be brought to light if diligent search were made among the records of the pioneers who first settled in the territory adjacent to the waters which in old times were frequented by the king of fish. My own experience supports this view, for, while engaged a few years ago in compiling a history of this city, I had occasion to search for information regarding early times, among old publications, and came across many passages calculated to stir the blood in one who lives in a city but has a love for the woods and waters.

Within a hundred years panthers and bears have been shot in the woods of this county, and several of the towns were noted for the abundance of deer. The first settler at the mouth of the Genesee River seems to have had a grudge against the snake family, for it is recorded that on one occasion he alone killed forty rattlesnakes in one day along the river, and was one of a party that destroyed 300 of the reptiles during an expedition organized for the purpose.

The eggs of wild geese and ducks, which bred in the marshes of Irondequoit Bay and the ponds in Greece, were an important article of food to the pioneer. Beaver and otter were common in the waters, and one family of the first named remained in Braddock's Bay for a year or more after the first settler built his hut on its shore. There was until recently, if indeed it does not still exist, a beaver dam in the town of Greece, on a tributary to Braddock's Bay. Allan's Creek was fairly boiling with trout—one of the pioneer anglers said that you could "catch a hundred of them without changing his position." As this creek receives the waters of the Spring Creek on which the State fish hatchery at Caledonia is situated, it is easy to understand that there were trout here in pioneer days.

But to return to our salmon: Enos Stone, who in 1811 cleared a few acres of land on the east side of the Genesee River, just where the Erie Canal aqueduct crosses the stream, and shot a bear that was ravaging his cornfield. Enos in his reminiscences tells of an occasion

when he knew ten barrels of salmon to be caught in a weir on Irondequoit Creek. Mr. Stone was the man who one night, while searching for lost cows at the head of Irondequoit Bay, saw an unexpected camp-fire and made his way thither, to find that it had been kindled by the Indian chief Brant, who said he was on his way from the west to Canandaigua. Roswell Atchison, a pioneer of Parma, said that he one day caught three barrels of salmon in Salmon Creek, which enters Braddock's Bay.

The fountains of Irondequoit Creek and Salmon Creek still mingle with the River St. Lawrence, and the St. Lawrence with the ocean; but if any salmon from the Atlantic has of late years ventured into the bays it probably found the surroundings uncongenial and went back to the salt water to spread a report that a change for the worse had come over the old familiar haunts on the south shore of Lake Ontario. There are still some great pike and bass to be found in Irondequoit and Braddock's bays, but although I have been shooting and fishing and sailing over them for a good many years, it has never been my good fortune to hear of or see any salmon caught there. If the creeks were traced to their present sources they would probably lead to a barnyard, and salmon have not become reconciled to the conditions; 'tis true, 'tis pity.

EDMOND REDMOND.

ROCHESTER, N. Y.

A California Reminiscence.

SAN FRANCISCO, March 4.—If old wine is valued for its age, why should not an old story be, provided it is old enough to have been forgotten by present-day readers of FOREST AND STREAM? You ask me what that one was of my earlier contributions touching upon the discovery of a Delmonico cook in one of my trout-fishing experiences. I think I can remember the episode you refer to, if it is worth repeating.

In the earlier days of California there were innumerable streams that had never known the advent of such a thing as an artificial fly upon their water, or for that matter, a hook of any kind, as the early settlers were not educated in angling. In my boyhood the passion for fishing was a pursuit to which I gave more attention than to my books, and an important item of my belongings was always a trout rod and a book of flies. I had a friend who was equally fond of the pursuit; and having heard of a promising stream some twenty miles down in the country from San Francisco, with but a meager description of its locality, we chartered a horse and buggy and set out in quest of it. There were as yet no fences to prevent free going in any direction, so after a drive of twenty miles over the only road the country afforded, we struck off in the direction the creek was supposed to be. The country was flat, with no impediments except the crop of wild oats, affording splendid feed for the band of wild cattle that roamed at will. When we struck the foothills we found several cañons or gulleys that bothered us a good deal, until we came to the edge of a deeper one than any we had met with, at the bottom of which we were gladdened by the sight of what appeared to be as promising a trout stream as one would ask for; but the question was how to get down to it. The banks were too steep to permit of taking our wagon down, and we finally solved the problem by unharnessing the horse and sliding him down, and with a rope we lowered the wagon by taking a turn around a tree. The opposite bank was less difficult, and hitching up we managed to find level ground, and drove along the creek in search of a lone shanty described to us as being the abode of a Frenchman. After driving about a mile, by the greatest piece of good luck we encountered it, a mere shack, set in the costliest of spots under the shade of a grove of trees. The proprietor was swinging in a hammock, smoking a pipe, and at our hail raised his head and answered our hallo, a very much surprised man, as he afterwards told us. We were the only intruders on his solitude for three months. Having unharnessed the horse and picketed him out in the patch of wild oats, we proceeded to get our tackle in order, meantime inquiring of our landlord as to the prospects for trout. He comforted us by saying, "Plenty of fish." The creek ran within a few rods of us, and we were soon ready for the fray. At the first cast made there was a rush, and we landed doubles, and so on every cast. The trout were not large, but of fair size. Our baskets were soon filled, and we adjourned to the shack and dressed as many as we thought we could eat, and that was a goodly number, for we were hungry.

On inquiring of our landlord if he had such a thing as a frying pan, he produced one, and my friend, who prided himself on being an expert camp cook, remarked: "Of course, this tramp don't know how to cook a trout; I will just show him." The tramp looked on, smoking his pipe; but being rather the worse for our day's travel, it was suggested that before eating our supper we would have a bath; so, adjourning to the creek, we had a refreshing dip. Returning to the house, we were surprised at seeing a little rude table set out under the trees, on which were casters, china plates, a white cloth and napkins. Where they all came from was a mystery, but they were there. My friend says: "Now for the trout. I will show you how trout should be cooked." But here came our landlord with a platter piled up with nicely browned fish. How many we ate there is no record. The fish were followed with small cups of delicious black coffee. After smoking our pipes we rolled up in blankets and slept as only tired hunters and fishermen do. Our breakfast was a repetition, with hot white rolls in addition.

We lost no time in refilling our baskets with trout, and prepared to depart. Our landlord would accept no remuneration, only a few flies and a line and a pocket-knife, having lost his. Brown, thinking to compliment him, said: "My friend, there is the makings of a good cook in you. Why don't you go to San Francisco and hire out? No doubt you could get a good situation."

There was a twinkle in the Frenchman's eye as yawningly he replied: "Yes, I can cook a leetle. I was Delmonico's chef for ten years, and I get what you call tired, and come to California to get a leetle rest." Poor Benson. You should have seen his face. The idea of his proposing to show Delmonico's chef how to cook was

too much for me, and I laughed for the twenty-five miles of our drive home.

We kept the secret of our pet stream, rest assured, and made many subsequent trips that spring, until our Frenchman, having had his rest, returned to resume his labors, presumably at his old quarters. We did in one instance impart our good thing to a couple of friends, true sportsmen—Jim Riddle and Ward Eaton, whom old Californians will recollect as prominent business men. They always hunted and fished in pairs. We gave them the directions and they set out one Saturday for the location. Riddle had imported from Boston a light express wagon, with the gear painted bright red. They got along very well until, having to cross a part of the route which was a pasture for a drove of wild cattle. It is well known that such have a bitter enmity for anything red, and it was exemplified in this case.

The first intimation our friends had was the bearing down upon them of the whole herd, headed by an old bull, pawing the ground and bellowing. Jim said: "Ward, I believe that old cuss means mischief; we must run for it." Whipping up the horse they essayed to escape, but it was useless; down came the drove. The old bull, with fire in his eye, charged the wagon, capsizing it bottom up and throwing them with all their belongings to the ground. For protection they crawled under the wagon, while the bull was battering away at the red wheels. It so happened that Riddle's gun had landed within his reach, and crawling out from under the wagon he slipped in a couple of cartridges, and at the next charge of the bull it was a very much surprised animal at the reception of a couple of charges of No. 6 shot in the face. At the report of the gun the drove stampeded, followed by the bull, shaking his head, apparently with a loss of interest in the proceedings, but greatly puzzled to account for the tendency of red wagons to go off in that disagreeable way.

Once in safety, the two fishermen compared notes on damages. The horse had broken loose, but was caught. The broken harness was patched up and a broken shaft was lashed with the halter. Several battered spokes did not count, and loading their traps they started back home in disgust. Monday morning Eaton turned up at his place of business with his arm in a sling, and Riddle with a nose under the shadow of a large patch of court plaster. It was noticed that the next time the pair set out in that wagon it had lost all its pristine beauty and was painted a sober green as a concession to the prejudices of belligerent bovines. All old Californians have an affectionate remembrance of the two sportsmen, who have now gone over the great divide, presumably to happier hunting grounds, where red wagons and infuriated bulls do not exist.

FOUDERS.

Fishing Up and Down the Potomac.

Gravelly Run.

THE law establishing the territorial area of the District of Columbia, defines it as covering that part of Maryland ceded for the permanent seat of government of the United States, "including the River Potomac in its course through the District, and the islands therein."

This has always been held to include Alexander's Island at the south end of Long Bridge, but the jurisdiction has been claimed by the State of Virginia, and it leaves the disputed territory a neutral ground, that has been a great convenience for the sporting fraternity, and an eyesore to the moral element of both State and District. The settlement on the island was at one time expected to be a twin city to Washington, and was dedicated to Jackson at its christening with considerable ceremony, but the primitive bridge on one side, brick yards on the other, and too much liberty between has prevented its growth. The Railroad bridge, a long, low, antiquated wooden structure, an antebellum relic, is a monument to railroad jealousies and power. On the single track, which runs across this, a few feet above the water, run the trains of the Seaboard Air Line, the Atlantic Coast Line, the Pennsylvania Railroad, the Chesapeake & Ohio Railroad, the Southern Railway and the Washington & Mount Vernon Electric Road, and that they can run at all, without daily disaster, is a standing object lesson and advertisement for the block system.

The original bridge was built on piles, and the oldest inhabitant tells of a storm exactly like the one just past, which carried away the Chain Bridge above Georgetown, brought it down on a raging flood against the Aqueduct Bridge, which had a narrow escape, but just let it through with comparatively little damage, brought up against the low-lying Long Bridge, and only got through at the toll of a pier or two.

To strengthen the piers, rip-rap has been placed above them, until it is said the river is partially dammed, and the bridge so easily gorges with ice floods, that the structure is not only threatened, but is itself a menace to the city of Washington, and responsible for damaging floods in the past.

This danger may secure new or other bridges in time, but the present condition is little credit to the railroad and legislative situation, that makes of a single track, the only link between the North and South, across the Potomac.

Between this island and the mainland is a tide water marsh, once good reedbird and rail shooting, but too public now.

Gravelly Run, or Roach's Run, as it is sometimes called, empties out of this into a broad shallow cove, which abounds with perch, minnows, catfish, eels, carp and bass.

In pleasant weather, at almost any hour, men, women and boys, may be seen fishing from the trestles with primitive tackle; the latter sometimes wading in the pools for crayfish, or blood-an-ouns, for bait to use off the Long Bridge, where many fine bass are caught every season.

Further down, past Fort Runyon Hill, much of which has been cut away for brick materials, the wide shallow edges of the cove, bar approach, except for boats, and the ducks still find comparatively safe harbor out of gunshot from shore.

In the deeper water, and about the decaying piles of an abandoned wharf or two, when the tide is up, the perch and sunfish are plenty, and the big-mouthed bass has

planted himself in the last year or two, and promises good sport for the future.

The ring perch or yellow perch comes out of the mud, or wherever he may spend his winters, a sickly bleached color, his stripes hardly showing, and hardly life enough to run with a bait after he has swallowed it, until the middle of April, when he begins to regain both color and life.

They do not grow nearly so large in this country as on the other side. Astley H. Baldwin in 1862 in an article in *Once a Week*, p. 431, declared the perch of the Danube not only the best, but the largest, running as high as 6 or 7 lbs. But more than a score of years before, Yarrell, in his "British Fishes," told of instances of 8 and 9 lb. perch being caught in British waters; while a yellow perch here weighing a full pound is a matter of wonder.

Houghton's "Fresh-Water Fishes of Great Britain," with first-rate illustrations, gives this perch with much brighter colors than ours, the red of his fins rivaling that of the Japanese goldfish, and described as a bright vermillion.

They are voracious little fellows, and Cholmondeley-Pennell relates catching one foul in the eye, and the eye remaining on the hook. The fish being too small for the basket, was thrown over, and the eye left on the hook for bait. A moment later he landed a fish, which to his wonder was the one he had just released. Ghastly enough, but presumptive evidence that that fish did not suffer great pain, or possess very delicate nerves, but Gay thought man as stupid, when he wrote:

What gudgeons are we, men,
Every woman's easy prey;
Though we've felt the hook, again
We bite, and they betray.

Kit North, sixty-odd years ago, reviewing in *Blackwood* (Vol. 38, p. 122), Stoddart's "Art of Angling in Scotland," exhausted his wonderful powers of derision on Stoddart's account of sundry experiences, in looking with a fly, accidentally or otherwise, other objects than the fish it was intended to invite.

North said, among others things: "We suspect the art of angling, as practiced in Scotland, by Thomas Tod Stoddart and his friends, is not generally understood by our subscribers in the south. Besides snipe, bats, wild ducks, flappers, swallows, seagulls, etc., which an accomplished angler would scarcely condescend to capture if he could help it, the author of the 'lunacy' sometimes chances to hook other creatures of various sorts, and a brother of the rod, when trying for a famous salmon cast, hooked an ox."

Christopher North was funny, entertaining, and of all the old writers on the subject (while simply awful at exaggeration), was one of the few whose writings would be missed, but he was not an angler. This may sound like heresy, but in his latest confidences with his readers, he admits spending his holidays near famous waters without touching a rod. Boasting of retaining the requisite strength, he confessed the spirit had departed. He never had it. There is not on record a name among the elect ever guilty of such apostasy, and there is but one charitable construction to be placed on his denial of the faith; he deceived himself when he thought he belonged to the fraternity.

This does not affect his strictures of fly-casting for birds, but a wide acquaintance among fly-fishermen, if he enjoyed their confidence, would hardly have left him shocked or surprised to hear that the fly in its backward flight engages sometimes, strange things, besides trees and haystacks. Trout fishermen in good waters have frequently told of catching fish on the backward cast, where the fly had inadvertently struck the water behind them. A friend who was in charge of a reservoir station saw some bass feeding in the late evening, and at dark when he closed the station, he went down below the dam to try a cast. At almost the first reach behind him he heard a howl of fright and something on the dam behind him ran off with his tackle. His favorite setter had followed him, and running along the top of the bank got in the way of the fly, and it was with some difficulty he succeeded in saving both fly and dog. Another friend has at one time and another in a long experience, caught on his hook nearly everything mentioned with such surprise by North except the flapper, and he may have had one of these, but in the absence of any definite information as to the identity of the animal, this is not insisted upon.

Once this was done deliberately. Coasting along the south end of Gravelly Run cove, a wild duck flew out of the grass and lit a few rods away. It had evidently been hurt the winter before, and unable to join his comrades in their migration, but had since recovered. Here was a chance to secure an interesting pet, and the two boats started after him. By circling far out he was flanked and started toward shallow water, but as the skiffs approached, he flew out between; again he was surrounded as well as two boats could perform that operation, and as he flew past a fly was thrown at him, but he went faster than the light tackle, and was out of reach. The next time he varied the performance by diving, and the long grass in the river prevented his getting far enough below the surface to hide his wake; a sharp spurt with the paddle for a hundred yards, and as he came up the fly settled over him; a twitch of the rod and the No. 10 hook was fastened in the web of his foot. He flew up and the little rod pulled him down; he dived and the little rod pulled him up, but half-swimming, half-flying, he emptied the reel, and when the other boat approached to pick him up he circled round and round, and with the pursuing boat made a first-rate imitation of a corousel, until boat and duck were exhausted, and the latter was brought to the side of the boat and landed unhurt. It seemed impossible then, that perch tackle and a 4½ oz. rod should have held him. He was in beautiful plumage, his snowy topknot and pied body making him the prettiest of our wild ducks, save one, the wood duck.

Kit North's strictures were recalled, about self-respecting anglers, and it was decided that if he had ever had just such an experience, he would be proud of the feat. Another instance recalled is a Western lake, where fishermen set trammel nets and drive the native carp or buffalo into them. One morning on our way to the moss beds, for bass we passed over the muddy buffalo grounds, and the boatman rattled his oars in rowlocks, when the buffalo

in fright, coming to the surface, scurried in every direction away from the boat, with their shoulders out of the water. The line was cast across the course of a big fellow, and as he passed a strike fastened the bass hook into his dorsal fin. Then there was a battle royal, with the odds in favor of the fish. Of course, there was no guiding him, but the water was open, and he performed some wonderful evolutions, for they are a strong fish. He worked all the way up to the moss beds, and when finally netted, was standing on his head in the moss with 6 in. of his tail feebly waving in the air like a flag of truce. It is needless to say he was immediately released, but his memory is honored.

HENRY TALBOT.

CHICAGO AND THE WEST.

Preserving Flies.

CHICAGO, Ill., March 11.—Mr. Norman Fletcher, of this city, is good enough to send me some nicely tied specimens of the black gnat and the Ronald Stone fly. He tells me that he has been very successful sometimes with the black gnat with lead colored wings, on dry, hot summer days. Mr. Fletcher also adds to our angling lore by the following tip on keeping angling gear. He says: "I have kept my fly-books and flies in small bags made of light cotton duck for a term of years, and have never had any trouble with moths that so many complain of. When my fly-books are not in use they are always in these bags, tightly tied at the mouth with strong twine. Some years ago I soaked all of these bags in a solution made by dissolving paraffine wax in benzine. I treat all braided silk lines, that I use for minnow casting, in this same mixture. It makes bags and lines practically waterproof. I have never yet found a braided silk line that would work well all day, casting minnows without a sinker, unless treated in this way. Of course, it is easy to cast with most any line when it is soaked with water if you put on a heavy sinker."

Arkansas Vindicated.

Mr. Joseph Irwin writes me from Little Rock, Ark., to vindicate the honor of that State against my charge regarding its frogless condition. I cheerfully apologize, and am willing to admit that when it comes to general portliness and solid citizenship in frogs, Arkansas leads the world. I really never knew, however, that our speckled frog, sometimes known as the leopard frog, is a stranger to Arkansas. Mr. Irwin remarks:

"I noticed in your last issue that you misunderstood my meaning when I said we had no frogs in Arkansas. What I meant was that we did not have the little green frogs that are so well known by fishermen around the Northern lakes, and so extensively used for bass bait. Speaking of frogs, such as are used as a table delicacy, I will put Arkansas against the world, as I have seen them down here as large as it seems to me possible for them to grow in any country; but with several years' experience on the lakes and streams of this State, I have failed to find the little green frog that I have so successfully used when fishing in Wisconsin, Michigan and Minnesota, where it is only necessary to stretch a net around a little stagnant pool and make a drive, and you have bait enough to last a whole day's fishing, and sometimes enough for a week, provided your frog climbs the line, as I have often seen them do—an act caused by the swift rush of the bass through the water after he is hooked."

"Our fishing season is opening up here very nicely. While but few bass have been taken, except in the running streams, the croppy fishing has been very good the past few days in Scott's Bayou, where our new Old River Club house is located, where is to be had the finest all-round fishing in this immediate section of the country."

The Robbery of the Red Pipestone.

Everybody has seen the red stone pipes of the Indian. You have seen these pipes in all parts of the country. No doubt you have heard, through Longfellow, or otherwise, of the great Red Pipestone quarry. Perhaps you did not know that there was but one such quarry of this stone to be found in all the United States. Perhaps you thought that this main quarry was located somewhere in Dakota. Really, it is situated on the Pipestone school section, in southwestern Minnesota. This land is the property of the Yankton tribe of the Sioux Indians. It lies in the bed of the Pipestone Creek, on one side a cut bank of granite 60 ft. high. Once the soft red stone cropped out all along the lower bank of the creek, but now it has to be quarried from below the level of the creek bed.

This spot has been visited for ages by the Indian tribes of America. It is now the gentle wish of the Great Father to rob the Indians of this sacred piece of earth. Major McLaughlin has been given the delicate task of persuading the Indians that their traditions do not amount to anything, and that they really do not care for this sacred ground, which they say was "stained by the blood of their fathers."

In the old times, after the mysterious way of the wild regions, the fame of this red pipestone quarry was known among nearly all of the North American tribes. It is said that Indians have traveled from the Rocky Mountains, from southern New Mexico, and from Ohio, in order to get some of the red clay for the making of their pipes. The St. Paul Pioneer Press says that it was the custom to wrap the little slabs of the clay in wet blankets in order to keep it soft, until it could be manufactured. It is stated that a red pipe in central North Dakota is worth a pony, and that in Mexico or Arizona it is worth a wife. Certain it is that the spot is considered a sacred one by Indians of many tribes. In the Rainy Lake country there is a deposit of black pipestone, but this seems not to be prized very much. It was once proposed to open up this quarry and divide out the products among all the Indian tribes, but this proposition was vetoed.

Curious enough, this mission of Major McLaughlin's is combated not only by the Yankton Sioux, but by several other bands. In 1858 the Yanktons ceded their reservation and moved to the Missouri River, but stipulated that they should still have title in the pipestone quarry. The proposition to sell this land to the Government has been opposed by the Crow Creek Indians and by the Poncas. The Poncas have been on one reservation in

Northern Nebraska for over 100 years, according to published report. If the wishes or feelings of the Indian are entitled to any respect at all, certainly the Government has a hard task before it in asking them to alienate this unique and priceless possession, around which cling their most sacred traditions. Red with the blood of their departed forefathers, red like the skin of the Indian, when the great quarry is wiped out the red man will soon be wiped out also.

Minnesota Forestry.

There is a bill before the Minnesota Legislature providing for the taking over by the State of non-agricultural lands for forestry purposes. Gen. C. C. Andrews is giving lectures on this subject, and is doing much to extend popular education on forest reserves. I quote a few paragraphs from his remarks:

"Natural forest wealth is one of Minnesota's specialties. The white pine, the most valuable timber tree in the world, is a favorite of our climate and soil. A single acre has sometimes contained 100,000 feet of standing pine, easily worth \$300. A hundred million dollars' worth of pine has been cut in Minnesota, and the supply is nearing the end. Michigan was remarkably rich in pine, but her supply is so nearly exhausted that she now annually imports from Canada \$2,000,000 worth of logs to keep her mills running; but we are too distant to do the same.

"Our supply of standing pine may last fifteen or twenty years longer. On our school and university lands, as well as on private lands, much young pine is growing, and if protected from fire, and especially if some of the waste lands be reforested, the timber can be indefinitely continued. This means much to the general prosperity, for the logging camps and mills together employ 20,000 hands."

Gen. Andrews made a plea for the acquisition by the State of land that is too sandy, too hilly or too rocky for agricultural purposes. His suggestion was that such wastes should be permanently occupied for forests. On average soil forest growth equals interest on the capital economically expended for planting it. Much of the land on which no taxes are paid would yield a good revenue if forested.

E. HOUGH.

1200 BOYCE BUILDING, Chicago.

Opportunities for Anglers.

It is natural that at this season of the year persons who for any reason may have angling privileges or rights to dispose of should offer them to the public. Our advertising columns this week contain several such offers, which cover trout and salmon fishing and angling combined with shooting. Such opportunities appeal to numbers of our readers.

TRIMIENSIS VINUS.

Upper figure in adolescent stage. Lower figure as captured, identified and sketched by H. C. McDougall. Now biting sharply in New Jersey.

Fresh-Water Turtles.

Editor Forest and Stream:

Since queries of all sorts seem to be most productive of answers when published in your columns, I would like to propound a few concerning fresh-water turtles. I would like to know what varieties of turtles are edible, and how they should be dressed and cooked when intended to be eaten. Any general information concerning turtles will be exceedingly acceptable. The best ways to capture them have always seemed to me to be a set-line or a small-bore rifle, but there may be far superior methods, and of these also I hope to learn. For answers to my queries I appeal in particular to Fred Mather and Kingfisher, the former because he seems omniscient, the latter because he mentioned eating turtles of the pond and river variety. My experiences with turtles have been varied and interesting, but they have never had to do with the culinary department. I have often had my bait, and often even my strings of fish, eaten by these iron-clad pirates, and have taken ample revenge with a .22cal. The most savage fight I ever saw was between two big snapping turtles. Inspired, no doubt, by some fair female of their species, they fought with the utmost ferocity, totally oblivious of everything except each other. I also once saw two small turtles, one of which had the other by the throat, and like a well-bred bulldog, he suffered himself to be lifted into the boat rather than lose his grip. The greatest instance of rustic stupidity I ever encountered was a farmer who had a fine trout pond, which had gradually become the home of turtles till it was almost depopulated of trout. As for the turtles, they were inconceivably numerous and insolent. I succeeded in killing about twenty with stones, but this did not affect the population. The owner of the pond had noticed the decrease of trout, but he treated my suggestion that it might be caused by the turtles with scorn, which can only be engendered by colossal ignorance.

One more question: Has the fresh-water turtle any enemies, the human race excepted? It has always been my impression that if a turtle once got out of the egg he was pretty sure to live to a green old age. To be sure, I once found a small turtle in a black bass, and another in a big frog, but I should imagine turtle, shell and all, as rather too heavy for ordinary diet. RUSSELL MOTT.

The Kennel.

Fixtures.

BENCH SHOWS.

March 14-17.—St. Louis, Mo.—St. Louis Kennel Club's show.
March 21-24.—Chicago.—Mascoutah Kennel Club's show.
April 4-7.—Boston, Mass.—New England Kennel Club's bench show. James Mortimer, Manager.
Nov. 22-24.—New York.—American Pet Dog Club's show. S. C. Hodge, Supt.

Mascoutah K. C. Ninth Annual.

CHICAGO, Ill., March 11.—The ninth annual show of the Mascoutah Kennel Club scored a fair success in the First Regiment Armory, Sixteenth street and Michigan avenue, this week. As a society function the dog show is a fixture, of course, and the attendance was never of higher class. The canine portion of the show also scored at least a success of estimation. There were over 1,000 entries and 575 dogs were actually benched. The conduct of the show was smooth and good. The judging was no doubt as popular as it ever is at a dog show, the work being apportioned as below among the different judges.

Bloodhounds, St. Bernards, great Danes, Newfoundlanders, Russian wolfhounds, deerhounds, greyhounds, Dalmatians, poodles, black and tan terriers, dachshunde, skye terriers, Bedlington and Dandie Dinmont terriers, Pomeranians, Yorkshire and toy terriers, King Charles, Blenheim, ruby, Prince Charles and Japanese spaniels, Italian greyhounds and miscellaneous, H. W. Lacy, Boston, Mass.

Mastiffs, bulldogs, bull terriers, Boston terriers, French bulldogs, fox terriers, Airedale terriers, Irish terriers, Scottish terriers and Welsh terriers. J. J. Lynn, Port Huron, Mich.

Foxhounds, Chesapeake Bay dogs, pointers, English, Irish and Gordon setters, and beagles, Major J. M. Taylor, New York.

Pugs, Arthur Froembling, Chicago.

Spaniels, collies and old English sheep dogs, Henry Jarrett, Philadelphia, Pa.

English Setters.

The class of English setters was not overwhelmingly large, but ran a very good average. One might pick a very fair hunting dog on almost any bench in the setter row. Mr. W. B. Wells, of Chatham, Ont., carried off the principal honors with his string. With Selkirk Dan he took first in the open, first in the limit, first in the winners' and also won the Great Northern Cup for best English setter exhibited, this being the second time he has carried off this trophy. Selkirk Dan was shown in good fettle. He is a fine, upstanding dog with grand body, and running gear all that one could ask. His head is a trifle peaked and bitchy, but not sufficiently to obscure his merit as a good type. He is a strong, useful-looking setter, above the medium size of to-day, with beautiful markings and a fine coat. Benched near to Dan in the setters was Gilhooley, second, a fine big fellow of the Laverack type, with splendid bone and a lot of feather, altogether a likely looking one, barring an unpleasant lightish coloring, his coat effect being that of a dingy gray, with pale liver ticking. Gilhooley shows a head hardly of the pure setter model, but one could hardly help admiring his appearance of power and activity.

In the open, bitches, Mr. Wells again took first with Luna, a good-sized, useful bitch, which carried a beautiful head, and seemed to have stamina, strength and constitution, with a sensible and level-headed look. This bitch was shown in good condition, and looked a winner. Second in this class, Frederica Mathews, is lighter in body than the above. Iris, third, another of Mr. Wells', is well fitted with head, and indeed appeared throughout the hunting dog. Lun won first in the winners' class of bitches.

In the limit class Selkirk Dan and Gilhooley were first and second, third falling to Tony's Hope, which was shown rather light of flesh. Tony might be better in apparent strength of back. In the novice class, bitches, Mr. Wells took first with Selkirk Freda, and second with Selkirk Bretta, another of his vest-pocket ones. Mr. Wells has clung to this small type pluckily and does not give in when cited to his winnings in the open classes with good big ones, such as Selkirk Dan and Lune. In the limit class, bitches, first was Miss Mischief, of Dash Antonio get, a stocky and strong bitch, not large, but of very serviceable look. Mr. Wells came second in this class with Selkirk Freda. Out of all the setters I think one would have most reason to select Selkirk Dan, Gilhooley, and Mr. Wells' two larger bitches for dogs of a practical and workmanlike type. All the Canadian dogs were shown in very workmanlike condition, and made a good string. Mr. Wells also won the setter team prize, and indeed he should feel satisfied, for he is taking back nearly everything but the Armory.

Pointers.

Pointers turned out a good full class, with some good ones, but with an average not up to that of the setters, there being a full showing of weeds. First in the heavy-weight open was Sir Walter, also first in the winners', also special for best dog or bitch exhibited. Sir Walter was shown in flesh fit for a Japanese wrestler, and apparently took naturally to the show business, for he fell into attitudes with the utmost gravity and aplomb. A bit light in color, with pale lemon tickings, this dog is none the less a hard one to get away from, being in every way a model of force and strength, yet naturally, perhaps, not too heavy for requisite activity. He is a big dog, and as he was furnished up to a house-dog standard, he seemed to lack a certain look of activity which one does not dislike in a field dog, yet as to mere faultlessness on the floor he left a very good impression. Sir Walter would have probably weighed very near to 60lbs., as he showed, and reduced to under 55lbs. he would have left fully as good an impression, I should say. Thus Prince's Roy, third in the same class, a slightly lighter dog, of good symmetry, nice head and fine body, seemed so much brighter, quicker and snappier in his carriage as to make one very willing to leave Sir Walter to have a look

at him. Meteor's Dot II., second, is another big one, and no doubt placed rightly.

In pointers under 55lbs., the St. Louis dog, Hempstead Jim, was first, first also in the open, and reserve in the winners' stake. I fancied this dog very much. He is compact and muscular, quick as a cat, yet not nervous, and showing apparently a normal constitution. He is a pointer one might well take home with him. Devonshire Jennie, first in the open, bitches, over 50lbs., seemed a long-coupled and rather coarse-headed bitch.

In bitches under 50lbs., first went properly to Westlake's Startle. Mr. William Werner, of Chicago, secured second with La Luca, the latter of very nice type, but shown rather light in flesh, almost down to field form. In the novice class, dogs, Mr. Werner got H. C. with Sir Buttons. This dog carries a head a bit faulty in stop, and too cheeky. His chest seems too contracted for good heart and lung action. I did not get to see Spot, in the novice class, but Ripstone, first, was my pick of what I saw in this lot. Ripstone belongs, to Mr. Bisbee, of Fargo, N. D., and I should not dislike to own him as a speculation for a field dog. He has good frame and legs, and a head at least plenty coarse enough. He comes from a country where they know what a hunting dog should be. Out of all the pointers I saw I liked Prince's Roy, Hempstead Jim and Sir Walter. The latter achieved first honors, but I cannot avoid disassociating his logy look with the snap and go with one or two of the others. Of course, this is not fair to Sir Walter, for he was heavy in flesh and dull with the circuit. Brighton Joe is another pointer which should not be left out of the mention, placed second in the light-weights, open and limit.

Deerhounds.

It was easy in the deerhounds, Mr. Norvin T. Harris' good young one, Hurstbourne The Sirdar, being the only entry. I mention this dog because he is, or rather will be, a grand one of his sort. He is a bit soft and puppyish yet, but is a splendid animal, of great stature, and that dignity of carriage which gives this breed so great a presence.

In this class there was next to nothing, and it is a bit surprising that out of all this Western country, where we have more than a theoretical idea of what a greyhound should be, there should be no one to send a few representatives. The breed seems losing interest in the West. Mr. Roger Williams' old bitch, Maid Marian, upheld the honor of her kind very nicely. This bitch must be about nine years of age, but looked hardy and fit. She is a handsome tiger brindle, and a very useful looking creature still.

Foxhounds.

Another very light class. Mr. Norvin T. Harris showed Carmen in the open, bitch, class, American hounds. This bitch has a good record East, and seemed a very good specimen of this ironside breed.

Chesapeakes.

Two entries; Chester first, Don Pedro second.

Irish Setters.

There was but limited showing of these beautiful dogs. In the limit, bitches, Biddy Finglas was first, a beautiful creature of fine frame and good underpinning. Biddy's head is good, except that the lips are a bit cut back. In the open class, dogs, Lord Lismore was placed first. This one has a head very hard to get away from, but he was shown poor in coat and flesh. Fred Elcho, second, is a good one and was shown fit as a fiddle. In the open, bitches, Queen Vick was first, a very lovable specimen, which also won the Torrence cup for best Irish setter. This breed is always sure to turn out some handsome animals, and the above mentioned are surely to be so classified.

Gordon Setters.

Only eleven dogs were shown. In the open class, dogs, Heather Lad was first, a handsome animal, and looking a winner all over. There is a look of power and endurance to this breed which gives them many devoted admirers, and Lad very well upholds the credit of his kind. Dwight Grouse, second, is another good Gordon, very high-headed and upstanding, a fine and showy creature. In the open, bitches, Lady Gordon took first by right, a grand bitch, and shown in good shape. Highland Beulah, second, was light in flesh, which detracted from her appearance, and of Dwight Pleasure I could not think much.

Other Classes.

In spaniels, one got a good run for his money. Collies showed fairly full. The Russian wolfhounds had grand specimens, and the St. Bernards offered some of the best ones to be found on the circuit. Besides these, there were dogs and dogs, as one sees at all dog shows, each with its admirers, though none of these breeds, I imagine, would appeal to the sportsman sufficiently to warrant extended comment.

Irish Setter Club's Field Trial Prizes.

THE Irish Setter Club of America, having offered \$10 for each Irish setter running in any public field trial, beginning with the Iowa field trials, Aug. 31, 1898, and ending with the Alabama field trials of February, 1899, desires those entitled to the same to forward their names, address, name of dog and date and place of running to the secretary, George H. Thomson, room 278, City Hall, Philadelphia, before April 1, 1899.

Death of Toledo Queen.

DETROIT, Mich., Feb. 11.—I am sorry to say that Toledo Queen died to-day. While only eight years old this month, she has won many prizes on the bench and in the field trials since your publication of the cut of her by Mr. Edmund H. Osthaus, she being the best all-round dog I have ever raised or owned, and was well known to the fraternity of setter dog fanciers.

CHARLES A. RATHBONE.

Points and Flushes.

The readers of FOREST AND STREAM and his friends generally, will be gratified to hear that John Davidson, of Monroe, Mich., is recovering from the effects of a badly frozen nose. During the severe weather, which pinched everybody more or less in the latter part of February, John had a good solid dose of it one day walking from his home near Monroe to the city. Notwithstanding this, he started to fill his engagement as judge of the bench show, held annually by the Butterflies of Grand Rapids, but the frosted nasal organ aforesaid put in a counter claim that could not be ignored, and John capitulated and went into hospital. He will be all right again in a fortnight.

The premium list of the Duquesne Kennel Club of Western Pennsylvania's first annual dog show, to be held in Old City Hall, Pittsburg, Pa., April 11-14, can be obtained of the secretary, Mr. F. S. Stedman, 215 Lewis Bldg., Pittsburg. Entries close April 1.

We have inquiries for breeders of whippets and great Danes. We lack information of this kind to furnish inquirers, so long as we do not find it in our advertising columns.

Rifle Range and Gallery.

At the Sportsmen's Show.

Revolver and Pistol Contests.

THE revolver and pistol competition, in the different events at Madison Square Garden, had a list of competitors who, at the close of the competition on Monday night, March 13, were among the possible and probable winners:

Match A—Any revolver championship, possible 300:					
Dr A A Webber.....	60	58	58	58	57—291
Dr R H Sayre.....	60	57	57	57	57—288
J A Dietz.....	56	56	56	57	55—278
C Smith.....	57	56	55	55	55—278
E L Salladin.....	56	55	55	55	54—274
A Stein.....	56	55	55	54	54—274
Match B—Military revolver championship:					
Dr A A Webber.....	55	55	55	54	55—274
Dr Sayre.....	54	52	52	51	50—259
C Smith.....	53	54	54	53	53—272
C Meyer.....	49	49	48	48	48—242
H M Olney.....	49	49	48	48	48—242
Match C—Pistol championship:					
Dr A A Webber.....	58	57	57	56	56—284
Z C Talbott.....	56	55	54	53	56—274
J B Crabtree.....	53	54	52	51	50—260
Match D—Police revolver championship:					
Dr A A Webber.....	57	57	56	54	53—277
E Wilson.....	53	52	52	51	50—258
H M Olney.....	52	52	50	50	49—253
E F M Wendstedt.....	52	51	49	49	49—250
H S Seeley.....	51	48	46	45	45—235

Rifle Contests.

At the close of the rifle contest on Monday night, March 13, the contestants and their scores, so far as they were possible winners, are as follows:

Individual championship: F. C. Ross 2425, L. P. Ittel 2419, L. Buss 2412, L. Flach 2409, Geo. Dorr 2403, R. J. Young 2391, W. A. Tawes 2390, Dr. W. G. Hudson 2389, G. Schlicht 2386, Dr. A. A. Stillman 2382, L. P. Hansen 2380, Nemo 2380, P. J. O'Hare 2368.					
Continuous match, 25-ring target, 3 shots, possible 75:					
L Buss.....	74	75	L Flach.....	70	71
E S Pillard.....	74	75	H P Flagg.....	69	71
Gus Zimmermann.....	74	74	Geo Worn.....	69	70
H M Pope.....	73	74	H D Miller.....	68	70
M Dorrier.....	73	73	Dr W G Hudson.....	68	70
F C Ross.....	72	73	Theo R Geisel.....	67	69
L P Ittel.....	72	73	C Meyer.....	66	70
G Schlicht.....	72	72	S W Burton.....	68	72
L P Hansen.....	72	71	J Facklain.....	67	68
S J Lyon.....	72	72	J W Christiansen.....	64	68
Nemo.....	70	72	W A Hicks.....	62	65

Bullseye target, best center shot, by measurement, to count:					
Gus Zimmermann.....	16	G Schlicht.....	22		
F C Ross.....	16	C Meyer.....	22		
Dr A A Stillman.....	16½	E S Pillard.....	23		
J W Christianson.....	18	W A Lempeke.....	25		
P Trainor.....	19	A Stein.....	27½		
L Flach.....	19½	G E Jantzer.....	28		
S W Burton.....	20	Theo R Geisel.....	28		
H D Miller.....	21	S Buzzini.....	29		
J Facklain.....	21	Ignatz Martin.....	31½		
M Dorrier.....	21½	G Worn.....	34		
Premiums for best five tickets on continuous match, five best to count:					
Gus Zimmermann.....	72	72	72	74	74—364
L Buss.....	71	72	72	74	75—364
E S Pillard.....	71	71	71	74	75—362

Trophies.

Trophy winners of Daily trophies: N. Spering, F. Girard, J. Facklain, G. Dorr, S. W. Burton, F. N. Obest, C. T. Schukraft, L. P. Hansen, T. H. Keller, Jr., G. E. Jahnsen, F. W. Green, H. P. Flagg, T. H. Keller, Sr., G. Worn, E. D. Lentilhon, P. J. O'Hare, Gus Zimmermann, J. Bodenstab, E. D. Miller, R. J. Young, J. W. Christiansen, A. W. Tewess, G. Schlicht, S. J. Lyong, L. Flach, C. H. Phelps, P. Stuber, H. Holges, F. C. Bissett, G. Berneus, E. D. Schorninghouse, W. P. Uhler, C. Beyer, O. C. Connolly, W. Fussell, G. Lenzinger, L. Keller, C. W. Horney, S. M. Van Allen, J. W. Johnson, Geo. Zimmermann, R. Goldthwaite, S. Buzzini, W. F. Dilger, W. A. Lempeke, G. Homrighausen, L. Buss, H. Kraus, Dr. W. G. Hudson, T. H. Geisel, H. H. Bahn, H. Von Hagen, P. Trainer, F. C. Ross, W. A. Hicks, A. Ballard, P. D. Fraser, J. Martin, C. Meyer, C. Rein, Dr. A. A. Stillman.

Trap-Shooting.

If you want your shoot to be announced here send in notice like the following:

Fixtures.

March 17.—Hoboken, N. J.—Hackensack River Gun Club's handicap shoot at live birds, at Heflich's Hotel. Open to all. Main event, 10 live birds, \$5 entrance. John Chartrand, Sec'y.

March 23.—Brooklyn, L. I.—Live-bird handicap of the Brooklyn Gun Club, at Lyndhurst, N. J. John Wright, Manager.

March 23.—Newark, N. J.—Regular club shoot of the East Side Gun Club. L. H. Schortemeier, Captain.

March 25.—Pawling, N. Y.—Postponed shoot of the Pawling Rod and Gun Club. Geo. S. Williams, Sec'y.

March 25.—Newark, N. J.—Monte Carlo shoot of the East Side Gun Club; main event 12 birds; 6 at 29, 6 at 31yds.

April 6.—Richmond, Va.—Tournament under management of W. C. Lynham. Targets and live birds.

April 4.—Chambersburg, Pa.—Chambersburg Gun Club's spring live-bird and target tournament; open to all. J. M. Runk, Captain.

April 11.—Elkwood Park, Long Branch, N. J.—The Interstate Association's seventh annual Grand American Handicap tournament. Entries close April 4. Edward Banks, Sec'y, 318 Broadway.

April 18-20.—Lincoln, Neb.—The Lincoln Gun Club's second annual interstate tournament; targets and live birds; \$500 added. Geo. L. Carter, Sec'y.

April 18-21.—Baltimore, Md.—Prospect Park Shooting Association's tournament; \$500 added. Stanley Baker, Sec'y.

Sportsmen's Association's Tournament.

THERE was much to do in all parts of the Garden on the opening day of the Sportsmen's Exposition, so much so that it was impossible to get the magatrap and motor in place in time to begin before near the middle of the afternoon. Mr. Elmer E. Shaner, the manager, was a very busy man, and but for his energy there would have been no shooting on the opening day. The Garden carpenters were in demand everywhere, and it required close attention and assertiveness to keep them at work on the roof. The weather was too bad. A high wind, catching the targets at the highest altitude of their flight, made them erratic, and the scores suffered in consequence.

The targets had a flight of 40yds. to the foot of the high board fence straightaway, and all the flights were little less than a field of 90 degrees of a circle. The shooters stood on a raised platform, 16yds. from the traps, and behind them was a space which was occupied by spectators and crowded most of the time. The tournament so far has been one of the most sought attractions of the Exposition.

The tournament was held on the west end of the Garden, high above the street, yet far up high was the airy figure of Diana, nearer a goddess in fact than she had ever been since she took up her lofty perch on the Garden tower. A high board fence surrounded all open parts where shot could fly out into space. A broad belt on the fence gradually growing darker as the days passed, indicated where thousands of loads of shot struck.

There was no more popular section of the Exposition than that devoted to the tournament. The space allotted to spectators was crowded continuously with gentlemen and ladies, who watched the competition with the keenest interest. The competition never lagged for a moment. On several days the entries of shooters were necessarily refused by Mr. Shaner, and re-entries also were refused. On reference to the scores the reader will note that this tournament engaged the interest of many of America's most famous shooters, professional and amateur, and the scores made are of a high order.

The targets were not so easily smashed as the flights would seem to indicate. When there was a wind, it caught them at their highest flights, and as there were many swirls and eddies of wind about the nooks and corners, the flights were consequently at such times very erratic.

On Wednesdays and Fridays the shooting was ended at 2 o'clock, to avoid any annoyance to the matinee people who congregated in the theater underneath. An air shaft from the roof made the reports quite distinctly heard in the parts of the Garden below where the shooting took place.

Mr. Shaner was busier than he ever was at a tournament, for the keeping of the records of a continuous match, with their re-entries, constant dropping out of shooters on misses, etc., made an infinity of detail to keep a record of, and it would be an easy matter to "ball up" the whole shoot if a serious error were made. Mr. J. K. Starr, of Philadelphia, was scorer. Mr. Bill McCrickart, of Pittsburg, was referee. Mr. J. Regan was cashier. The continuous match was a miss-and-out, re-entries unlimited.

Thursday, March 2, First Day.

As beforementioned, the shooting began so late that Sportsmen's Association championship was the only event shot. The scores follow: O. Hesse 57, W. W. Linthecum 81, O. R. Dickey 92, J. R. Hull 67, J. Tallman 89, Capt. Money 89, Harold Money 88, Dr. Knowlton 84, Le Roy 81, R. G. Clark 77, J. J. Hallowell 93, Wanda 52w.

Friday, March 3, Second Day.

The weather conditions were unfavorable for good scores. The light was good, and there was no wind, though there was a raw coldness to the atmosphere quite enough to make one feel uncomfortable. In the Continuous match, Mr. R. O. Heikes was high for the day with a run of 85.

Continuous match:					
R O Heikes.....	85	27	26	49	7
B Le Roy.....	33	16			
J J Hallowell.....	25	22	2		
E Banks.....	19	11	9	6	1 1
H Money.....	7	4	4	3	
O R Dickey.....	24	13	8	6	2
Dr J G Knowlton.....	4	3			
J R Hull.....	11	10	4	3	1 1
Phair.....	4	4	3	2	2 1 1 0 0 0
I Tallman.....	19	6	3	2	0
Clark.....	5	3	2	1	1 0
Capt A W Money.....	31	14	12	3	2 1
L B Fleming.....	14	9	7	2	
B Waters.....	4	4			
J S S Remsen.....	3	0			

This match begins at 11 A. M. and continues to 1 P. M. each day. The re-entries are unlimited. There are four prizes, which go to the four men making the four longest runs. There are additional prizes to the man making the longest run each day.

Association championship: J. A. R. Elliott 98, Fleming 92, Miss Kay 79, H. Money 86, Dr. Knowlton 90, Du Pont 70, Swivel 52, withdrew, J. von Lengerke 91, B. Waters 66, U. M. C. 60, Tallman 82, Dr. O'Connell 89, Henderson 85, Fairmont 83, R. O. Heikes 89, Banks, re-entry, 20, withdrew, Weightman 5, withdrew, Gadin 73, Capt. A. W. Money 90, I. Tallman 89, J. S. S. Remsen 71, Appar, withdrew at 64th, 64; Park 81; Heikes, re-entry, withdrew at 58th, 44; Hallowell, withdrew, 63; Le Roy 93; Dickey 91; Banks, withdrew, 44; Remsen, withdrew, 56; Capt. Money, re-entry, 95; Hull 82; Phair 58; Von Der Bosch 76, re-entry 83; Fairmount, re-entry, 88; Moffett 57.

Saturday, March 4, Third Day.

A matinee performance, held in the Garden Theater in the afternoon, caused the management to end the shooting at 1:30, and only the Association championship was contested. The weather was rainy and uncomfortable. A stiff wind made the shooting difficult. The scores follow:

Association Championship: W. W. Linthecum 86; R. O. Heikes 96; O. R. Dickey 90, re-entry, 44, w.; Harry Welles 82; Crosby 84; J. R. Hull 37 w.; Phair 79; Le Roy 95, re-entry 45, w.; Van Allen 93; Robinson 65; T. F. Allen 72; B. H. Norton 44; F. F. Wood 60; C. C. Brinton 80; I. Tallman 96; J. A. R. Elliott 92; J. J. Hallowell 86; Capt. Money 88; Miss Kay 39, w.; Wanda 13, w.

Monday, March 6, Fourth Day.

The weather was really good, and favorable for high scores. The high runs were: Heikes 79, Elliott 51.

Tuesday, March 7, Fifth Day.

There was a big snowstorm and a strong wind, which made

the most difficult kind of shooting. Shooting began at 1:30, and only one event was shot.

Championship match: Chas. Phair 55, re-entry, 68; R. O. Heikes 88; B. Le Roy 81; G. E. Avery 68, re-entry 67; Ph. Daly, Jr., 68, re-entry, 69; McDuff 72; Capt. Money 87, re-entry, 76; Ed Banks 60, withdrew; Dr. Weller 35, withdrew; Geo. Patterson 63; Wray 24, withdrew; H. Colt 35, withdrew; W. H. Sanders 48, withdrew; A. Schnebel 63; F. E. Fredericks 73; W. M. Smith 74; J. Dawson 48; E. D. Lentilhon 74; B. H. Norton 71; E. D. Fulford 85; C. Evans 70.

Wednesday, March 8, Sixth Day.

This was matinee day, and only one event was shot. There were signs of rain and the light was dark.

Association championship: B. H. Norton 76, re-entry 82; H. P. Collins 50, re-entry 53; C. Mager withdrew, re-entry, withdrew; R. Swiveller 54 out of 75, withdrew; S. M. Van Allen withdrew, re-entry, 90; H. Colt, withdrew; B. Le Roy 90; J. S. S. Remsen 82; J. R. Hull 74; Chas. Phair withdrew, re-entry 78; R. E. Wigham 55; O. R. Dickey withdrew; J. P. Howe withdrew; Gus Greiff 76; Ed Banks withdrew, re-entry, 93; G. W. Beadel 80; E. D. Fulford 85, re-entry, 90; J. A. R. Elliott 92, re-entry, 89; R. O. Heikes 93; J. J. Hallowell 85; H. Martin 61; L. B. Fleming 89; O. Hesse withdrew; Capt. Money 87.

Thursday, March 9, Seventh Day.

The weather was dark and raw. There were so many shooters, however, that Mr. Shaner refused many entries, as it was impossible to finish more, than he had in hand, and he also refused re-entries.

Association championship: O. Hesse 91, A. Betti 68, Colin R. Wise 86, J. R. Hegeman 78, J. R. Hull 90, E. B. Coe 75, D. J. Peters 79, Capt. Money 88, H. P. Collins 68, E. du Pont 74, J. S. S. Daly, Jr., 82, W. M. Smith 72, J. H. Cummings 57, J. Williams 74, W. H. Sanders withdrew, Heikes 89, Banks 80, Hallowell 84, Le Roy 91, Swiveller 71, F. Wood 37, R. L. Packard withdrew, E. D. Lentilhon 76, E. O. Weiss 46, B. F. Amend 90, C. D. Sutton 57

ON LONG ISLAND.

Brooklyn Gun Club.

Brooklyn, March 11.—The regular club shoot of the Brooklyn Gun Club brought out quite a nice attendance, considering that the Garden tournament was in progress and was a star attraction to the shooters. The main event was for the Marshall trophy. Dr. Douglas and Waters tied for it, the former winning easily in the shoot-off. The conditions in this event were 25 targets and a handicap. The scores and handicaps were: Dr. Douglas 15, with 6 handicap, 23; Waters, 18, with 5 handicap, 23; G. S. Wood 15, and 6, 21; Dr. Kemble 12, and 6, 18; Dr. Creamer, 13, and 8, 21; Dr. Stillman 15, and 6, 21; Lane 15, and 7, 22; W. Hopkins 19, and 3, 22; J. B. Hopkins 16 and 4, 20. In the shoot-off, Dr. Douglas scored 16; Waters 11.

The light was dull and the shooting difficult. Dr. Douglas has now two wins out of three for this trophy, Dr. Kemble being the other winner. The contest is now narrowed down to these two gentlemen. If any one else wins it in the next contest, it belongs to Dr. Douglas, as he then will have won a majority of the contests. If Dr. Kemble wins in the contest of this week, Saturday, then these two gentlemen will shoot off a tie.

GEORGE B. PATTERSON, Sec'y.

New Utrecht Gun Club.

Woodlawn, L. I., March 11.—The live-bird shoot of the New Utrecht Gun Club, held here to-day, was well attended. The birds were a good lot, and some good scores were made. Dr. Wynn carried off the honors, missing only one bird all day. Event No. 1 was the club shoot; No. 2, New Utrecht handicap; No. 3, quarterly shoot; No. 4, monthly merchandise shoot, two shoots to qualify on point system; No. 5, sweep. Next Saturday the return match between the Crescent A. C. and the New Utrecht G. C. will be shot on these grounds. The teams will be made up of twelve men each, and each man will shoot at 25 targets. Following the team shoot live-bird sweeps will be shot. Scores:

IN NEW JERSEY.

Oceanics—Hudsons.

Jersey City, N. J., March 13.—The second of the series of matches between the Oceanic Gun Club, of Rockaway Park, L. I., and the Hudson Gun Club, of Jersey City, took place on the grounds of the latter, and resulted in a tie, the match being closely contested from start to finish. Woods was the star performer, scoring 24. The conditions were unfavorable for good scores, the wind, stiff and steady, blowing from left to right across the traps. No. 5 threw a target which dropped quickly, while No. 1 threw a target which rose high against the wind. The light during this contest was dull and bad. The return match is fixed for April 3. The greatest good fellowship prevailed. At the first count, the victory was conceded to the Oceanics, and the Hudsons heartily cheered them. On a recount, it was discovered that the race was a tie, and the Oceanics heartily cheered the Hudsons. The men were sandwiched in, a member of each club alternately. After the first two squads had shot, the Hudsons were but one ahead, 97 to 96. The two next squads tied on 81, so that when the last squad went up, there was but one target difference in the score. The squad of the Oceanics came out one ahead, which just made the tie. It was a contest of extraordinary closeness throughout.

A. SEAGRAVE, Sec'y.

Trap around Reading.

READING, Pa., March 10.—In a team shoot to-day at the Spring Valley grounds Kerr and John Dando defeated Shaaber and Harrison by the score of 82 to 80. The match called for each shooter to shoot at 50 live birds, 28yds. rise, Hurlingham rules to govern. The score: Shaaber 42, Harrison 38; total 80. Kerr 42, J. Dando 40; total 82.

March 7.—In a live-pigeon match at W. D. Gross' Three-Mile Shooting Park to-day, Harry Coldren and John Dando, both of this city, met in a 100 live-bird match, loser to pay for the birds. Quite a large crowd was present to witness the match, which resulted in a victory for Dando by the score of 90 to 88.

Immediately after the completion of the match John Shaaber challenged Coldren to shoot a 15-bird race, for \$5 a side, and loser to pay for the birds. Coldren accepted, and the match resulted in a tie, each killing 11.

DUSTER.

Palm Beach Gun Club.

PALM BEACH, Fla., March 4.—The scores in a handicap at 10 live birds, under the auspices of the Palm Beach Gun Club, at Palm Beach, Fla., resulted in Felton winning first prize, a handsome bowl; Jones, second prize, a handsome cup, and Kaisner, third, also a cup. Mr. Parker was referee. Mr. Dandus, scorer; Mr. Dietsch, puller. Three sweeps, amounting to \$50 each, were divided between Messrs. Kaisner and Wheeler, with 7 kills straight:

Jones111111111	Disston00
Kaisner011111111	Carley103
Cook101110	Hall00
Dolan00	Reynald11111010
Bernett101110	Wheeler00
Felton111111111	Brokaw00
Toland111110	Conaway1010

Shoot-off:	
Jones11101
Felton11111

Mr. F. C. Ross, of Brooklyn, was shooting in great form in the rifle contests at Madison Square Garden. He broke previous records, and was a most promising candidate for leading winner.

Yachting.

As the yachting journal of America, the FOREST AND STREAM is the recognized medium of communication between the maker of yachtsmen's supplies and the yachting public. Its value for advertising has been demonstrated by patrons who have employed its columns continuously for years.

A Modern Centerboard Boat.

THE Cape Cod catboat as she existed a few years ago was one of the most useful but at the same time the most crude and inconsistent of small yacht types. The numerous good qualities of the type among all others of similar light draft, and safety from capsizing, the accommodation, power to carry sail and ability for rough water work, have been demonstrated time and again; and yet when the boat is carefully studied, she presents but a collection of bad features. The proportion of beam to waterline was excessive, the forward waterlines were very fine and the after ones disproportionately full, the plump stem and the mere suggestion of an after overhang cramped the buttocks and diagonals badly, and the sail plan was about as bad as it could be, with one big mainsail, a heavy mast stepped to the fore end of the fine waterline, and a boom extending far abaft the counter. The very name of catboat was a contradiction, as many of the type carried jibs either from choice or necessity, though they could be used in a way without them. The good points of the type as demonstrated in actual use and the bad points which disclosed themselves in any analysis of the design indicated great possibilities for improvement, through the use of various modern features, but the first steps in this direction, as illustrated at times in the FOREST AND STREAM, were crude and unsuccessful.

Within the past year or two, however, a great deal has been accomplished in the improvement and development of the light draft centerboard type. The design here shown, the work of Mr. W. H. Hand, Jr., of the Buzzard's Bay Yacht Agency, New Bedford, Mass., is in modern parlance a "knockabout," and far removed from the old Cape cat, both in appearance and performance; but at the same time it represents really the development of

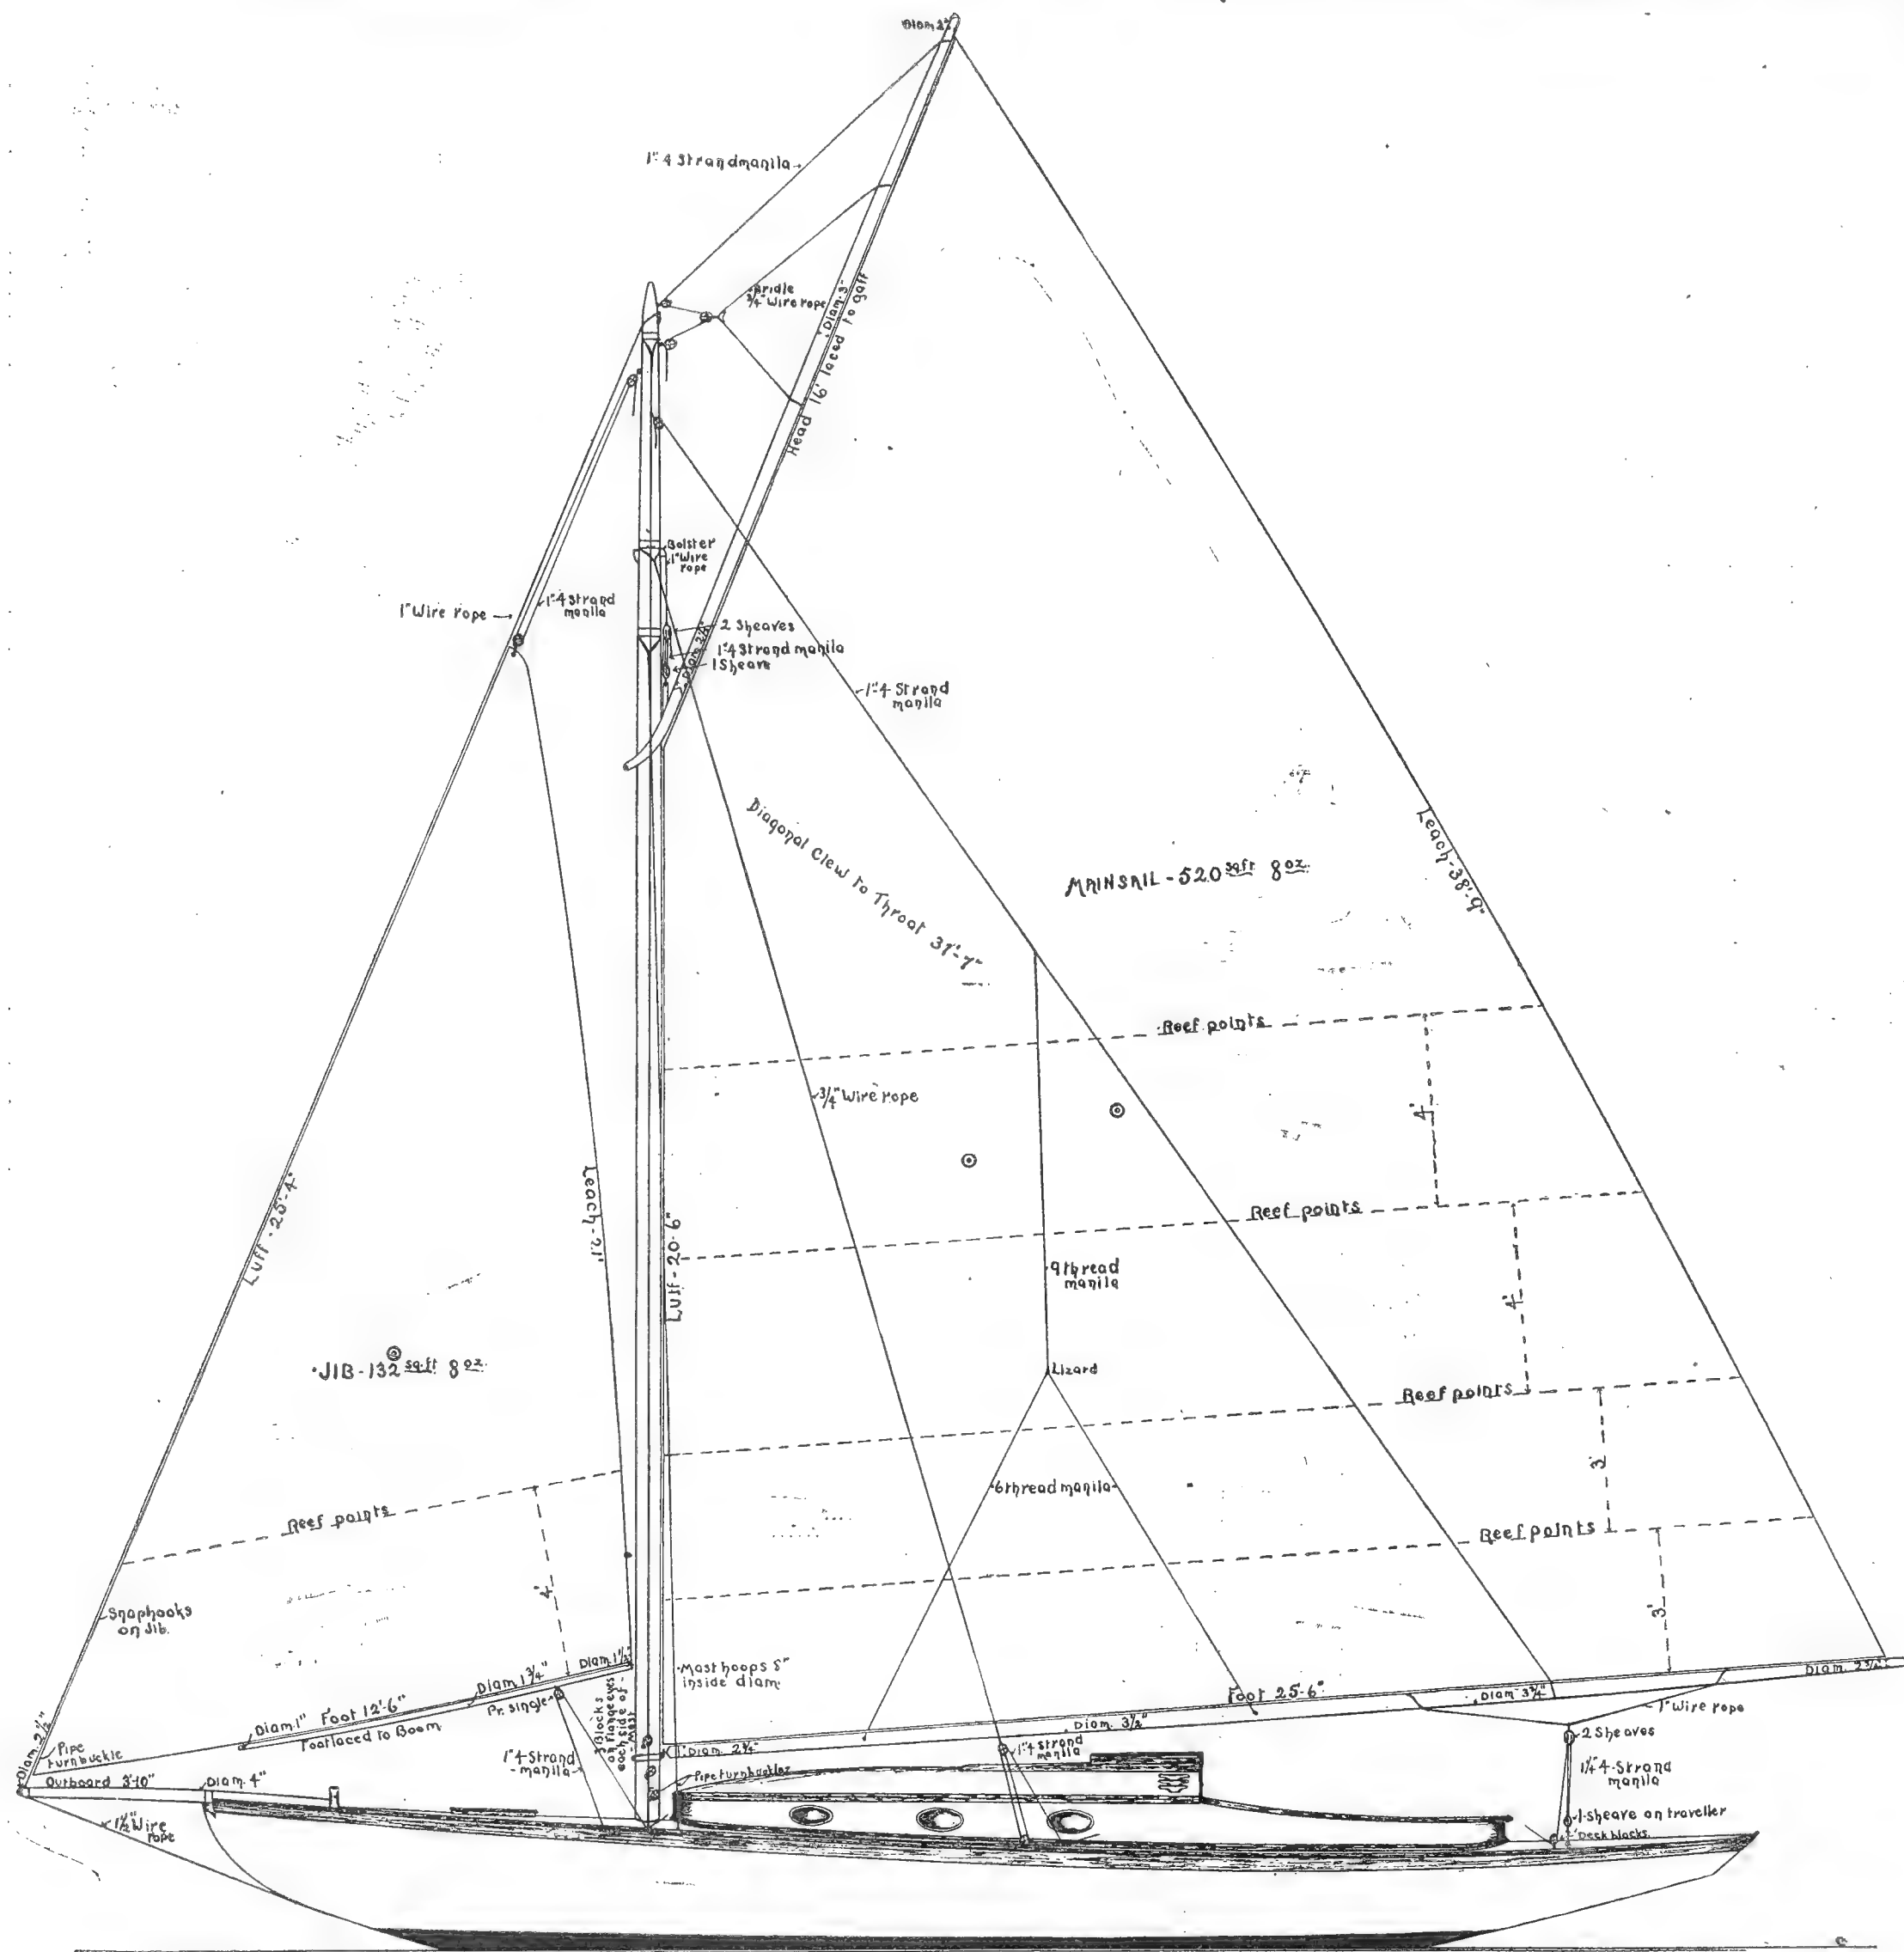

those essentials which made the old "Caper" so popular in her home waters and along the Atlantic coast.

The yacht is of about the same waterline as the average Cape cat, 21ft., with the characteristic midship section and about the same depth of hull. The beam, however, has been reduced and the waterlines better balanced, the bow being filled out and the quarter fined away, greatly improving the main body of the boat, and at the same time the diagonals have been extended fairly and harmoniously for their full natural length, forming good overhangs forward and aft. The least freeboard has been somewhat increased, and the longer ends have made it possible to reduce the freeboard at bow and transom, giving a much more sightly sheer.

The sail plan is from the outset a sloop rig, with mast properly placed, instead of a "morfydite" sloop with mast originally stepped for the cat rig and a jury bowsprit with no support from the hull. The added deck room and better proportioning of all parts gives space for a large cabin house amidships in place of the cramped cuddy of the old catboat, while at the same time the big cockpit that was such a feature of the old boat is retained in the new. While the draft has been increased about 6in., it is

still light enough for general use in all localities along the Sound and the Eastern coast, and the addition takes the form of an iron keel, that makes the yacht practically non-capsizable, and at the same time helps her to windward with but a moderate-sized board, or in fact with no board at all in shoal water.

CENTERBOARD KNOCKABOUT—DESIGNED BY W. H. HAND, JR., 1899.

Mast—		
From stem at L.W.L.....	4ft.	1 in.
Deck to hounds	24ft.	9 in.
Deck to truck	31ft.	10 in.
Bowsprit—		
Beyond stem at L.W.L.....	8ft.	9 in.
Outside gammon iron	3ft.	10 in.
Boom	26ft.	6 in.
Gaff	16ft.	4 in.
Sail Area—		
Mainsail	520 sq. ft.	
Jib	132 sq. ft.	
Total	652 sq. ft.	

One important result of the improved proportions and form is the facility which they afford for a simple and comparatively cheap construction. The fore and aft members, keel, clamps and bilge stringers, can be run from stem to transom in single lengths with no scarfs nor abrupt bends, being easily worked and yet giving great strength with little weight. The old square trunk log, heavy and entailing much labor in the workings, is replaced by a flat plank keel of oak, $10\frac{1}{2}$ by $3\frac{1}{2}$ in., from the scarf of stem to the transom, the arched form serving to stiffen the hull vertically with no weight of deadwoods forward; the iron keel and after deadwoods backing up the middle of the wood keel.

The frames are steamed and bent, sided $1\frac{1}{4}$ in., moulded $1\frac{1}{2}$ in. at heels and $1\frac{1}{4}$ in. at head; spaced 10 in. The clamps are of oak, $2\frac{1}{2}$ by 2 amidships, and 2 by 2 at the ends. The bilge stringers are of yellow pine, 5 by $1\frac{1}{2}$ amidships and 2 by $1\frac{1}{2}$ at the ends. The main deck beams at ends of trunk, are of oak, $2\frac{1}{2}$ by $2\frac{1}{2}$; the others, $1\frac{1}{4}$ by $1\frac{3}{4}$. The planking is of $\frac{7}{8}$ in. white pine. The cabin is 11 ft. long and 6 ft. 9 in. wide, with 4 ft. 8 in. head room. The cockpit is 6 ft. 3 in. long and 6 ft. wide.

Gasolene Engines and Launches.—III.

BY F. K. GRAIN.

(Continued from page 176, March 4.)

INSTALLING.—Next we come to the matter of installing the motor in boat. If possible, by all means put it in the stern, and place the gasolene tank in the bow. Fit some good hard wood keelsons on top of the timbers running parallel with the keel, but in no case allow the timbers to rest on the planking; place your motor on these timbers, using as many of them as possible. Then bore down through the bolt holes in your motor, and through the bottom. Have bolts made to fit these holes, with flat heads on the outside, and good nuts inside, this will hold the motor in place as long as the bottom remains in the boat. Be careful to have your shaft, bearings, etc., in perfect line with motor. Do not place motor too low down, as it only makes it more liable to injury from slopping of bilge water, it also makes it more unhandy, and sometimes very difficult of access to clean or repair.

For the hot air and exhaust connections use common iron pipe, but for the water pipes by all means put in brass, and in both cases use unions with ground joints for connections. The gasolene pipe should be of heavy lead, not less than $\frac{1}{4}$ in. inside diameter, and should have a brass union and stop cock at motor and tank ends. A copper tank should be used for the gasolene and provided with one or more bulkheads, or wash boards inside in order that the fluid will not swash when the boat is laboring in a seaway.

Your batteries should be placed in a dry locker or forward, with the tank, and in racks so that they cannot fall out or tip over; they should be located where they will at all times be accessible.

DIFFICULTIES TO DETECT AND OVERCOME.—We will now assume that you have your motor in place and have learned from the book of instructions how to operate it. Something goes wrong, however, and the question arises, What are you going to do? Suppose your motor thumps or pounds; in most cases a few raps of a hammer driving in the key holding the fly-wheel will help matters; fly-wheels generally, particularly on gas engines, are prone to work their keys loose. Perhaps the trouble still continues; look at the crank pin brasses on the connecting rod, throw the motor on its upper or lower center, place the second finger on the brasses over the joint between the upper and lower halves of the brasses, now move the fly-wheel from side to side so that the piston will travel over the center and back again, then, if your brasses are loose you will at once feel it. They must, however, be tightened with great care.

If the noise still continues, look next to the set screws in the shaft coupling, this failing, you will do well to experiment with the firing mechanism; it may be firing either too early or too late, which will cause a thumping. With most all motors either an excess of or insufficient gasolene, which causes either an early or late ignition, will produce the same trouble. If you do not get a clear, sharp, even, exhaust, it is as a rule caused by insufficient atmosphere in the mixture of the gas. A lack of air will also cause your motor to act sluggishly, and to produce the best results it is always well to give your vaporizer all the air possible, it not only produces a good, quick, easy action to the motor, but prevents any residue overcharged burnt gas from forming a deposit of dirt in the cylinder and valves.

By giving the motor more or less air, the speed can be controlled, but we strongly advise you against this practice; it is not only bad for your vaporizing apparatus, but harmful to the motor in many ways. Be sure your sight-

CENTERBOARD KNOCKABOUT—DESIGNED BY W. H. HAND, JR., 1899.

DETAIL OF KEEL

feed cylinder lubricator is working, and always start it feeding before you start the motor. If there is a grinding, rubbing or squeaking noise that seems to come from the cylinder, it will in most cases be found that the cylinder is not getting sufficient oil, in which case open wide the feed screw or lubricator, and cause the cup to flush a quantity of oil into the cylinder at once. While on the subject of lubrication let me say it is of the utmost importance that all parts, especially the cylinder, should receive a sufficient supply of the best lubricating oils.

Now your motor is running along, and all at once there is a kick, as if something inside the motor had hit and obstructed it for a fraction of the stroke. Also, there may be a puff of smoke from around the valve stems or igniter spindle, and in many cases out of the exhaust also; this is caused by what is known as a late or back explosion, that is to say, the gas is too poor in gasoline, causing it to fail to thoroughly ignite until the piston is about on its lower center. The remedy, of course, is to give the vaporizer less air.

Skipping explosions is a very common occurrence, and is in most cases laid to the batteries becoming weak. This is, however, not by any means the cause in every case, and many times the igniter spindle or shaft fits so tight that when it becomes hot and expands, the spring that operates it is not sufficiently strong. Do not tighten the springs except as a makeshift, but remove the spindle and ease it up a little with fine emery cloth, this not being at hand scrape it with the back of a knife, but never attempt to file it.

The wires connecting the batteries together, also to the motor, are liable to work loose, and, although they may not look so, will often be found by testing the thumb screws to be ready to drop off. It often happens that in the use of old or cheap insulated wire, that, although it looks all right, and the covering perfect, the wire inside will be broken, and as the motor vibrates, these ends will make and break the circuit. Care should be taken to keep all the poles, on both batteries and motor, bright and clean.

In motors of the two-cycle type failure to ignite on starting is at times caused by the gas being too rich, it in many cases igniting once or twice, and then after turning the fly-wheel until tired, the operator gives it up. This rich gas must be gotten out of the motor before it will ignite, and if there is no outlet at the top of cylinder it is apt to stay there to a certain extent. It is always best to have an air cock of say 1/4 in. size tapped into the cylinder head so that in such cases the cock can be opened, allowing the gas to escape and fresh air to be drawn in on the motor being turned, taking care to shut off the gasoline supply entirely.

LUBRICATION.—Want of lubrication or dryness of the cylinder will at times cause the motor to diminish its speed and will result in the stoppage of the machine if allowed to continue, also cutting the surface of the cylinder and piston ring. It often produces a rubbing and squeaking sound. To trace out a foreign sound, locate as near as possible the affected part, then take a stick the size of a lead pencil, place one end on the suspected part, holding the other end between the teeth, holding both ears closed. It will be a surprise how clearly a sound of any kind can be located by this means.

DANGER FROM OPEN COCKS.—Never place any part of the body in range with an open cylinder or relief cock when handling the motor, as when the charge is ignited these cocks discharge burning gas.

THROTTLING.—Gas engines cannot, for numerous reasons, be throttled down as low as steam or other constant pressure motors, and care should be taken when doing this or approaching a dock, as a failure may at a critical moment result in the stoppage of the motor, leaving you helpless to control the boat.

A Few Wrinkles.

OILERS.—Oil cans can be had in copper and brass, of all shapes and sizes, but the most useful is a common zinc one-pint oiler for machinery oil, and for the cylinder oil a ten cent tin (one quart) coffee pot is the quickest feeder and handiest can to be had.

OILS.—Always use best and pure oil, a little at a time, and often, is the invariable rule. Do not put graphite in your oil, as they are especially made for that purpose.

CLEANING LUBRICATORS.—To clean the lubricators use gasoline, the same will clean them, and also all grease in the bottom of your oil can. The cock put

in your gasoline tank so that you can draw off gasoline for cleaning independent of your motor connections.

CLEANING MOTORS.—Don't wipe your motor after using, the oil will keep it from rusting. Clean it before use.

RUST PREVENTER.—To keep springs and bright parts from rusting, oil them when they are hot.

CLEANING BRASSWORK.—After cleaning your brasswork, if it is to stand any length of time, cover it over with vaseline, it preserves it from corroding, wipes off easily and does not hurt the hands. Treat your wrenches and tools the same way. A small paint brush is the best thing for putting on vaseline, as you can reach the small places most apt to rust and hardest to clean.

Do not cover your motor, whether in open or cabin boats, as it causes it to sweat and consequently it will rust quicker than if exposed to rain.

LEAKY JOINTS.—If joints of cylinder, etc., leak, repack them, using thinnest asbestos paper; be sure the surfaces are perfectly clean, then give both surfaces and paper a coat of shellac before putting together.

TIGHTENING BOLTS.—To tighten up bolts of cylinder head or any similar place, start by putting down one moderately tight, then follow with the opposite one, then the one at right angles, working from side to side, and after all are in place and tight, follow in like manner and screw down hard.

JOINT FINISHES.—Shellac is the best medium for use on all joints, either flat or threaded, as it is not affected by gasoline; common brown soap is a good substitute, and leaks in gasoline tanks can often be temporarily repaired with a piece of soap stuck on over the leak or forced into a seam.

DEFACING SURFACES.—Do not pound on any of the metal parts of your motor with a steel hammer or wrench, as it is sure to deface the part struck. Hold a piece of hardwood on the part to be struck, or still better, provide yourself with a copper hammer, it is always useful.

Do not use a pipe wrench on a nut or any surface that is liable to be defaced; if you must, wrap a piece of tin around the object or stick a piece of wood under each jaw of the wrench. If you have use for a pipe wrench and have none, put your monkey wrench over the object and then hold a file into the angle between the object and the forward jaw of the wrench. If you have a pipe to take down that is too large for your wrench, make a loop around it with a piece of marlin and then around a stick, using the latter as a lever and pry against the slip of loop.

Nuts, pipes, etc., that will not move readily, can be started by pounding all sides with a hammer, holding an iron or stone weight against the opposite side, then apply wrench.

PAINT FOR MOTORS.—Good paint for gasoline motors are the various bronze powders put on with shellac. For very hot pipes, common stove blacking is as good as anything, and always leaves the pipes clean.

CEMENT FOR FOUNDATION.—To mix cement for foundation under or filling around motor, use one part Portland cement with two parts clean sharp sand mixed with fresh water.

SPARK COIL AND CONNECTIONS.—Keep your spark coil dry, otherwise the iron wire core will rust and spoil it, if the coil becomes thoroughly wet, it will short circuit and become useless until dry. Always keep connections on ends clean, and in good contact. A good plan is to fasten the coil up under a dry place under the deck, first having it nicely boxed.

SWITCH.—The points of your switch will often corrode and should be scraped or sand-papered off occasionally. A good serviceable switch is made by fastening a brass screw into the bulkhead, attached to one wire, then place another attached to other end of wire about 3 in. below the former, connect the two by the means of a spiral brass spring, having the spring fastened permanently to one screw, and on other end turn a loop. To connect draw spring down and hook loop over the under screw head, this makes a good connection that is not knocked off or disarranged easily.

PACKING FOR SHAFT.—To pack stuffing box of propeller, get square Italian hemp packing laid up in grease, cut a piece that will reach around the shaft, first binding both ends with thread so it will not unravel, then fill stuffing box half-full of grease and with a stick of proper size force the packing down into the bottom of the box, put in another proceeding as before, taking care to break joints

with the packing, fill the box about half-full, then replace gland and screw up moderately tight, then slack away one or two turns backward on the gland, so that the packing does not bind shaft. If ready made packing is not at hand, use lamp wicking, braiding it round in four parts, first greasing the strands so as to braid in the grease.

WIRE CONNECTIONS.—In making all wire connections always coil the wire a half-dozen times over a lead pencil at the ends, as this allows for breakage, wear, and makes a flexible joint not liable to pull or jar off the connection.

KEYS.—If the key of fly-wheel works loose, cut a strip of thin tin from top of a milk can, or a tin type will answer still better; put this in on the slack side of the key and drive both in, taking care not to buckle up the tin.

PUMP.—If your pump refuses to work on first starting hit the inlet check valve or pump a sharp rap with a stick, and nine times out of ten your difficulty is over. Pumps need repacking, and also tightening up on the packing at times, when this occurs use great care not to get the packing screwed down too tight or it will either buckle the connection or cause the packing to cut the plunger.

USE OF LEAD ON JOINTS.—Never use either black, white or red lead on any joints on a gas motor or its piping, as the gas will cut it out in a short time.

[TO BE CONTINUED.]

The Conversion of Inyoni.

BY COLONEL BARRINGTON BAKER.

From the Yachting Monthly Magazine.

The mainsail was then reduced to 1,200sq. ft.; 3ft. was taken off the foot of the spinaker, some slight alterations to the sharp-headed topsail (the only one I take when cruising), and about 6 in. from luff of No. 1 jib—nothing else required alteration. The jackyard, topsail can still be used for racing, and of course both jibtop-sails fit, and are very handy in light airs.

She steered easily in moderate winds; but when she got her sail down in a strong breeze she wanted more weather helm than I liked, so I gave her a new bowsprit (only a stump, after all), 18 in. longer, and now she steers beautifully in any weather.

She is quiet in a seaway and easily handled. Our crew this summer has usually been three ladies and two other amateurs, beside myself (no paid hands), and we have had some rough weather off the Longships and Lizard,

in which she behaved very well. We worked her six miles up the Fal to Tregothnan Pool in a strong N.W. wind, which is a good proof of her handiness; and we logged 21 knots from Falmouth to Fowey in two and a quarter hours, i. e., nine and a half knots an hour, towing our boats, one of the girls steering all the time; wind, N.W. strong.

We find a Simplex stockless anchor of 112lbs. most useful, and I think this pattern holds as well as that of any other of the same weight, but I also think it requires more scope of chain.

Inyoni's dimensions are now as under:

Length—	Over all.....	67ft. 7in.
	L.W.L.	46ft. 9in.
Beam		12ft. 10in.
Depth to platform		6ft. 5in.
Draft		8ft. 9in.
Displacement, about.....		25 tons.
Lead keel, etc., about.....		13 tons.
Area—		
	Mainsail	1,200sq.ft.
	Jib	270sq.ft.
	Foresail	220sq.ft.
	Topsail (cruising).....	200sq.ft.
Total cruising sail (exclusive of spinaker) ..		1,690sq.ft.
Total Y. R. A.....		2,510sq.ft.
Two boats on davits.		

PUBLISHERS' DEPARTMENT.

The Week's Record.

This is the Way Advertisers Esteem "Forest and Stream" Advertising.

Dan Kidney & Son, boat builders, of West De Pere, Wis., write: "Please keep our ad. in the FOREST AND STREAM till we tell you to take it out. It is good enough for us." The Chicago Varnish Co., write: "Inclosed please find contract for our advertisement in your paper for the following year. We are glad to renew the contract, as we feel that we get good results from it."

Both Ways Across the Pond.

FOREST AND STREAM advertising covers the world. Messrs. W. J. Cummins, of England, tell us that their advt. in FOREST AND STREAM makes business for them on this side of the Atlantic, and in return the Horton Manufacturing Co., through the same medium, have been filling orders for the Bristol steel rod to go to Great Britain. Christiania, Denmark, sportsmen are luring game with the Canvas Decoy Co.'s artful simulacra, and they found out about them in FOREST AND STREAM. The world is small when you use FOREST AND STREAM to encircle it.

O. C. MARSH.

PROFESSOR O. C. MARSH, the eminent paleontologist, died at his home in New Haven, Conn., on Saturday, March 18, aged sixty-seven years.

He was born at Lockport, N. Y., in 1831, graduated from Yale in the class of 1860, and devoted the next five years to the study of science at New Haven and in Germany. In 1866 he returned to New Haven to occupy the chair of paleontology, which had just been established for him, and which he continued to fill to the time of his death. His labors in science were purely those of love, for he received no salary from the university, and besides, up to the year 1882, he himself paid the wages of many of his assistants.

Professor Marsh's services to science were very great and of many sorts. It was through his influence that his uncle, George Peabody, of London, gave to Yale the fund from a portion of which the Peabody Museum at New Haven was built. He superintended the construction of this building, of which he was Curator, and it was his hope that he might live to see the central and main structure completed.

In 1868 Professor Marsh made a short excursion to the Rocky Mountains, and from information acquired on this trip, he learned and appreciated, as no one else had done, the vast possibilities of the western country as a field for the collection of vertebrate fossils. In 1870 he took out West the first of the expeditions, which afterward became so well known, and which in later years have been followed by so many similar expeditions from other institutions of learning. These parties, and others which followed them, gathered the treasures which made Professor Marsh's collections famous throughout the world. Of them Professor Huxley said in 1876: "So far as my knowledge extends there is no collection from any one region and series of strata comparable for extent, or for the care with which the remains have been got together or for their scientific importance, to the series of fossils which he has deposited there." Charles Darwin wrote: "Your work on these old birds and on the many fossil animals of North America has afforded the best support to the theory of evolution that has appeared within the last twenty years."

The number of new forms of animal life brought to light by Professor Marsh's researches is very great. Among them were the first monkeys, bats and marsupials discovered in America, besides such amazing forms as birds with teeth, vast and monstrous forms of dinosaurs, remarkable pterodactyls, or flying reptiles, and the strange many-horned dinocerata and brontotheridæ. The titles of his papers on scientific subjects number many hundreds, and he was the author of several elaborate quarto monographs, among them being one on Birds with Teeth, on huge Dinosaurs and on the Dinocerata. His demonstration of the ancestry of the horses many years ago attracted wide popular interest.

Although so enthusiastic a devotee of science, Professor Marsh was also a keen sportsman; an exceedingly good snap shot and an expert fly-caster. The work of collecting fossils on his Western trips was varied by big game hunting, grouse shooting and trout fishing, and in all these different pursuits Professor Marsh proved himself skillful and successful.

In his earlier expeditions to the West, it was often necessary to pass over the hunting grounds of hostile Indians, and so to have the protection of escorts of United States troops. But it was not only on hostile grounds that he met the Indians. In 1875 he learned of the Indian Bureau frauds committed on the Ogalalla Sioux, and called public attention to them; a course which led to a great improvement in the Indian service. Old Red Cloud and the other chiefs of this band ever afterward held Professor Marsh in grateful remembrance for his services to their people. Professor Marsh's achievements received the

high appreciation of scientific men. He was a member and fellow of many European scientific societies, had been President of the American Association for the Advancement of Science, and of the National Academy of Sciences.

A little more than a year ago Professor Marsh presented to Yale University his six superb collections of vertebrate and invertebrate fossils, osteology and ethnology to be forever held by it under the charge of the trustees of the Peabody Museum.

SINNAKER BEARS.

In recent communications from North Carolina, Mr. Charles Hallock has several times spoken of a particularly large, powerful and ferocious sort of bear, known to the North Carolinians under the name of sinnaker or sinnaber, the last probably being merely a misprint. He speaks of these as "cattle bears," not "hog bears," the distinction carrying with it the idea of strength and energy. Some curiosity has been manifested as to the etymology of this word, which in fact is interesting.

In the history of the early settlements of Virginia and North and South Carolina, there are frequent references to the "Sinnagers" whose ferocity is dilated on and whose cruelty is complained of. This word, "Sinnager," appears to have been a generic term applied to all tribes of the northern Iroquois, and is unquestionably merely a different spelling of the word Seneca, one of the prominent tribes of the Six Nations which made up the powerful league of the Iroquois, long famous as the most advanced political institution devised by North American Indians.

Early writers of the southern colonies, which of course means only the narrow fringe of English settlements along the coast, tell us much of the continual raids made by the New York Iroquois upon the Algonquin and Siouan tribes inhabiting the coast region and the higher wooded lands of the southern Allegheny Mountains. So fierce were these assaults and so continuous this warfare, that the tribes attacked frequently appealed to the English for help against their northern foes, and at length a number of them deserted their villages and came to live near to Fort Christian in the hope of escaping the incursions of their enemies. Even this, however, did not protect them, for the Iroquois attacked and killed them under the very guns of the fort. It was not until 1722 that through the effort of the colonists a permanent treaty was made by which the Iroquois agreed hereafter to forego their attacks. The peace came too late to save the southern tribes. Broken and decimated by the hostility of their Indian enemies, and still further enfeebled by their closer association with the whites, they melted away and disappeared, some joining other tribes, by which they were absorbed, while others in small companies moved away westward and in name still exist, though represented by few or no individuals of pure blood.

That the word Sinnaker should have persisted as a local term for 250 years is certainly interesting. Originally applied to a people possessing certain characteristics, it came at last to stand for those characteristics, and finally became merely an adjective meaning strong, fierce, ferocious and perhaps masterful.

SNAP SHOTS.

We print elsewhere a dissent from some remarks made in these columns last week, the general tenor of which was to point out the futility of the coarse abuse so commonly resorted to in the application of the epithet "game hog" to all whose shooting restrictions were not in accord with the notions of those most given to the use of the epithet when speaking of their fellow men. We allude again to the subject here, to point out that what was written is not to be construed as in any way offering a defense for intemperate game destruction. The particular point referred to by our correspondent, of the fifty-bird bag, for instance, was not a justification of the killing of fifty birds in one day. We wrote:

Fifty birds in Mississippi or Louisiana in a day would be far less relatively than five would be in Connecticut. Fifty birds might serve to supply one man with an abundance of game; the same amount might be wholly inadequate for the needs of another. One man might shoot one day in the year and kill one hundred birds; another man might shoot ten days and kill ten birds on each day, so that the sum total which each one took was the same; yet the ten-bird man might feel that he was warranted in denouncing his fellow as a "game hog."

It was rather to suggest that the spirit controlling the killer of the five might be precisely that of the killer of the fifty, each being governed by his opportunities; and the killer of five thus being without his justification in denouncing a brother, whose score was fifty.

Much of this "game hog" denunciation is in truth an aggravated case of the very black pot calling the kettle black and there is no greater humbug in the history of field sports than some of this same "game hog" reiteration, by those who are intent by vociferous and shrill-keyed outcry upon concealing their own brutish performances as wanton destroyers of animal life, game and otherwise. Mr. Schenck tells us that he now views the making of a large game score in a light different from that in which he regarded it years ago; and in this he is relating an experience common to most of us who learn wisdom as we count the years behind us. But will he go a bit further, and tell us whether the change was wrought in his heart because some holier-than-thou brother pointed the finger of scorn at him and objurgated him as a "game hog?"

The notes with the photographs of captive moose in the Providence Park, which we publish this week, deserve more than a passing mention. Mr. Talcott's observations, though not very long extended, are interesting and valuable, and furnish a good example of the useful work that may be done for his fellows by an intelligent man who is willing to take the trouble to observe, and to set down on paper the things which he sees. It must be acknowledged that the ability to see, and the impulse to write down what has been seen are not too common. It is gratifying to receive from old friends, as we so often do, notes of real value. Mr. Talcott's observations on the increase of the moose's bell during the growth of the antlers, and its decrease in length after the antlers drop off are of extreme interest, and so far as we are aware this phenomenon has not hitherto been noted. It suggests a number of interesting questions. We do not know that the function or purpose of the moose's bell has ever been determined; but these observations would seem to indicate that bell and antlers are subject to the same influences. As the antlers grow large, the bell increases; when the antlers disappear, the bell grows smaller. Now the antlers, of course, are a part of the moose's breeding dress. Is the bell also a part of it? Among birds remarkable changes of dress—usually decorative—commonly take place at the approach of the breeding season, and special appendages often make their appearance at this time, of which the breeding plumes of herons and the crest on the pelican's bill are familiar examples. These like the antlers of deer are directly connected with the reproductive function. Is the moose's bell an ornament of this nature?

The Albany Senate bill No. 179, introduced by Mr. La Roche to restore spring shooting on Long Island, opening the season May 1, should be opposed, and is actively opposed by friends of protection. Mr. Robert B. Lawrence, Secretary of the New York Association for the Protection of Fish and Game, described the situation succinctly and accurately when he said that, whereas, because of the dearth of game at the time when the law against spring shooting was originally under discussion, the marketmen did not think it worth their while to oppose the measure, now, when in consequence of the operation of the law the game stock has been replenished, and there is something for them to shoot in the spring, they are bent on the law's repeal. In this new condition of a restored game supply for Long Island is found the unanswerable argument for the retention of the law which has worked the restoration.

Governor Voorhees, of New Jersey, has named for fish commissioners Messrs. Howard P. Frothingham, of Mt. Arlington, and Wm. A. Halsey, of Newark, Republicans; and Benj. P. Morris, of Long Branch, and J. Frank Budd, of Burlington, Democrats. The Governor has given out that he has the new commission pledged against the reappointment of State Game and Fish Protector Charles A. Shriner, of Paterson, because, as Mr. Voorhees explains his action, Mr. Shriner opposed his election. Mr. Shriner has been an intelligent, alert, discreet, honest, faithful and efficient official; he has conducted his office in a way to serve the public interest in the highest practicable degrees. His dismissal now would be a public outrage.

The Sportsman Tourist.

An Alaskan Moose.

THE first of March, 1898, found me in company with my partner and several thousand others, bound for the interior of Alaska on a prospecting trip. In making such a journey, where everything has to be packed by man or animals, every pound of unnecessary weight must be dispensed with, and therefore I was for some time in doubt as to whether or not it would be advisable for me to take in my rifle and a stock of ammunition. As to this, I consulted with several old miners residing in Victoria, B. C., who had been in Alaska, and they unanimously advised me to take my rifle by all means, as, if I should be so fortunate as to secure a single caribou or moose, it would more than repay the trouble the rifle and cartridges would occasion.

We arrived in Skagway on March 11, and, after a month of severe physical toil, had packed and sledded our outfit as far as the middle of Marsh Lake. Here we went into camp while we constructed our boats, suitable timber being found about a mile back from the lake. Trees were felled, sawpits constructed, and whipsawing begun, and by May 4 we were ready to start on. Our boats were well made. They were double ended, 30ft. long over all, 30in. wide on the bottom at widest part, and 5ft. wide on top. The bottoms were of 1in. and the sides of 3/8in. lumber. They were well stiffened by longitudinal strips, and, though capable of carrying safely 3,000lbs. and two men, they were easily carried by three men. For our party of eight, we made three boats, but found it necessary to construct a fourth boat to relieve the others, as they were far too heavily laden for safety. This we did at a point about fifteen miles above Miles Cañon.

At this time there were immense numbers of geese in the country, feeding on the flats, from which the snow had recently melted, but they were very difficult to approach, and we did not succeed in getting any. There is a splendid fish, a species of trout, I believe, very abundant in Lake Marsh. We did not succeed in catching any, though we saw many, but I was told afterward by a man who daily secured a plentiful supply, that he learned from an Indian that in angling for these fish it was necessary to allow the bait to move about on the bottom and agitate the mud slightly. This procedure, it seems, imitates to a certain extent a small crawfish, upon which these fish feed extensively. There is no large game to be found in the vicinity of the river and lakes forming the highway of the miners, but the Tagish Indians kill moose at some distance back from the lakes among the mountain valleys.

On May 12 we ran our boats through Miles Cañon, lined them through the White Horse Rapids, and on the 16th had gone into camp on Lake Le Barge to await the breaking up of the ice; then too weak to bear our weight and too strong to force the boats through. Little game is to be found in this vicinity. Lake Le Barge has for years been a halting point for the miners, and, as many of them improve their time hunting, game is correspondingly scarce. One party succeeded in bringing in a mountain sheep—all the game they saw—but stated that they had crossed over three ranges of mountains to find it. Another party had killed two bear, and still another a moose, but hundreds returned from the hunt empty handed. I spent two days in a vain search for game, seeing nothing but a spruce partridge similar to that found in the spruce and tamarac swamps of northern Minnesota. There are numerous fish in Lake Le Barge, similar to those in Lake Marsh. Many of the miners were provided with gill nets, and these men had plenty of fish. I did not see or hear of any being caught with hook and line.

On the 26th we had succeeded in making the foot of the lake, and next day ran the gauntlet of Thirty-Mile River. On the 29th we lost the contents of one boat in the Five-Finger Rapids, and, after taking a day to dry out, arrived at Fort Selkirk on the afternoon of June 1. Here the party divided. Three went on to Dawson, but the rest of our party determined to go prospecting up the McMillan River, which empties into the Pelly about eighty miles above the confluence of the latter with the Lewes to form the Yukon at Fort Selkirk. Taking with us about two months' supply of provisions and securing suitable poles, we began poling our two boats up the swift Pelly, now at flood stage. When only four miles above Fort Selkirk we found it necessary to wait until the flood had somewhat abated, and so lost two days.

There were several parties ahead of us, and more than 100 to follow, but owing largely to the superior construction of our boats, we had no difficulty in overtaking and passing everyone. It was hard work. The river was deep and very swift; sweepers innumerable hung out from the bank and had to be cut before we could proceed. There is little chance for towing, so steep are the banks and so dense the growth of willows thereon. There are no very serious obstructions to getting up the river. In many places, it is necessary to haul the boat by main strength past some projecting rock, so swift runs the current. One place in the Pelly Cañon it is necessary to climb up on a high rocky point then down on the other side to the edge of the rim, where a float is tied to the end of the tow-line, and by this means it is passed down around the rock, where it is made fast to the boat to be hauled up. In rounding this and other rocky points in this manner, it is essential that the one who steers the boat keep the stern well out into the stream. The tendency of the eddy is always to throw the stern up stream and the bow down, thus causing the broadside of the boat to be presented to the swift water, with the result that the boat will be capsized, or the tow rope dragged from the hands of those hauling on the line.

On June 9 we left the Pelly and entered the McMillan. After passing the mouth of Kalzas River, the next day, which connects a lake of the same name with the McMillan, we saw nothing whatever to indicate that white men had ever preceded us. There were, however, occasional deserted fish camps of the Indians, but as we progressed, these became less frequent, and finally ceased altogether. That they do reach the extreme head waters of these rivers at rare intervals, I have no doubt, for I myself found the remains of an ancient camp near the headwaters of the McMillan, and fully 2,000ft. above the level of the stream. While on the Pelly, we saw no game and

very little signs of any, but as we poled our way up the McMillan, we saw increasing indications that we were in a big game country. Tracks of moose and bear could be seen along the banks at almost any time, and judging by the havoc wrought among the willows and balm of Gilead trees there were plenty of beaver, though we did not see many.

The mosquitoes were now as bad as at any time on the entire trip, yet no worse than I have seen them in the jungles of the Orinoco River delta, and not nearly as bad as I have encountered in northern Minnesota. We were provided with good nets to cover our beds, and did not suffer any very unusual annoyance. The big stories of the Alaska mosquitoes apply to the country around Circle City and Fort Yukon.

After having poled our way up stream for twelve consecutive days, we made a camp and spent ten days prospecting without result. Then we continued up the river five days more, and again constructed a prospecting camp. At this time we were joined by two more men, who had followed closely behind us from our last camp, and when we started out prospecting, we went for convenience in three parties, each intending to be gone a week. At the end of that time, two of the parties came in empty handed, but the third brought in about four dollars' worth of gold, which they had panned off the rimrock about twenty miles up one of the mountain streams. Next day we all set off for the scene of the discovery, where, after panning a few pans to satisfy ourselves as to the value of the discovery, we pitched a camp and agreed on plans for working.

We had now been over four months without fresh meat, and as mine was the only rifle in camp, I was frequently requested to try for some moose meat. So one day at noon I threw down my pick and announced that I was going for that moose. After some simple preparations, I set off up the valley of the creek upon which we were camped. My rifle is a Winchester .40-65, fitted with Lyman near sight, and a strap for carrying. It weighs nearly 10lbs., and is a splendid shooting gun. With it I have, while in South America, killed alligators 8ft. long dead in their tracks. Beside my gun, I carried my machete, which I had also used in South America, and it served the double purpose of knife and axe.

I proceeded up the stream very leisurely, seeing many signs of bear and moose, but none of the animals themselves. After passing a willow marsh bordering the creek and situated between low hills, I came to a lake about an hour before sundown (10 P. M.), and concluded to watch for a time. It was very still, the wind just a breath from no direction in particular. Two miles to the northeast a noisy stream from the snow-clad heights above poured its icy waters into those of the lake. To the west and north lay a huge mountain, upon the sides of which grew a remarkably thick growth of spruce to an altitude of about 600ft. above the lake. Above that only brown grass could be seen to the snow line. Far away among the mountain crags I could hear in the perfect stillness of the summer night the ba-aa of the mountain sheep. It was not dark, though the sun was below the horizon; a strong twilight made objects almost as distinguishable as in daylight.

I had not long to wait. As I lay wrapped in my blanket—for the night was chill—watching the shore of the lake and the dense growth of spruce above, I saw four dark objects move into a small opening on the hillside, and a second glance showed that they were moose, three of which had horns. They were about 600yds. away, but were working toward me, browsing as they came. As I watched them from a thick growth of stunted mountain birch, it seemed as if they intended to enter the lake at a point about 200yds. from me, and wishing to shorten the range, I crept along the shore of the lake for some little distance. From my new place of observation, I could see the moose continue to approach, but before they were within range, they changed their direction, entered the thick growth, and I saw them no more.

At midnight I decided to change my position, and so moved back down the creek to a knoll near the center of the willow marsh before mentioned. From this knoll I could watch a grass marsh adjoining the willow marsh which I particularly desired to do, for in my ignorance of the habits of the moose, I supposed they fed on grass whenever it was obtainable. By creeping through the stunted willows with which the knoll was covered, I could see a considerable portion of the willow marsh, and I examined this carefully at intervals of about fifteen minutes.

About 3 o'clock in the morning, just as I was about to creep over to scan the willow marsh, I plainly heard a maugh! of a moose and knew that my chance had come. Seizing my rifle, I crept rapidly through the willow, and there in the clear morning light stood a large bull moose with a magnificent set of horns, about 100yds. away, quietly browsing the tops of the willows, and utterly unconscious of my presence. I will never forget the sight. For a moment I was lost in admiration and felt loth to destroy, but a recollection of my hungry companions as well as my own cravings overcame my scruples, so I raised my rifle and making allowance for the hump on the shoulders, took careful aim and pulled the trigger. The cartridge did not explode, the moose heard the sharp click of the hammer and started to trot off. In the next ten seconds, I fired five shots at the moose whenever he appeared through the trees, four of which, we afterward found took effect. He ran in a semicircle with me as a center for about 100yds., finally stopping in plain sight about the same distance away as when I first saw him. The next shot was aimed at his fore shoulder, and I plainly heard the bullet strike the massive bones. Down he came with a grunt, and the deed was done.

What a problem presented itself to me then. I know nothing of butchering, but after a few trials, I succeeded in cutting off a hind quarter, a portion of which I carried to camp, where, you may be sure, I was accorded a royal welcome. Mining was for the time being suspended, and all hands returned with me to bring in a load of meat. One of our party, an Australian, was familiar with the butcher business, and under his skillful manipulation, the moose was skinned and the meat separated from the bones in a very short time. It was a matter of deepest regret with me that I was unable to preserve the magnificent head. The spread of the horns was several inches over the length of my rifle, and they, together with the head and a short portion of the neck,

must have weighed over 200lbs. Yet I would have cheerfully carried this load the thirty miles to the boats had there been any possibility of getting it to a taxidermist before it spoiled. How I wished for my camera! I laid the head reverently aside, and with genuine sorrow left it to waste and decay.

Though we ate as only hungry men can eat, the meat lasted us a considerable time. A rack was built, the meat hung thereon, and a fire kept smoldering beneath for several days. Very little of that moose went to waste. A week later, I chanced to pass the spot where the moose was killed. Not one bone remained attached to another. The bears had been having their turn. The splendid horns were in the velvet, and all the points were gnawed down. The skin was torn to shreds and dragged several hundred feet.

Though it is not at all probable that any of the readers of FOREST AND STREAM will ever visit that virgin wilderness for big game, I have no hesitation in saying that if they should, they would be well rewarded. There are no grouse, partridge, squirrels or rabbits to speak of, neither are there any wolves, but bear, moose, caribou and mountain sheep abound. It is not a country for long distance shooting, for the game, never having been molested, is remarkably tame, the bear in particular. There are three kinds there that I have seen, the brown, the cinnamon and the black bear. At one time I saw five brown bears climbing up a bluff. Two of our party had to make a long detour to get past a cinnamon bear that refused to let them pass in a narrow gorge. A brown bear and her two cubs paid no attention to a charge of shot fired, not at but toward them, by one of our party, who was alone in camp, but came right up to the tent and played havoc with the things outside, but did not enter the tent, to the intense relief of the trembling inmate. While making my way with two companions up the narrow valley of a mountain stream, we came suddenly upon a black bear and two cubs feeding in a small grass plot. Thinking to see her run, we shouted, and waved our hats, but to our amazement and alarm, for our only weapon was my machete, she walked deliberately up to within 40ft. of us, and then raising upon her hind legs, looked us over critically, while the cubs took to cover. Then she slowly followed the cubs, stopping many times to look at us, as if to warn us not to disturb her in the future. We did not follow.

To reach that far-off country involves some personal risk and a vast amount of severe physical toil, yet those of us who admire nature in her various phases feel well repaid for the trip. Though a desolate wilderness, and destined ever to remain so, there is something indescribably attractive in exploring the country and being the first to set foot in these mountain fastnesses. It is enough to stir the blood of the most sluggish to gaze on those rugged peaks of dizzy height with tops covered by the everlasting snow and lighted by the midnight sun—scenes few human eyes have ever observed; certainly never raised before the eyes of white men previous to ourselves.

W. C. WEEKS, C. E.

Havre de Grace, Md.

A Parting.

WITH the requirements of a duck hunter about us, we waited for the word to board the sloop. There were sounds of creaking cordage, burdens dumped upon decks, and the humming of boatmen's voices about us in the evening air. "It's going to be a kam night, Bill, and we will have to stay at the dock, same as we allus, does, and you city fellers can sleep to the hotel; we'll call yer in the morning." I was grumbling at the decision and about to comply, when the skipper whispered to me: "That's the usual bluff; the laws says you can't go down to the line till sun-up. Sneak on board and lay low; something will happen." It did, and I noticed about 11 P. M. that the lines which held us to our moorings had parted—probably by chafing. The accident was noted by all and the crew labored with poles to push the outfit back to its place. After four hours of work they discovered that the needle of the compass had been deflected by the cast iron stove, and that we had pushed ourselves four miles out into the fog. Discouraged and tired, we dropped the mudhooks and sought rest. I suppose we had the "Larboard Watch" out for safety, or for some time, or for instance.

At times a heavy foot pounded the deck over my face and 6in. above, while I tried to be comfortable in a coffin-like space 18in. wide, 12 high, and 5ft. long. When the feet above did not disturb me, the absence of feet in space and the presence of the feet of my bunkie kept me cognizant of time and wondering how it would seem to be buried alive. We were boarded in the night by a garrulous old neptune, who crowded in among us and kept his yaw pumps working off a stream of personal brag. I have one fairly good ear and one very bad one. When the good ear was down his volubility did not disturb me; when the good ear was up his verbosity was unbearable. A rubber boot shot through the dark cabin in the direction of the voice. On its way it accidentally united with the coffee pot and they landed together on and about the speaker. He had "grounds" for complaint. As an amateur engineer, I explained that the lid to the coffee pot had rusted in place, and this, in conjunction with the fact that a potato had been driven into the spout to prevent the escaping steam, had confined it and an explosion followed. The victim seemed satisfied, inasmuch as he had something else to think about, and he gave his vocal organs and the rest of us a rest.

An hour before dawn we had the double battery anchored and two hundred or more decoys bobbing about it. To those not familiar with this sport, I would state that the battery is a floating platform about 8 by 10ft. square; in the center and in direction of its length are two depressed boxes barely large enough to admit a man's reclining body; on the outer edges are hinged flaps of canvas that rise and fall with the waves and prevent the wash of water from filling the sunken parts; the whole is nicely ballasted with iron decoys, and this weight, with that of the occupants, sinks the whole to the level of the surrounding water.

My companion of many trips wished me, as usual, to have the best of everything, and insisted that I take the

first spell. When the first gray light appears, when you hear the honk of the wild goose and the quack of the mallard and see not, when single dark objects come slatting by in the mist like shots from modern ordnance, when whole flocks of ducks come upon you like the rush of cavalry and break to the right and left and you rise up to juggle your fowling-piece for their destruction, then does your blood tingle, your deep breath come and go quickly, and you feel the spirit that has animated man from primeval times to the present and will continue to so stir them till long after the last sparrow falleth.

The guns boomed again and again in the dense fog and canvasbacks, mallards and redheads struck the water with a sloping splash, never again to travel north or south with the changing seasons. The sound of oars creaking in their locks and of broken waves slapping under the bow of an approaching boat warned us that we were called in for breakfast. Ten handsome birds satisfied my desires, and I did not enter the battery again. At other times have I lain flat in the battery and stuck up a foot to attract the ducks; times when far away could be seen some hurrying bird flying low and with tremendous speed, ready to alight among supposed kindred. When the bird discovered the nigger in the wood-pile the attempt to back-pedal or to fly off on a tangent was ludicrous.

My companion drank much of the Chesapeake Bay water, contrary to advice. He was reminded that he was not in the best of condition and that such water was usually saturated with deleterious substances.

Climbing the hill that night to the railroad station my foot unearthed a stone tomahawk, a relic of the fierce tribes whose habitat was the Susquehanna. It may be that the relic split the head of some good Fennimore Cooper Indian, or was the first implement used in a feast of boiled dog.

Having but little time for a change of cars at Philadelphia, we employed the Pullman porter to transfer the ducks. In doing so he was chased by a Philadelphia bobby, who evidently thought the goods were hypothe-cated. Maybe he liked ducks. It took some persuasion to convince him that we had shot them; it took more to convince him that he had displayed a wonderful burst of speed considering his locality.

Part II.

With those who sneer at the lovers of the rod and gun and the associations therewith, I will not quarrel.

With those who from preference reach for a "high ball" before the bar rather than on the diamond, or with those who prefer the seclusion of a beer tunnel to that of a woodland glen, I am not in touch. I am sitting beside and talking to such of your readers as have in boyhood days known and can recall some companion with whom they have scaled some lofty cliff or by whose side they have wandered along with the purling brook in the meadows below—meadows where the bobolink sang to them long years ago, where the daisies, fleur-de-lis and wild honeysuckle lifted their blossoms in friendly nods—I am in sympathy with those of mature years who, racked with care and worry, have sought the fellowship of some kindred spirit and have roamed among the trees of a hillside or by the sunny shores of some pond or river. As the sick dog seeks darkness, so had my friend and myself sought quiet in nature's solitude many times. They tell me that he had his faults; I have been reminded of my own by interested parties, and yet, while together we never allowed our actions to offend. A man is bad if others say so, and often the judges are spiteful because the victim is not plastic in their hands.

The time required for the germs of typhoid fever to propagate had elapsed since our return, and my friend was tossing upon a bed of fever. The turning point was not in his favor. If I record that I liked him, that I had found in him all the essential characteristics of a gentleman, and that I grieved at my loss, am I sentimental or is there "milk of human kindness?"

As the disease progressed, so did he depart from his former self. With parched tongue, burning skin and racking pains he passed the weary hours. Huge unknown shapes moved down upon him as though to crush him. Again was he dropping from some great height into bottoms that were not reached. One day a few lucid moments were allowed him, as though in pity for his sufferings. He called the nurse to his bedside and requested that his gun be given to me, and with it came a message of regard and hope.

Anon in his delirium he thought us fishing together. He called my name, saying: "You have a bass; strike! Why don't you strike? Ah, you have lost him. We'll pull up and try another place." As the long days and nights passed he became weaker until, worn out and emaciated, he no longer spoke, and the fingers that had so often toyed with the reel were now picking at the blankets. The last spark of life's camp-fire died away and he went out on that long trail called "Death." Silence—oblivion—closed about him for awhile until he emerged higher up and in broad fields, into the presence of that true Guide, of whom it is said, "He maketh me to lie down in green pastures; He leadeth me beside the still waters."

W. W. HASTINGS.

North Carolina Wildfowl Law.

MOREHEAD CITY, N. C., March 14.—*Editor Forest and Stream:* I have put myself to no little trouble and some expense to have our duck laws made so the sporting men of the North could come and kill some of the many ducks that use in our waters during the winter season. I inclose you a copy of the law as it now stands, and hope you give it space in your valuable paper. It has been so for the last eight years that we could not use the battery in our county, but I am glad to say that we can now use it, which is the only means of killing the redhead ducks that use in our waters.

The law relates only to Carteret county, and provides that it shall be unlawful for any person to shoot wildfowl from a battery or sneak-boat on Sundays, Mondays, Wednesdays and Fridays of any week; or to use a battery or sneak-boat before Dec. 1 of any year; or to shoot wildfowl with fire or light between an hour after sunset and before the hour of daylight; or to use any other than a shoulder gun.

E. D. ARTHUR.

Told at the Sportsmen's Show.

[Continued from last week.]

A Man who Sees Bears when he has a Gun.

W. S. "Win" McKenney, of Patten, has the reputation of being a lucky man for running across bears in the woods at times when he has a rifle with him, and pumping them full of lead with a repeating rifle. McKenney generally finds his bears when hunting other game. Last fall a year ago he was on the west branch of the Penobscot and got so close to an old bear and two cubs that he could have touched any one of the three with his rifle barrel. The scene of the incident was in the "beater piece," lying in the angle between the West Branch and Sardnahunk Stream. Most of this triangular section of land has been burnt over in time past, and is grown up to birch. At one side, however, is a belt of black growth, with a springy, moss-carpeted floor that a man can walk over without hearing himself step. McKenney followed the edge of the black growth in the hope of finding a deer or moose feeding on the succulent young growth in the adjoining burnt ground. Before he had gone half a mile he heard an odd noise. He stopped and listened. He could distinguish subdued grunts and whimperings that seemed to come from a point only a few feet away at his elbow, but crane his neck as he would he could see nothing. The hunter knew that the sounds could come from nothing else than an old bear and her cubs, but there was a ventriloquistic quality about the cries that was very puzzling.

"Seemed 's though the bears was close enough to spit on," says McKenney, in telling the story, "but though I worked first this way and then that, and pecked around among the little cat spruces, I couldn't see nothing at all. I just made up my mind there wasn't going to be any more suspense about it, and I took a run and a jump right out into the burnt ground where the sounds came from.

"An old pine-tree stub had fallen over, with its roots sticking up in the air, and as I landed beside that I see the old bear shoot out from under my feet. She just made one bounce and shifted ends in the air and came down facing me. She was so devilish close she didn't dare put, otherwise, I guess she'd run for the black growth.

"I see out of the corners of my eyes a big cub at each of my elbows, facing just the same that their mamma was, and it kind of occurred to me that I might have got too much bear, and I wished I was just about 25 ft. further off, for I couldn't face three ways at once.

"I opened up on the old lady, and gave her a shot through the back of the neck. The blood spurted from both nostrils, but she managed to make one damned good lunge, and my pants was in danger, so I gave her another, and then switched around and begun to operate on the cubs. I fired twice at the first and fetched him, and wounded the second, but that one managed to get to the black growth, and then it was anybody's bear, for I couldn't follow it there. The whole thing was over in about the whisk of a cow's tail, and then I begun to look around to see why I hadn't been able to locate the bears. The reason was plain enough. There was a hole under that fallen stub, and they'd been in there out of sight. That mossy ground in the black growth gave me the chance to get right up on them before they heard me, and then they didn't have time to get away."

Last October McKenney went up on the ridge to the north of Dwelly Pond, which lies among the foothills of Katahdin, in search of moose. Just as he came to an open space 60 or 70 ft. across, from which all the spruce had been cut and hauled away, he heard a grunt, which sounded like the grunt of a young bull moose. McKenney advanced cautiously to the very edge of the opening and peered across. He could hear a rustling of the dry leaves on the ground at the further side, and knew that the game, whatever it might be, was close at hand.

While he stood waiting for something to turn up a shift in the wind or some slight noise which he made alarmed the game. He heard a crash, and the next instant a large bear appeared, running unwittingly directly toward him. McKenney waited till the bear got within ten paces, and then raised his rifle and fired. As luck would have it, the bear saw the hunter the second before he pressed the trigger and made a sudden leap sideways, with the result that he was only slightly wounded by the bullet creasing across his chest. He swung around in the direction he had come, and then McKenney saw that the first bear, which he judged to be an old male, had been followed into the open space by a she bear and two cubs.

"The male bear ran directly back to the others," says McKenney, "and then stopped. They let out a few of those little grunts they was making when I first heard them, and the first thing I knew the old she bear humped herself and started right across the clearing in my direction. I think it was the smell of the blood on the wounded bear that made her savage. She came straight for me, and I figured that the straighter she came the better it suited me. I thought that when she got so far she'd stop and set up, same as they do when they first come out with their cubs. But that setting-up business wasn't in her head for a cent. She came right on, and when she got 20 ft. away she had full steam on still and her ears was laid back and teeth a-showing, and I see that she meant business and no mistake. I hollered, thinking that 'd stop her, but she never let up a particle. And about the time I got that holler finished I tried it again, but it didn't work any better, and then I thought the old gun 'd holler best.

"There was a windfall right in front, not over 8 ft. away, and when the bear got her front feet on that, right up to my nose, I let her have it. The ball struck her fair, and she turned a somersault and landed t'other end to, right at my feet, and before she had time to think about I got another into her and pumped her so full of lead she had to give it up; but she made some awful struggles to get to me, and after it was all over I kind of felt as if I'd been a-monkeying a little too close to the buzz-saw.

"The cubs had gone off somewhere, but all the time I was dressing the she bear the old he fellow that I wounded kept traveling steady around the edge of the clearing. I could hear him snarling, but I couldn't get a sight of him. Bet your boots I was quite a time dressing

her, too. I had to spend so much of my time watching the other one.

"When I got the job done I went down to Dwelly Pond, and there at the big spring I met my brother Frank. Nothing would satisfy Frank but we must go back. We went up on the ridge again, but the old he bear 'd found out he wanted to know, and he'd cleared out. He wasn't quite so crazy for fight as his mate, and perhaps I'm just as well satisfied that he wasn't. By the time I got to skinning the she bear my nerves was acting kind of treacherous, and if the old he fellow 'd been a mind to make a good dash like the first bear he might have had better luck and put my folks to the expense of providing a new suit of clothes to bury me in."

Bear Cubs in Captivity.

In a cage of wire chicken netting near by were two of the tiniest imaginable specimens of black bear cubs. They burrowed down among the leaves with which the bottom of the cage was thickly covered and hugged themselves into little spherical nonentities about the size and shape of croquet balls. Anyone with half an eye could see that they were orphans, and that they were having poor success in their puny efforts to get from the leaves the warmth and comfort they had reason to expect from their shaggy mother bear.

A sign on the cage gave the information that the cubs' names were Tom and Jerry, and that they were eighteen days old on March 8. Bazile furnished some additional facts bearing on their history. "Dey was born between big pine stomp," he said. "A lumbermans throwed a big pine on the other pine stomp, and that made a noise, and the lumbermans heard the old bear make noise on the snow. The lumbermans killed him with his axe." After that the man heard the cubs whining and he enlarged the opening into the den and captured them. At that time their eyes were not open, and they were so small that the man put one in each side pocket of his coat and carried them home that way.

Feeding the Cubs.

Bazile acted as wet nurse for the cubs, and his attentions were not received with favor by Tom and Jerry. Nature had intended them to get their dinners and suppers and little lunches in between in a much easier way than Bazile provided. Consequently, when meal time came there was much squawling.

Bazile took the cubs in turn, lifting them from the cage by the napes of their necks, and afterwards clasping the little balls of black fur around the forward parts of their bodies with one hand, whereupon the cubs would brace their hind feet against the hand and push with such good effect that their unpopular wet nurse was obliged to take them again by the nape of the neck and get a new grip. When at last Bazile had the cub's legs doubled up so that he could in a measure control its contortions, he put the index finger of his free hand in its mouth and held it open, and then dipped the cub head first into a can of milk. For a second or two no sound would be heard. Then there would be a convulsive spluttering, followed by the wildest kind of squalling, as the cub's head was raised to give it air. One of the cubs had a very human cry. Ladies from all parts of the Garden were attracted by the sound. They said the cub said, "Mamma," just like any baby.

When the bears had eaten enough to satisfy their un-sentimental nurse, Bazile wiped their wet little noses with a wad of leaves and put them back in their nest to dream of the warmth and comfort that should by rights have been theirs.

Bear Weights and Growth.

At the present time Tom and Jerry apparently each weigh about 2 lbs. In another place in the Garden is the boxing bear, Pete, in his cage with the bull pup, Doctor. This bear is estimated to weigh a hundred and eighty or two hundred pounds. It was raised in captivity from a cub, and its owner, Sam Castle, of Ottawa, says that it is only eighteen months old. Warren Wing, of Flagstaff, Me., who is a bear trapper of long experience, says that black bear cubs when they first come out of the den with their mother in the spring never weigh more than 5 lbs.

Here are some interesting facts showing the rapid growth of young bears. They emphasize the economy of nature in caring for the mother. No other large wild animal gives birth to offspring in the depth of the winter's cold or under similar conditions. In the den the mother bear gets no food, and her vital functions are necessarily at a low stage of activity. To bring forth large cubs or a large litter would undoubtedly be a tax upon her system greater than she could respond to. She would, moreover, be incapable of supplying nourishment to offspring that made large demands upon her. Consequently she is given the tiniest of progeny. Their wants are so trifling that the mother is capable of supplying them from her reserve of fat, though she partakes of no food whatever herself. The cubs grow very slowly up to the time of leaving the den. As soon as other food is to be found they make up for lost time, and increase in size with surprising rapidity.

Number of Cubs in a Litter.

FOREST AND STREAM recently recorded two instances where four cubs were born to a litter in captivity. In one instance, at least, and no doubt in both, the mother bear did not regularly go into hibernation, and was supplied with food all through the winter. These bears existed under very much more favorable environments than if they had been at large and dependent upon their individual exertions to provide for the coming of their offspring.

Apparently this condition was directly responsible for the large size of the litters.

To find the number of cubs which the mother bear rears in a wild state, a number of representative hunters and woodsmen were interviewed at the Garden. The result is given below.

Nessadero, the Stony Indian from the Rockies, says that he has never seen or heard of more than three cubs with an old bear. He has had a long experience both with grizzlies and black bears.

Fred Lavoie, who has been all over eastern Canada, says that personally he has never seen more than two cubs with one mother bear.

Warren Wing, of Flagstaff, Me., and John Cushman,

whose camps are on Katalhdin Lake, Me., say that three cubs is the largest number of which they have knowledge, and that two cubs with an old she, or even one, is much more common. Mr. Cushman says bears average about the same as deer in the number of young to a birth.

Willie Paulson, from the upper Ottawa, says three cubs is the largest number of which he has knowledge.

E. E. Sumner, Saranac Lake, N. Y., says he has seen three in a litter, but that this number is very unusual.

Wm. E. Cushman, of Sherman, Me., says the average number of cubs is two, but that he has seen three.

W. S. McKenney, of Patten, Me., says he has never seen more than two cubs with the mother bear.

Bazile Maurice says the same thing.

Cary Wright, Salmon, Idaho, says he never saw more than two.

Beebe Sivette, St. Raymond, Que., says the common number of cubs seen with an old bear is one. Occasionally, however, two or three cubs are seen, but never four.

Warren W. Cole, Long Lake, N. Y., has killed an old bear and three cubs at one time.

F. C. Chase, of Newcomb, in the Adirondacks, knows of similar instances, but says two cubs are more frequently met with in company with the mother.

Natey Fogg says a Maine hunter named McPheeters claims to have seen four cubs with the old bear near the head of Nicotous Lake. He captured two of the cubs alive, and said that two others which had been in their company escaped.

Jack Darling also used to tell of following in the snow one winter the tracks of four small bears and one large one. He seemed to think, however, that this old bear might have taken the orphan cubs of some other bear under her protection.

The men whose names are mentioned are all bear hunters of experience, and representative of a large extent of bear country. Not one of them has certain knowledge of four cubs reared by one bear mother at one time, which shows at least that such events are of extreme infrequency.

It is, of course, possible that in many instances more than three cubs at a time may be born to wild bears, and that limited food resources prevent the survival of the entire number. As touching on this point, Mr. Sumner mentions the fact that while on one occasion exploring a she-bear's den that had just been vacated he found the body of a dead cub without scratch or mark to indicate a violent death. Apparently the mother had been unable to supply sufficient nourishment and the cub had died of starvation.

Oddities

Warren W. Cole, of Long Lake, saw a deer killed by Orin Lapelle at Flatfish Lake, Hamilton county, N. Y., that had five legs. The superfluous member started from the gambrel joint of the right hindleg and terminated in a perfect hoof. Mr. Cole tells of a very old and very large bear killed as it was coming out of its den on Vanderwalker Mountain which was estimated to weigh 600lbs. Its cleaned hide weighed 59½lbs., and twelve and a half gallons of oil were tried out from its fat. This bear's nose was full of porcupine quills and it had lost one foot in a trap. It had also been shot years before through the middle of its body. The ball, which was found lying next the skin on the opposite side from that where it entered, was from an old-fashioned muzzle-loading rifle, and the mark of the patch was still in evidence.

Ranson Palmer killed a deer near Long Lake that had carried a bullet in its heart for a considerable period. The wound had healed perfectly and the deer was fat and in fine condition. Dr. Wallace, of Philadelphia, has the heart preserved in alcohol, with the bullet, just as it was found.

E. J. Chase, of Newcomb, N. Y., killed a horned doe near the Adirondack upper works eight or nine years ago. The horns were spikes 6 or 8in. in length. The animal was a young doe and had never bred.

Fayette Moody, Saranac, Lake, killed a horned doe with three prongs on each antler.

E. R. Starbird, Brunswick, Me., has killed two albino deer. He has photographs showing a number of albinos killed at different points in Maine, and it seems that albinos are perhaps more abundant in the Pine Tree State than elsewhere.

Mr. Hall, of Trout Brook Farm, Me., says that old Con Dohaney tells a story of felling an elm tree across Soper Brook one fall from which to dip up water for camp use. The next spring when he returned to the spot he found that beaver had used the log for the basis of a dam spilling down from it after the fashion of lumbermen.

Mr. Samuel L. Crosby exhibits a blue-black trout from Rangeley, taken by a member of the Ogoosoc Angling Association trolling in Mooselumaguntic Lake. The trout is remarkable, says Mr. Crosby, because it is found nowhere else on the continent. The specimen is a slender, handsome fish, weighing 1½lbs.

Moose Shanks

When Willie Paulson wanted a suit of clothes he went out and shot a caribou to get them, and up in Maine every time a hunter kills a moose he gets a pair of shoes. Capt. Edgar E. Harlow, of Moosehead Lake, exhibited a pair of moose shank moccasins which had been stripped from the hind gambrel joints of a moose and partially tanned with soapsuds and salt and alum to prevent the hair coming out. The only sewing required was a few stitches across the narrow part of the shank, which now formed the toe of the moccasins. A strip of skin was run around the top so that the moccasin could be drawn firmly about the ankle of the wearer.

Back in the woods, when a moose is killed all that is necessary to convert the shanks into footgear after they are stripped from the moose are two wooden skewers. The small ends are bent back on themselves and fastened with skewers and there you are. The woodsman throws them in a pail of water at night to keep soft, and doesn't bother to tan them.

Everybody remembers how Davy Crockett met an emergency when there was a demand for ready cash, which he did not possess, by going out and shooting a coon and hypothecating the skin. The expedient of levying on wild nature for the wherewithal to meet pecuniary obligations suggests itself naturally to woodsmen. It is

not every one, however, who has the wit to put the idea to good account. This is the way Natey Fogg drew his check for \$5:

"When Mose and I went up to Sebois Grand Lake to build a hovel for the horses," says Natey, "we expected to stay there all summer and into the hunting season. We took rifles and grub along, but very foolishly forgot about our money and had very little cash between us."

"The mosquitoes and flies were awful bad, and before we got the hovel half finished I made up my mind that I wasn't going to stay there a minute longer than I could help. I needed more than I had with me to get home, for railroad fare and other expenses on the way, and it would have taken no end of time and trouble to go out to Patten and write home for it and wait till it came, so I made up my mind the money had to be forthcoming right where we were. There were some old bear traps in the camp, and I took one of them and caught a string of pickerel and set the trap in that burned land near the head of White Horse Lake, in a likely looking place for bear, and went back to work on the hovel."

"That next week the mosquitoes were worse than ever. Mose said the only way to get the better of them was to sleep with an iron kettle over your head and a hammer in your hand, so that when a mosquito drove his bill through the kettle you could rivet it in the inside with the hammer and hold him there. I tried to rout them out by making a fire in a tin pail and raising a smoke. I went to sleep one night with the pail over my head. After a while I woke up with the side of my face kind of warm and found that the pail had set fire to the bedding, and burnt up half of my pillow and the corner of the mattress and part of my blankets, and was eating through the floor."

"Well, as I was saying, the mosquitoes was mighty bad, and I wanted to get out. I hadn't much faith in that bear trap, but as soon as the hovel was finished I went down to look at it, and when I got there the trap was gone. I followed up the trail, and after a while I found the bear in a place where the trees grew just about as thick as the hairs on a dog. He had wound the chain around two little firs and that held him; but to get a good sight on him I had to walk up within less than 15ft. His hide wasn't any good, but there was \$5 bounty on it, and I'd rather be chewed by a bear any day than eaten alive by mosquitoes, so I got right down into that hole, and when I got my chance I fired and killed the bear. The next morning I took the hide in my canoe and went out to Patten and collected the bounty, and then I made tracks for home."

J. B. BURNHAM.

The Yellowstone Park Game.

YELLOWSTONE PARK, March 13.—*Editor Forest and Stream:* I'm home once more. I find a hard winter here—hard in every respect. I see lots of game everywhere I have been since my return to the Park, and much of it is looking very thin, and the conditions are such that there will be considerable loss. One of the good things that has happened here is the killing of seven mountain lions, while down the river a few miles and close to the Park boundary three others were killed. These animals are the worst poachers we have in the Park. They are very destructive to sheep and deer, for deer, being smaller than elk, it takes so many more to feed them.

I came up here the other afternoon on the mail sled, putting in my time locating and counting the bands of deer and other game along the road. I saw five bands of mule deer close to the road, counting five, sixteen, twenty-four, fifteen and twenty-eight. There were old ones, too, here and there between the bands and bunches of three and lone whitetails. I did not see any sheep while coming up, but before we left Gardiner I was looking at them with a glass on the bench back of the Eagle's Nest and cliffs, and McMinn bench. I saw hundreds of elk before starting up, but only a few in sight of the road after we entered the cañon. The day was rather bright and warm for game to be out very much in sight, still I counted several small bands along the side of Mt. Everts, one of thirty-four. Antelope I saw before starting, but not one from the road. Still, I saw several trails where they had crossed both the road and Gardiner River. Unfortunately, I saw many coyote tracks, and lately I have heard their very disagreeable howl. They are back here in considerable numbers, but not as bad as two years ago. I saw less bird life along the river, but there is yet quite a number of ducks.

One always sees fish in the Gardiner when the water and day are clear. I saw a few, but could not tell what kind of trout they were. Lately those who catch fish here get three kinds of trout—native trout, brook trout (of the East) and Loch Leven, the two last from plants made by the United States Fish Commission on the upper waters. I saw several Loch Leven of 1½lbs. each. This is very interesting fishing, as one is wading through warm water one moment, and the next is on the banks in 1 to 2ft. of snow. Often the line is frozen in a moment while out of the water.

Reaching the Springs and Ft. Yellowstone, I saw in the inclosure for game the five bulls I captured while young and two wild cows. I learned from Capt. James B. Erwin that they were taken from an old corral or pen where he has two whitetail deer. The captain proposes to add all kinds of park animals to his collection for the benefit of the visitors, who, traveling wagon roads, as they do, see so little of the great amount of animal life in the Park. This collection will give them a near view. The Captain says his scouts and men at stations have reported in all fifty buffalo, twelve of these being calves. I won't say where they are, except this: They are in the Park, and it would not be healthy for any one to attempt to get one. They are to be left undisturbed by everybody.

Several important changes have been made since I left here last fall. One, granting the transportation company the right to build permanent camps, like the Wylie Camping Company's; another, the rumored sale of the hotels to Dr. Seward Webb and associates. An order from the Interior Department greatly restricts the number of licenses to be granted to private teams, and in no case will more than one license be granted to one man, and that for one wagon only; also requiring the holder to accom-

pany his wagon during the trip. Another order permits these licensed teams to carry their parties to the hotels if they wish or camp where before they were compelled to camp.

Capt. Erwin's scouts and men stationed at Soda Butte report the elk in the East Fork country very thin and weak. They say that they have to make some of them get out of the road or else must run into them on their snowshoes. There are thousands of elk in the northern section of the Park, and unless we have an early spring there will be a great loss later. I am sure of this by the way range horses are starving. There is deeper snow lying on a level along the foothills and in the Yellowstone Valley than for many years. It is a harder winter in this section than the winter of '86 and '87, when there was such a great loss of stock. At this date the snow at the altitude of Gardiner and Cinnabar is almost a sheet of ice.

A good many coyotes are killed. They are shot on sight. Some wolves are said to have been killed in the northern part of the Park; one man claims that he got six wolves and four coyotes near Yancey's. There is no mail route now through the Park to Cooke City. One must snowshoe it to get there or to Soda Butte or "Uncle John's" if they wish to see game. Standing in the streets of Gardiner one day and looking into the Park, I saw bands of elk in hundreds and bands of antelope, in all about 150, sixteen mountain sheep and a few black and whitetail deer. Had I taken time and looked carefully I could have seen coyotes, but I did not want to see them.

E. HOFER.

Natural History.

Notes on Park Moose.

FROM November, 1896, to the time of their death in December, 1897, a pair of New Brunswick moose were an attraction and subjects of much interest at our Roger Williams Park, in Providence, R. I.

The development of antlers of the male seemed a matter of some interest, and with the assistance of the park officials and friends with their cameras, I have secured some photographs showing the size and form of these antlers at certain dates. It is impossible to give the exact date at which this growth started. Through the winter the pedicles on which the antlers grew were bare and prominent spots. At length these show an increased prominence, begin to lengthen, the velvet appears on them and the new antlers are in process of growth. This change began to occur in the latter part of March, and by May 8 the new growths were 7 or 8in. long. At this time the beams were straight round, and the full diameter they were to attain. Then there was a broadening and flattening at the end of each beam, followed by a division, and May 23 a length of 12in. had been attained, and the appearance shown in the photograph taken that day. The next photograph was secured June 13. The antlers were then about 15in. long, with a spread of the tines on each of 14in.

From this time to the latter part of July the growth was rapid, and when our third picture was taken, Aug. 1, the antlers were complete and perfect, except as to the ends of the points. There were eight points on one side and seven on the other.

When these moose were brought here the bull was said to be six years old. His antlers had a spread of 47in. with eighteen points. Those shown by our photographs also had a spread of 47in., but the points had decreased as above stated, and the weight was also much less. Those who were interested hoped for an improved set, but evidently impaired vitality prevented a vigorous growth.

As the antlers increased in size the bell also increased until 13 or 14in. long, and after the antlers were dropped. Dec. 1 the bell decreased in length.

May 19 the cow gave birth to a female calf. The calf weighed about 30lbs., and was a light bay color. This gradually changed, the ends of the hairs first, to a brown like the parents. We secured a very good portrait of this young moose when twenty-four days old. For the purpose of taking these pictures we went several times into the paddock with the moose without their showing any ugly disposition, but in the fall the bull became dangerous. These animals were confined in an enclosure about 15ft. square, containing a grove of trees, but no bushes. For the want of bushes to rub, or from some other cause, our moose never entirely cleared the velvet from his antlers, nor did they attain the dark color natural to the antlers of the wild moose.

The evening of Oct. 1, 1897, having just returned from a moose calling trip to New Brunswick, I went to our park to try the effect of an imitation of the defiant note of the bull moose, as I had heard it in the wilds of the Mirimachi country. The family of moose were lying together in the grove of trees in their paddock, 50ft. or so from the fence; bright about us shone the electric lights, and nearby the passing of steam and electric cars gave sounds not usually associated with moose calling. At the first sound of the horn, the bull sprang to his feet, giving his answer and starting toward me, and the cow answered with a long call. I thought also the calf answered, but of this in the excitement and noise I could not be sure. At the second sound of the note, the bull answered again, and without an instant's hesitation charged against the fence in the greatest fury. As he came on his head was lowered, bringing his antlers about on a line with his shoulders.

At other times, both day and evening, I tried to deceive him, but without success. The cow would repeatedly answer, always with a short call, quite different from the long call imitated to call the moose of the wild woods. A number of different notes, this cow used, usually in a tone that could be heard only a short distance.

The life of these interesting animals here was short. The older moose both died in December, 1897, having lived here about a year, and the calf died in the spring of 1898. The conditions under which they were kept were not favorable. They had no access to any body of water, and evidently suffered in the summer heat, nor had they sufficient room for exercise.

FRED TALCOTT.

PROVIDENCE, R. I., Feb. 14.

Instinct.

Editor Forest and Stream:

Mr. Fred Mather, in his paper, "Reason and Instinct," intimates that he expects the other fellow to whack him. In this case I am the other fellow, and I am going to whack some of the instinct out of his argument if I can express my ideas in words.

The ideas conveyed by the word instinct, had their origin when ignorance and superstition swayed the mind of man. When it was the belief that there was an impassable gulf between man and brute. When all mystery in animate nature was explained by the term instinct. All this is changed. True, it may not be known to the casual reader, but it is a fact that scientific investigation has swept away the last vestiges of these old delusions.

Science teaches us that the tissue that renders mental faculties possible is not confined to man, but is shared by other animal life. Mr. Mather's observations of the lower animals has led to this conclusion, hence he grants reason to the brute creation, thus far overthrowing instinct. But he does not go far enough. He yet holds to the word instinct to explain a seeming mystery. His statement that instinct closes the eye of man to protect it, is one of the old delusions that science has exposed and annihilated.

Forty-four years ago, when I was about sixteen years of age, and was attending Hampden Academy, Me., I heard the Professor in a lecture make the same statement. It was a puzzle for me. I could not grasp the idea. What is instinct? Where is it located? How does it get control of the muscles of the eyelid? These were questions I asked myself in vain. In my study of mind and matter, it was a mountain in the pathway, and at last I asked the professor to explain. My thirst for knowledge received a setback, when he smilingly

JUNE 13.

Why does science claim that there is a consciousness that protects and controls the animal organism? Science claims it because the existence of the organism is absolutely dependent on some such power. All the facts point in one direction. The mechanism is perfect and its action proves the theory. All the organs necessary

with Mr. Mather, while fighting the battle for the lower animals. I shall use my knowledge of animal life to show how unjust are the arguments advanced by the opposition. If words do not fail me, I believe I can prove that the line of reasoning deduced from hypothetical idiotic actions of the lower animals is unjust and will not stand the test of common sense.

HERMIT.

Editor Forest and Stream:

Mr. Wade's so-called argument is so incoherently weak that it falls of its own defects.

The attainment of particular ends by the combination of materials and labor is the result of education, not of reason alone. I will gamble that if brother Wade wore out a hunting shirt he could no more replace it by making one himself—though surrounded by materials and machinery—than the dog could build the fire, and he might "hover around" a plate of pate de foies gras till the same was exhausted and he could not produce another dish if the streets swarmed with geese—he confounds reason with education. His allegations in regard to the calf and the pups is without weight, as there is no means of proving that the mother is deceived. I have known of a cat suckling a rabbit, but was never of the opinion that the cat was fooled any. I believe the mother instinct to exist to greater or less extent in all animals.

When a dog hovers around an "expiring fire" or any other kind of a fire, he "deduces inferences from the premises"; being cold, he reasons that the fire will warm him, and governs himself accordingly.

Out of his own mouth shall he be judged. He says "I never saw an intelligent act in one of my dogs that was not readily accounted for by its previous acts and experiences." Just so; they "deduced inferences from the premises," i. e., their experiences. This very abil-

AUGUST 1.

said: "Master Walton, I frankly admit that I don't know anything about it."

I think if Mr. Mather were hard pressed he would have to make the same reply.

Now, in the light of science, let us see what takes place when an eye is threatened: The dangerous object is focused on the retina, thus brought in contact with the optic nerve. The optic nerve conveys the image to the area in the brain, where the knowledge of sight exists. Consciousness takes alarm and calls upon the proper muscles to close the eyelid. How do we know this? We know it because consciousness must be properly alarmed. If the mechanism of the eye is imperfect, protection will not take place. If the optic nerve were severed, the eye would be sightless, for the reason that there would be no connection with the area in the brain, where the knowledge of sight exists. Under such circumstances consciousness could not be alarmed by the sense of sight. But science teaches us that consciousness may also take alarm through the sense of feeling, even if the eye were sightless.

Removing the foot from a burning coal is not dependent on instinct, as Mr. Mather seems to think. It is wholly unthinkable that instinct can control the proper muscles to remove the foot. Here pain conveys the alarm. The nerves connect the burning flesh with the spot in the brain, where the knowledge of pain exists, and consciousness does the rest. If the nerves were severed, no pain would result, and no alarm and protection take place. The sight or smell of burning flesh could carry the alarm to the brain, and consciousness would afford protection just as in the case of pain.

The inability to feel pain when the nerves fail to connect with the brain is often emphasized when we lie on an arm in the night. I awoke one night not long ago and found that in some way I had stopped the nerves of my left arm from communicating with the brain. For a short time my hand was completely paralyzed. It did not feel natural to the touch of the other hand. There was no reciprocity of feeling. I sharply pinched the fingers without producing pain. A live coal would have had no power to insure protection by the burning of the hand, because the brain being disconnected, there could be no sensation of pain. Pain is a necessary provision of nature to protect the flesh of animal life. If there were no pain animals would be careless, and doubtless their bones and muscles would become exposed through ragged wounds.

to prove the theory of consciousness are provided, including nerve, muscle and gray tissue. This holds good in relation to the lower animals as well as to man.

I do not want it inferred from what I have written of consciousness that I indorse that old definition: "Man is an intelligence served by organs."

Man is an organism, the whole dependent on the

MOOSE CALF.

Williams Park, Providence, R. I.

parts. The service is reciprocal. Man, with all his boasted intelligence, may be sent to the mad-house by a slight change in his nerve tissue.

I hope Mr. Mather, when he writes for FOREST AND STREAM, will kindly substitute the word heredity for instinct. It is a much better word, and it expresses all that the word instinct can without partaking of the supernatural.

In my next paper I shall stand shoulder to shoulder

ity to profit by experience or the results of previous acts is the strongest possible proof of reason. Shelter cannot be had in the claim that this is memory, for memory unassisted by reason would but record the result in a specific case; it could not connect that result with the probable result of future acts. Man at birth is as feeble and helpless as is the dog, and the development of his ability to reason is based upon his experiences and the experiences of others. The child may once grasp the hot iron, but he seldom does it twice. The pup may once put his nose on the hot radiator, but he refrains thereafter. The child and the dog "deduce inferences from the premises." Is there any possible warrant for the claim that one travels the road of reason and the other than of instinct? As I said before, our friend Wade confuses reason and education.

No one will for a moment contend that the possibilities of education in the dog are equal to those in most men, but the fact that they are circumscribed does not confute their existence any more than would the fact that one man's mental grasp is greater than another's prove the absence of mind in the weaker.

I am well aware that in some of our modern dictionaries reason is given as an attribute of man only, as distinguished from the intelligence of the brute creation, but in the definition given by Mr. Wade, and the generally accepted use of the term, the position of the ant is untenable.

COUNSELOR.

The Flight of an Eagle.

SPRINGFIELD, Ill., March 5.—*Editor Forest and Stream:* My friend, Charles C. Sedgwick, the well-known sportsman of Dansville, N. Y., who, by the way, is always on the lookout for something interesting in the doings of wild creatures, writes under a recent date that some weeks ago, while absorbed in some work in the house, his attention was attracted to a passing pedestrian looking intently at the sky. Throwing open the window he beheld a large eagle come sailing up the street. To quote his own words: "The air was heavy after some rain. I ran down stairs just as the great bird passed over our house. He was flying quite low, and had to flop heavily to get on. He passed over the Rhoda farm and then turned to the southwest. It was a grand sight. He looked to spread 6 or 7 ft. At first I thought he had been wounded, but later made up my mind that he was all right."

J. M. S.

Sheldrakes.

COL MATHER, in his article on "Domesticating Wild fowl," under the section, "The Hollow Tree Nesters," says: "If the other mergansers or sheldrakes nest in trees I do not know, but I suspect them of it."

His suspicions are correct in regard to the American merganser (*M. americanus*). These birds nest in hollows in trees. I have seen twelve eggs taken from a nest which was in a hole in a green maple overhanging the water. They sometimes nest quite a distance back from the water. A friend in whose word I place implicit confidence told me that once when lunching with some river drivers under the shelving bank of an island in Penobscot River, a sheldrake passed directly over their heads and just skimmed the water as she struck, and spilled off some four or five young which she was conveying from the nest to the water. Although I have never personally seen this done, I have no doubt that they take their young to the water in this way.

On the contrary, the red-breasted merganser (*M. serrator*), as far as my observation goes, always nest on ledges. In many lakes in the northern part of Maine their nests can be found on low, ledgy islands every year. I have once found sixteen eggs in one nest. The nest is usually placed under some low, spreading bank. I have found their nests and those of herring gull, tern and sandpipers all on one small ledge. If their eggs are taken they will lay a second time, and I have good reason to believe even a third time. I have one mounted which is in the down, which I took Aug. 26, 1888, at Cancom-gammock Lake. There were six in the brood to which this belonged, and I saw another brood of four only a few days old. On speaking of this to a hunter of my acquaintance, and expressing surprise at birds being in the down so late, he said: "Oh! I can tell you all about that. I was hunting bear up there, and I robbed all the nests there twice to get the eggs to eat, and the broods you saw were a third brood from eggs laid after I left." As the ice begins to form there the last of September, it seems hardly possible that these birds could get so as to fly before it froze.

There is a story of one of our guides eating seventeen sheldrake's eggs at one meal and then remarking, "that he never liked sheldrake's eggs, as they tasted fishy." I have eaten them, and never could detect any fishy taste; but perhaps I did not eat enough to get the true flavor.

While the males of these two sheldrakes differ widely, the females resemble each other so much that one must have the bird in their hand and then look very closely to tell them apart. I have never known the males of either kind to be found near the nests. M. HARDY.

A Trip to Beaver Land.

IN reading a recent issue of FOREST AND STREAM I was surprised to learn that a beaver had recently been captured in New York State. It then occurred to me that the description of a trip to the present home of the beaver might be of interest to your many readers. We were a merry party as we started from Winnipeg, Manitoba, one bright morning in early summer; and an undignified crowd, in spite of our high-sounding title of "Natural History Picnic Club." Taking the train north to Selkirk, we there went on board Lake Winnipeg's finest steamer, the Lady of the Lake. After a two days' voyage full of soft, balmy air and varied and picturesque scenery, we reached Norway House, at the northern end of the lake. This was to be the headquarters of our season's operations.

Norway House is one of the oldest of the old Hudson Bay Company's posts, and was for many years the great distributing point for the whole Northwest. It has lost much of its ancient glory, but is still an important trading post.

We were most kindly received by the chief factor, who offered to give us any assistance in his power, and soon provided us with a reliable Indian guide. During the day we wandered about, and were much interested by the shrewd observations of an old trapper who was engaged in making caviar. This delicious article is made from the spawn of the sturgeon that are caught about this time. There are two varieties, but the black spawn is much the more valuable of the two. By some process, known only to the chosen few, this substance is treated with German salt and packed in barrels. It is finally packed in small boxes and sold on the market at enormous prices.

Early on the following morning we were up, and off down the Nelson in our stout canoes. We had to portage in several places, but luckily we met with no accident. Darkness was just coming on when we reached Cross Lake Post, sixty miles from Norway House. That night we enjoyed the sleep that comes to those who travel all day by canoe or dog-train.

Next day we were up with the sun, and after a hasty meal set out for a beaver colony, which the guide said was not far from here. We went back some distance from the usual course of travel. This northern country is completely covered with a network of lakes and rivers, and with a canoe it is possible to travel anywhere.

At length we reached a little lake, on whose shores we landed. Quite near us was a small clearing, and toward this we now quietly advanced. The appearance of this open space would lead one to suppose that a gang of woodchoppers had recently been engaged here. Creeping quietly forward, we caught sight of the rising village. Some of the houses were finished, while others were nearly so. As no dam was required, this colony apparently took life easy. A few were leisurely building with poplar sticks and mud, but the majority appeared to be taking a holiday.

The houses are dome-shaped in structure, and must have served as models for the huts of the Eskimo further north.

But most interesting of all were the beavers themselves, ranging in size from the 10lb. kitten to the full-grown adult, which would probably weigh 50lbs. or more.

This visit to a beaver village shattered, alas, some of my longest-cherished convictions. I had always been told that the beaver is never idle. Now, I am certain I saw a half-dozen at least who must have been shirking most shamefully. Worse still, not a single beaver used

his tail as a trowel in building all the time I was there. I found it hard, indeed, to give up this last conviction.

The tail of the beaver is about 1ft long and is well adapted to its use, as a rudder. The feet are well worth notice, the front ones being small and flexible and the hind ones closely webbed.

The incisors are important to the beaver, for it is with these that he cuts the material for his food, his hut and the dam, if there be one.

His food in winter consist of the bark of the birch, poplar or willow, which he has stored up during the summer and autumn months. In summer he feasts on the young shoots and the juicy root-stalks of the many water plants that surround his home.

Altogether he is a social and contented little animal, which has furnished the Hudson Bay Company with thousands of dollars, moralists with many valuable illustrations, and Canada itself with a national emblem.

Random Notes.

Wild Pigeon Flights Then and Now.

ALONG about the years 1860 to 1870 wild pigeons were numerous in eastern Indiana and western Ohio. They had a roost near the source of the Wabash River south of Fort Recovery, and they came to it by the thousands from the Northwest. Our farm seemed to be in the line of flight, and the coming and going of wild pigeons was as regular and eventful an incident as the coming of Christmas. Stray flocks settled in our own and neighboring fields, and I trapped a few where scattered corn had been left in the field. We frequently shot at them as they flew overhead, but we had nothing better than an old smooth-bore gun that would not shoot beyond the tree tops, and the flight was out of reach. I believe I killed only one with a gun, until I began shooting a rifle. Then I frequently shot their heads off while they were among the branches of pin oak trees feeding. Men who visited the roost reported that pigeons were so numerous their combined weight broke many branches from the trees. After night hunters thrashed them off the lower branches with long poles, and carried them home by the sack full. I can't recall the time nor place at which I killed my last pigeon. I never considered them a desirable article for food; not much better than a yellow-hammer.

Last August as I was driving north out of town, a flock of about forty birds flew over, going northeast. They were about the right height, and their shape, size, movement, speed and line formation all tallied with the wild pigeon of my boyhood days. I watched them until the line faded away in the distant blue of the horizon's rim, trying to convince myself that they were turtle doves, but all the evidence tended to show that they were wild pigeons. Did any other reader of FOREST AND STREAM see them?

The Dove.

What sportsman has the hardness of heart to kill a dove? I never killed one, and if I did I would be ashamed to tell it. I was under the impression until recent years that doves were looked upon as being almost sacred, a bird blessed by Divine Providence, and I still think that no true sportsman will be guilty of their destruction, and further that they should be protected by law at all times and in all places.

Quail, Corn and Wheat.

From childhood I have known that quail would pull up corn. Like the crow, they take hold of the young shoot when it is an inch or so above ground, pull it up by the root, so to speak, and then eat the grain that adheres to the roots. I frequently replanted where they had taken hill after hill. A few years ago I was in the country and had a Flobert rifle with me. I drove near a Bob White sitting on the fence near a shock of wheat. I violated the law for scientific reasons. When I examined his crop I found forty-one large plump grains of wheat and not a thing else. There were bugs in the stubble, no doubt, but the quail preferred wheat. Nevertheless if I lived on a farm I would protect my quail. When I was a boy we captured game in any manner possible. I shot eleven quail at one shot with the smooth-bore mentioned above. Later I killed four quail at one shot with a muzzle-loading rifle.

Speaking of Shots.

In October, 1893, I shot a small deer in a slashing near the Michigamme River in Upper Peninsula, Michigan, knocking it down in its tracks. It was partly concealed by the weeds and briars, and lay there while I watched a large doe in her wild flight up a crooked ravine. When the doe was out of sight I started down to the one I had shot, and was within about sixty steps of it when it jumped up and started off at a lively clip, but wabbling in a way that showed it had been hit hard. I pulled up my rifle and cut loose at its shoulder, and it dropped as if shot through the brain. When I went up to it, it was dead, but there was only one bullet mark on it, and that was a hole through both shoulders.

In October, 1895, in the same slashing, I walked up a tree trunk that had lodged until I came to a tree against which the leaning one rested some 20ft. from the ground. I stood there probably about thirty minutes with my back against the upright tree, when I heard a rustling among the leafy branches of a fallen sugar to my left. Presently a small deer crept out from among the branches and stood broadside not more than 40yds. distant. I carried that deer to camp. The point to this is that I walked logs 100yds. or more, then the leaning tree to within an easy shot without noise.

Last November, while sitting on a pine stump on the south point of a ridge about four miles west of the place mentioned above I was much interested in the movements of a hunter who seemed to be trying hard to locate something. He circled my perch, coming from the northwest, passing around south and disappearing northeast of me. He came within fifteen steps of me, but did not look toward the hill. A half-hour later as I was going north, he crossed my path going west with his eyes riveted to the ground, and a few moments later as I was trying to locate the whistle of a buck in the distance, the old

gentleman came plump on to me from the west. He was carrying a handsome Winchester shotgun, and explained that a couple of hours before he had put a charge of nine buckshot into the shoulder of a large buck at close range, but the buck got away and he could not trail him. He said he lived on the Michigan Lower Peninsula, and was camped back on Fence River. He seemed very much worried over his misfortune, and I felt sorry, for I concluded it was one of those rare occasions when an old hunter lost an opportunity to score another big buck, and thus fittingly round out a successful hunter's career.

G. W. CUNNINGHAM.

That Alaskan Warm Lake.

WASHINGTON, D. C., March 16.—*Editor Forest and Stream*: I note in your issue of March 18 an article from the Catholic Columbian, describing a warm water lake named Selawik in the vicinity of Dawson, the waters of which are said to rise and fall with the tides on the shores of Alaska, and stating that "the improvident gold seeker * * * has only to borrow a sled and a couple of dogs to go over to Selawik, where, in a couple of hours, he can kill with a boat hook more salmon than he can eat in a fortnight."

I have spent two and a half years in the interior of Alaska, and have been nine times across the entire territory from east to west, and while I am not in a position to absolutely deny the above statement, I must say that it is most improbable. If it were made by any other than one so well known in connection with missionary work in Alaska as Father Tosi, I should consider it as intended for a bit of humor to beguile the artless "chee-charcô."

I have visited Dawson on many occasions from the spring of 1897 when there were only two or three cabins to late in August when the camp had become a populous city, and spent an entire winter in the vicinity, making trips of from 25 to 40 miles east of the Yukon, and from 25 to 130 miles to the west, and up to that time the existence of such a lake was unknown to the miners. The Yukon River is certainly the lowest known spot in the vicinity of Dawson, and it is an even 1,000ft. above sea level.

Anyone who has tried fishing for salmon in the upper Yukon with the largest nets knows that it is not a profitable industry, so it would seem rather difficult to believe that such marvelous catches could be made in Lake Selawik with a boat hook.

The reverend father has doubtless credited the reports of some imaginative fortune seeker, or the alleged hot spring near Medicine Lake, southwest of Circle City, may have furnished the groundwork for the story.

How these humans do reason about whether the other animals do reason or do not reason. Wonder if the other animals reason about whether these humans do reason or do not reason.

II.

Americans take the time for their pleasures from the hours of sleep instead of the hours of business. So they make an added burden of what should be not only a pleasure, but also a recreation. J. B. DAVIS.

MICHIGAN.

Some Features of the Show.

Editor Forest and Stream:

Merely as a matter of information, will somebody connected with the Adirondack exhibits at the Sportsmen's Exposition please tell where the man dressed in yellow buckskin, with fringes, got his suit of clothes? Additional particulars would be interesting, too. Did the man ever see buckskin clothes previous to his coming to New York; and if he did, was it at a circus? Was the suit a rented one? What was the object of having him dressed up in that style? Was it a sort of jack-lantern to dazzle the innocent crowds, so that they would fall ready and easy victims? Or may be he didn't belong with that exhibit.

Also, was that spotted fawn with a doe a type or indication of anything in particular? There were several spotted fawns on exhibition—lank little creatures, very interesting to contemplate. Where did they come from? What gallant sportsman procured them? Did hounds, "with mellow voices and eager leapings," pursue them to "the death"? Were the fawns there as specimens of the game a sportsman might expect to get while fishing with a 10-gauge shotgun in July?

RAYMOND S. SPEARS.

NEW YORK.

A Fortunate Fluke.

An extraordinary shooting adventure, which has the advantage of being easy of belief, is recorded by A. L. Butler, of the State Museum, Selangor, Malaya, in the last number of the Bombay Natural History Society's journal. One day in last July a Malay woodcutter went out into the jungle to cut fuel, taking with him, on the off-chance of a shot at a deer, an old single-barreled muzzle-loading gun, loaded with the rather unscientific charge of a bullet and four buckshot. Moving quietly through the jungle, he suddenly came upon a tiger feeding on the carcass of a sambhur, and, with touching confidence in his weapon, fired at a distance of twenty paces. The tiger rolled over, and, when the Malay cautiously approached, he found not one dead tiger, but two, the second having been hidden from the sportsman, though only a few feet distant from the animal he fired at. Mr. Butler, who made the post-mortem examination of the tigers, after they had been skinned, found that in each case a single buckshot had gone to the heart; one had also an insignificant wound on the head from another pellet. "For a really appalling fluke," as Mr. Butler says, this achievement of the Malay woodcutter will be hard to beat. It is certainly not a performance any sane white man will try to parallel, much less to eclipse.—London Sketch.

Game Bag and Gun.

A Mowitch Hunt in Southeastern Alaska.

ALL last summer, while occupied at Ketchikan, Alaska, we had promised for ourselves during the coming fall a series of hunting trips after deer, goat and bear; and one of these trips—an excursion to the Prince of Wales Island—after "mowiches," as the Indians or Siwash call the deer of this section, is the foundation for this article.

With the exception of Bill, a Montana man, the party consisted of Bostonians, six in all, and an especially congenial company it proved to be. None were tenderfeet, a few were old rustlers, and the senior member, a campaigner of years standing, whom we all called the Major, proved the very life of the outfit. His dry wit and seemingly endless fund of stories, together with his sunny good nature under the most trying circumstances, soon won for him the affections of the entire "push."

Ketchikan was left late in September, in the four-ton sloop yacht Skookum, Capt. Pete McKinnion, with two sealing boats in tow. These were to be used after reaching the island, as we had only hired the Skookum to insure the safe passage of Clarence Straits, a nasty bit of water some twelve miles in width, facing the stormy Pacific, and which seems to really welcome the southerly gales that come piling in with such ferocity that one can well imagine them as coming all the way from China across the pond.

Although only a distance of thirty-five miles to our destination, it had been agreed to make it in two runs, the first a leg of some fifteen miles, to the Dall Head copper properties, on the southern extremity of Gravina Island, where chef Hunt, whose cooking is noted from Wrangel to Portland, Oregon, kept open house in Hotel de Siwash, and where our former visits had always been hailed as occasions of feasting and song. The day in question was no exception, and we were welcomed royally. Twenty-four hours were lost here on account of storm, but much to our satisfaction, and on the third day, we took leave of our hospitable friend, promising to bring him a pair of mowiche saddles on our return.

It was a clear and aggravatingly calm morning, as, laboring with the long sweep oars, the sloop moved slowly out of the bay; but after rounding the head a fair wind sprang up, and for the rest of the three hours' sail we lay back and talked of our prospective hunt, or listened to the croonings of the Major and Bill, both of whom had soon discovered that peculiar affinity existing between men who have been in the same camps in the different mining sections of the West, and who have known the same men, but not each other. The day proved delightful, and the blue of the mountains gradually dissolved itself into harmonious grays and greens, as approaching the island, Point Adams could be seen, as well as Morris Bay, for which we were heading; but the breeze left us when well within the bay, and another wrestle with the sweeps was necessary to carry us up the long narrow reach of water forming North Arm, at the head of which was the Indian Nowiski's salmon chuck and shack, where we were to make our headquarters.

A Siwash "salmon chuck" is the stream allotted him by his tribe, and on which he has the sole right to fish, with power to forcibly prevent trespassing. This latter right only applies to the Indians, white men going where they chose. It interested those of us who were ignorant on the subject, to learn, that, unlike our Eastern salmon, the fish here, after running up the streams and depositing their spawn, never return to the salt water, but their mission in life being fulfilled, die an ignominious death—the bodies lodged along the banks giving sustenance to hundreds of ravens and eagles, as well as many smaller birds. All the geese killed by the outfit were found to be full of salmon spawn, the meat proving too fishy to be at all palatable.

Big Pete left for Ketchikan the morning following our arrival with instructions to return again in ten days, there being provisions sufficient merely for that time. The days passed only too rapidly, and, although most of us hunted continually and conscientiously, no deer were killed, and but three seen—one swimming so far out in Mineral Lake, at the head of the chuck, as to be out of range, while the other two, a buck and a doe, were fired upon by Dick, who scored a clean miss on two as pretty broadside shots as could be desired. He laid this to overconfidence.

Although the deer here are black-tailed, all right enough, there is a vast difference between them and the same kind of deer throughout our Western States. They are much smaller for one thing, smaller even than the white-tail, of Maine, though resembling the latter animal in color. I have never seen that beautiful squirrel-gray coat one finds on Montana and Colorado blacktail. The antlers too, only in occasional instances have a double prong, branching from the main beam, the majority of horns being formed precisely as a whitetail.

We at first attributed our non-success to the limited knowledge of the habitat of these particular deer, but later it was found that there had been an unusually heavy killing in this same neighborhood the winter before by both Indians and wolves—a single Siwash having killed unaided and in a single day over 100 of these poor emaciated creatures, simply for their hides—the market value being a little less than 12 cents. This may sound a trifle "fishy," and it did to me at first until I heard how it was accomplished.

To understand the situation, it is necessary to state that from about Christmas time until early in March the snows are very deep, varying from 4 to 6 ft. This of course drives all deer on both mainland and islands to the seashore, where at night they bed down within 50 yds. of the water. During the daytime they may be seen in great numbers along the beaches feeding on "kelp," a kind of seaweed left unfrozen by the retreating tides. Three or four weeks on this diet will so weaken them that they fall a ready prey to both wolves and hide hunters. The former is a large timber wolf, black

as a bear and standing nearly as high as a mastiff dog. They are crafty and savage, but cowardly when not banded together, and would have to be exceptionally hungry to attack a human being even then.

A man named Gullet and I spent three weeks in November north of Ketchikan, in a country where they are plentiful, endeavoring to trap one of these black fellows, but we failed to even get sight of one.

It was an easy matter therefore for this Indian to come to North Arm in January, where there had been no previous hunting, and leaving his Klootchmen (squaws) armed with skinning knives to follow on the shore, he in a canoe could paddle leisurely along, and if a good shot not lose a hoof while ammunition lasted. Up to the time of the sloop's expected arrival the weather had been remarkably fine, such days when clear as one finds only in Alaska.

However, on Oct. 8 a series of westerly and southerly storms broke upon us in such fury that it was understood we must give up all hopes of Big Pete's coming. This sort of weather continued for several days, and in the meantime the provisions were getting seriously low. Cream, sugar and butter were of the past, as well as numerous little things which we had brought along to give variety to our bill of fare. Flour we had in plenty, but coffee and potatoes were on the "reduced ration list." On the 15th Dick and the writer returned to camp, after having seen a large black bear without even the chance of a shot, and the climax of our disgust was reached to find the cigarette tobacco entirely gone and the pipe tobacco nearly so.

Then it was decided that something must be done, and that immediately. During the discussion one of the fellows attempted an impossible cigarette with plug tobacco and soap wrapper, which was unanimously voted "out" by the rest of us. After talking it over, Bill and I declared our intention of taking one of the sealing boats, and on the first calm day of rowing over

AN ALASKAN DEER.

to Hunt's, and, procuring the big schooner laying at anchor there, we could return for the rest, regardless of weather.

Two days later found us pulling down the placid waters of North Arm, and when about four miles from camp a sail hove in sight, which proved to be the sloop Star, sent after us in place of Big Pete. As the day looked promising, instead of returning with them, we determined to keep right on and wait for the push at Dall Head. So after begging some cigarette tobacco and papers we were off. Later, when reaching the straits, a breeze overtook us which allowed of our hoisting the sail and eating a cold lunch of bannock and bacon, the best our chef could offer us before starting.

Meanwhile black, threatening clouds worked slowly up from the southward, while our little craft tipped saucily before the rapidly rising wind whistling over the starboard beam. Being fairly out in the middle, it would take full as long to return to the bay as to advance, and in either case, if the storm increased, we would be obliged to turn and run before it.

When therefore a sudden ugly squall blew the sail off into the water, carrying the sprit halyards away in so doing, we naturally thought "discretion the better part of valor," and as I threw the helm hard around, could not but feel thankful that the wind at our backs was not the fierce Taku wind from the north, blowing us out into the Pacific. Instead, it was only a question of the distance up the straits we would be forced before making a landing.

The problem was soon solved satisfactorily, for about three miles ahead and perhaps a mile off shore lay Wedge Island, which would make a capital place to camp, provided the already strong wind did not carry us beyond. The pull proved easier than at first supposed, and we were soon under the lee of the island and in quiet water.

In making the approach there was time for a rough survey, and we found it to be a much smaller body of land than had appeared from a distance. It was not over 600 yds. long by a third as many in width, heavily timbered, with high cliffs overlooking the sea at both ends, while the center was much the lower, making the island look for all the world like the hull of a Chinese junk.

After beaching the boat and depositing our scanty provisions above tide line, Bill and I pushed back through the undergrowth into the interior of the island in search of drinking water. What little we found was full of animal and vegetable life, and too vile and stagnant to drink without boiling, although Bill, who had traveled much in Arizona, pronounced it capital. While making our way back to the boat, much to our astonishment we discovered comparatively fresh deer sign, and although my "pard" laughed at the idea, I at once untied my rifle from the pack and set out along the shore for

the headland, to hunt up wind, while Bill went with the axe in search of tent poles.

It proved an easy place to still-hunt, having plenty of moss under foot to deaden the sound, and yet there seemed to be enough underbrush to give the game plenty of cover, should they be on the island. I was soon convinced that deer were there, for I found unmistakable signs of their recent drowsing on the skunk cabbage, which in this section grows with tropical luxuriance, and the deer and bear both feed upon it. I have seen this plant as tall as a man, and with leaves as broad as the length of one's arm. This is due to the extremely moist climate, the annual rainfall of Alaska being 14 ft.

The first day's hunt, though successful, was uninteresting. After working carefully in about 200 yds., I ran square upon two blacktails—a spike-horn and a doe. Both of these I dropped, making a pretty "right and left," precisely as though bird shooting with a Scott instead of deer hunting with a Winchester. On dressing them both I shouldered the buck, and upon reaching camp found Bill had but two of the tent poles cut, showing how short a time had elapsed since we separated. Although the provisions brought with us consisted only of flour, salt and tea, still with two fry-pans of tenderloin, we feasted royally. Soon after pitching the tent rain set in, and throughout the afternoon and night the storm continued with unabated fury, while I lay awake for hours listening to the mighty pounding of the breakers on the headland, which seemed to shake the very ground beneath us.

It was not necessary to look out upon the water next morning to know that for that day at least we were to be imprisoned on the island. Although the rain had ceased, both wind and sea continued with unflinching strength, to encompass our little citadel, while from the quiet waters of the cove came the clamoring of hundreds of water fowl that sounded much like a caucus of ward heelers direct from New York.

There were kittiwakes and herring gulls, different kinds of divers, red and black Siwash ducks, beside butterballs, teal and brant, while a dozen kinds unknown to us paddled aimlessly about among the drift timber. A sportive family of seals, doing the "Jack-in-the-box" act in the surf outside the point, drew a harmless fusillade from Bill's six-shooter, and reminded me of glass ball practice in a shooting gallery.

To kill time that day every nook and corner of our little continent was explored, and we jumped three more deer in so doing—another spiked buck and two does. They were not molested, however, the rifle having been left behind, for already sufficient meat had been killed for ourselves; in fact, one of the mowiches was immediately reserved for our friend Hunt.

We separated at the lower end of the island, and on my reaching camp the sun was shining brightly. Bill, who had, as he called it, been "prospecting" on the beach, and to whom the creatures of the "briney" were ever objects of unmitigated curiosity, returned soon after, his pockets filled with Abalonia shells, hermit crabs, starfish and all sorts of queer things, and in one hand he waved an enormous red and green sea anemone, saying, "I poked my finger inter this and the d—d thing closed up on me. What-der-yer call him?"

One of the hermit crabs he kept alive in the boat for days—"the little cuss was too cute to throw away." He made a collection of shells on this trip that were intended for his mother in Illinois, who had never seen the salt water.

Being anxious to take advantage of the bright sunlight, I asked his immediate co-operation in a plan just formed to photograph one or all three of those deer. This sort of thing was just "nuts" for him, and he went on to tell how two winters before in Montana he had roped an elk while riding in the mountains, and succeeded in fetching it into the town of Kalispell.

So, armed with the camera, we headed for the vicinity of the island, where the deer had been last seen. We figured that could they be driven to the narrow strip of headland where there were but few trees and very little undergrowth, a good picture might be taken and at close range.

In the low swampy section we jumped them again, but the buck dodged through us, much to the disgust of my partner, who wanted to "corral the whole cheese." The two does bounded along ahead, however, apparently not alarmed to any extent, even stopping to look back occasionally. Fortune seemed to favor us, for without the least hesitation they trotted out upon the narrow strip, which is not over 20 yds. in the widest part. Along this we carefully approached, trying not to scare them. They were bewildered, and did not seem to realize their position until we were fairly close. Then they jumped frantically back and forth, and it was with the utmost difficulty that I prevented Bill from using his Colts. He thought they might become too frightened and jump over the cliffs.

I took a number of pictures from a distance before obtaining the one that turned out to be the best and which is inclosed with this article. At the time of this exposure they had become more reconciled to our presence, and carefully avoiding any sudden movement, I approached to within 40 ft., I should say. Until pressing the button, I fully expected to cover them both, but the larger one, evidently the mother, made a dash by me, and a moment later was followed by her lamb—not, however, before I had glanced through the finder and made the exposure. Seeing this, Bill took his innings, and as he afterward said, "Just turned loose with both hands." There was some lively jumping, livelier shooting and a much-disgusted Bill.

How he ever managed to miss them both is a mystery to me. He seldom has to offer excuses for his marksmanship, and all he could do was to stand and swear. To illustrate his shooting ability I have seen him by the light of a Siwash fire, while lying on our blankets in an Indian shack, kill four mountain rats that were packing off our grub before the last one could reach the door. It was unnecessary after that for him to tell me he could shoot.

During the following night the wind shifted into the northwest, which meant clear weather and a fair wind for us. The sea still ran too heavy for our little craft, however, and it was well along in the afternoon before we ventured out. This time the straits were

crossed without incident. The wind died away, and it was after 9 when Hotel de Siwash was reached.

The latter part of the way we had only what is termed in that country an "ash breeze" (oars of white ash).

Our deer, which Hunt lovingly embraced as his salvation from a bacon and fish diet, was hung in state in the mess-house. And the jovial old chap spread himself that night for a dinner such as had never been eaten at Dali Head. The storm which delayed us had kept our friends as well, and just before supper a volley of shots from the bay bespoke their arrival.

Hunt is wintering up there now; and I will guarantee that as he sits and smokes before the fireplace at the further end of the big house there still rings in his ears the echoes of that night with the "Boston push."

E. W. SHAW.

My Big Bull.

It had long been my ambition to kill a big bull elk. I had tried hard for him on my two previous trips to the Rockies, but fate seemed to be against me, for although the other members of our party in each case got heads, with less work and certainly much less zest than I exhibited, I had never been successful. And now it was 2 o'clock on the last day of our third trip, and, disgusted with myself and everyone else, I had resolved to stay in camp. It was really my fault this time, I thought. I had had a beautiful shot at a grand big bull on the first day out and had missed ignominiously. Besides, what was the use of going again, when we had not seen so much as a fresh track for four days. But my guide felt differently. "Come, Harry," he said, "don't give up so easy; we'll just ride up to the lake and watch a while for him to come and have a drink." To cheer me up the more he saddled up a pack horse "to carry home the head on," he said, but he did not expect to use him for such a purpose any more than I did.

The lake to which Johnny referred lay in a narrow valley, with sides rising rather steeply for a short distance and then selving up more gradually to the top. Looking up the valley the left slope was covered with thick spruce trees, and to the right fairly open, but sprinkled here and there with clumps of quaking-asp, whose little leaves shivered at the slightest breeze. The lake itself was about 100yds broad, there being a large spring on the left or north side near the edge of the spruce. From this spring rose a rock some 50ft. high, over which led a steep trail. And it was toward this rock that we started, intending from there to watch for elk coming to the spring to drink. We found the trail up the gulch so slippery that we had to leave our horses at the bottom and walk up. Our excitement may be imagined when we saw on striking the trail that three big bears had passed and were but a very little way ahead of us, as the water had not yet collected in their tracks. We trailed them to the spring, and as they entered the thick woods, but here we thought it better not to follow further, so we climbed up the rock and sat down to wait, one on each side, behind some bushes at the top.

An hour dragged by and we saw nothing. I was beginning to wish that we had kept on after the bears. What chance was there of their coming back? Then suddenly I heard a rustle in the woods opposite me. I turned my head quickly, but saw nothing. In a minute there was another, and another rustle, each from a different place, and then all was still again, and I could hear only my heart banging away in my breast and the soft click-click, as I threw a cartridge into the barrel of my rifle. Now I heard them again, sometimes separately, sometimes all together, but steadily coming closer and closer. "The three bears!" I thought; "and they will come back up the trail right over me." Should I call Johnny? No, I would try it by myself. I looked back over my shoulder, nevertheless, to see if he was in sight, but no Johnny could I see. I turned quickly back as I heard another noise, and there I saw, not a bear, but the great white hindquarters of an elk. This was all there was; just one big hindleg, and I could not tell whether it was a bull or a cow. It certainly looked big enough to be a bull, but everything assumes gigantic proportions when one is in the condition that I was in. There it stood, it seemed to me, a full five minutes, and then disappeared slowly behind a big fallen tree and all was still again.

I waited to see him reappear, but he had probably smelt me, as he did not so much as break a twig. I was just about to crawl over to tell Johnny, when I felt a touch on my shoulder, and turning saw him pointing up the lake, where two cow elk were just entering the bushes which grew thickly over the bottom of the gulch.

"There's eight or ten," he whispered; "been wallerin'. Oh! but there's a daisy amongst 'em."

I told him what I had seen, but he decided to follow this last herd, which did not suspect us, especially as we knew there was a big bull with them. So we started down the little hill and past the spring, past the "wallow," and then sometimes on hands and knees, sometimes crawling and writhing flat on the ground, we made our way through the tangle of roots and bushes to the opening where we had last seen our game. Just as we reached here, from the timber on the hillside the old bull "bugled." To one hearing this for the first time and from a distance, it is one of the most beautiful sounds imaginable. Rising clear from the silence of the forest, it floats along with purer note than ever man can make, then gradually descends and dies away into stillness again.

We immediately started after him, easily picking his track from the rest of the band by its size and deep impression. Every few minutes, now, he "bugled," sometimes seemingly but rooft. or so ahead; but owing to the extreme thickness of the spruce we could never catch sight of him. Thus we followed him for almost a mile, I stumbling over logs in my efforts to walk quietly, and breaking twigs and branches at every step, and Johnny stealing noiselessly ahead, with his eyes on the big bull's tracks. The high altitude makes it extremely hard for one unaccustomed to it to walk fast for any distance, and so I had to call a halt to get my breath.

As we were about to start on again the bull "bugled" from the open hillside on our right, and we started at full speed down the hill expecting that now we would surely catch sight of him. As we reached the bottom we heard him again, but the echo made it extremely

hard to tell from what direction the sound came. I still thought he was on the right side, but Johnny said he had crossed back into the spruce, so we started up hill again on the run, Johnny carrying my rifle. We went on for about 100yds., when of a sudden the "bugle" came again, the direction unmistakable this time. I turned, and there he stood in plain sight across the valley 300yds. away, his head and antlers held high, looking over at us and "bugling." Johnny gave me my rifle, and I put it to my shoulder, but the last run had so taken my breath that the sight swam round and round and the rifle barrel described great circles in my vain efforts to steady it. But suddenly it flashed across me that this was the last day of the hunt, it was 5:30 in the afternoon, and here was the chance I had been hoping and longing for so long. What would I think of myself if I missed? So I drew a long breath, tightened every muscle in my body, drew the front sight just behind his shoulder, pulled the trigger and at the report tumbled over in a heap in the spruce needles. The bull threw back his head, bounded quickly up the hill and disappeared in a clump of quaking-asps. I couldn't have fired again to save my life.

Johnny picked up my gun and started down through the trees, shouting, "Come on! come on! you may get another chance!" So summoning what little strength I had left I followed him.

When we reached the other side of the quaking-asps we looked for the elk, but there was no elk in sight, and I turned questioningly to Johnny, but Johnny only gave that quiet smile of his and pointed to a branch sticking up out of the grass 50yds. further on, and as I looked, it dawned upon me what that branch really was, and that beneath it lay the great white body that I had coveted so long.

H. S. D., JR.

A Trip for Venison.

ON Nov. 10, 1869, I left the quiet village of Hartford, Van Buren county, Mich., taking my 10-gauge steel double-barreled shotgun and an 18in. gauge .44cal. thunderbolt carbine, and drove twelve miles northwest into what was known as the Fish neighborhood, in the township of Deerfield, which was at that time an almost unbroken wilderness, where wild turkeys, deer and red fox were very plenty. After going to within two miles of Lake Michigan on a newly cut road I came to a log house just built, in front of which a young man about twenty-five years of age was cutting wood. I asked him if I could get board for a day or two, as I wanted to hunt. He said he would board me if I could put up with his accommodations, as he did his own cooking. I told him I thought I could stand it for a day or two if he did all the time, so he told me to go into the house, it being about night, and quite cool, and as soon as he got that tree cut up he'd come in and get supper.

During the evening he related to me the number of deer he had seen in various places in the immediate neighborhood, and I inquired of him the best place for me to go the next morning to find a deer. He said Thunder Mountain was directly west about a mile and right on the edge of the lake. I found that Thunder Mountain was a big, round-topped sandhill of more than ordinary height, so called from the rumbling sound, like distant thunder, which came from it at times. Just north of the mountain was Clay Cliff, a nearly perpendicular cliff. North of this was what was known as the big sand-slide, caused by the constant blowing of the wind from the lake, blowing the sand in different directions, ever changing form.

My host, Mr. Smith, told me that the Carpenter boys, who lived about three miles from there, and kept three or four hounds, were always driving deer into the lake. He said the deer invariably took the route from the timber to the water over these sand drifts, where the shifting sand effaced all trace of their tracks. There was another sand-slide two miles north of this, and the deer were driven to water almost daily through one or the other, for the dogs hunted even if the men did not. He said in all probability, if I stood at the foot of the big slide I'd get a shot at the deer before 10 o'clock the next morning. He had an old hound, so he said he'd take his dog and start him after a deer, who would drive the deer to the lake even if it took him all day. But he had not time to hunt, and after starting the dog he would have to come back to his work. He gave me a lunch of johnny-cake and bacon, and I took my guns and started for the foot of the sand-slide.

A sharp walk of half an hour brought me to the beach of Lake Michigan. I had followed the valley of a little stream known as Stony Creek, which emptied into the lake just south of the base of Thunder Knob. A walk of a half-mile north along the beach brought me to the foot of the sand-slide. I unslung my carbine and hung it on the big root of a pine stump which had been washed ashore and was nearly covered with sand, and got ready to shiver, for the wind was in the northwest and the breakers ran mountain high. The day was cold and chilly, and the roar of those mighty waves was enough to drown the rumble of a thousand cars.

I had stood there perhaps an hour, and was longing to see the graceful bounds of a fleet-footed deer, when I heard a strange noise in the water behind me. Turning, I saw within four or five rods of me a large buck wading out of the water and shaking himself. Knowing that he had been run into the lake away north and drifted south with the wind, and was chilled by cold of wind and water, I sat my shotgun against the pine root, took down the carbine and let the gallant old fellow get to where the water was about knee-deep; then there was a sharp crack of the carbine and the noble deer was dead. I felt almost ashamed that I had killed an innocent beast, which was so chilled and exhausted that it had not noticed me. But setting down my carbine I took hold of the great antlers and drew him out of the surf. I had just finished bleeding him when glancing up the beach to the north I saw three men and two dogs coming toward me. I thought that they were the men and dogs who had driven the deer into the lake.

They approached and said: "Well, friend, you've killed a nice deer; our dogs drove him into the lake two miles north of here two hours ago, and we have been watching for him ever since. Had he got out of the water when you shot him?"

"The water where I shot him was about knee-deep."

"According to the rules of we lake hunters he's our deer. If you had let him come out of the water above where the breakers wet, he'd have been your deer."

"What kind of a law is that?"

"The rules of all hunters on the beach of the lake. The deer belongs to the dogs as long as he is in the water."

"That's a mighty little crack to crawl out through."

"If you doubt our word, ask any man who hunts along the beach, and if he don't say we're right, the deer is yours."

I asked their names. They replied: "Carpenter brothers; we live about one and a half miles from here." Thereupon they took the deer and dragged it away up the beach and out of sight. I felt like a boy who has been chastised in school when he knew the other fellow deserved it. I thought of all the law and gospel I'd ever read, and I could find no law to justify such an act. They outranked in numbers, and I had to acknowledge that under some circumstances might made right. I stood by the lone pine root and watched them until they disappeared around a point of the bluff. After they were out of sight, with my eyes still fixed on the point round which they disappeared, I saw three deer come down to the water. I wondered if Smith's old hound was yet alive, and thought I'd never shoot another deer in Lake Michigan. I watched the deer as they ran out, seeming to dread those mighty breakers. In a few moments I discovered that they were coming toward me, running in the surf. As they came nearer I could see their beautiful eyes and ears, and hoped they'd turn from the water on to the sand. Nearer and nearer they came, and my heart fairly jumped as I thought what I could do to get them from the water. As they neared I made a quick move from the pine root toward the lake myself. As I did so, the doe and two fawns ran out on to the dry sand. There were sharp, quick reports from the No. 10 shotgun and the beautiful doe and one fawn lay on the beach. Quickly putting down the shotgun and catching the carbine from the root as the other fawn made two or three quick leaps, then turned to see where the others were, the report of the carbine was heard and the fawn's body rolled down the steep cliff toward those of its companions. Cutting their throats I quickly reloaded and set the guns against the root, and drawing the deer close began dressing them. Looking up the beach to the north, I saw the same party of men and dogs approaching. Before they had time to challenge my right to these deer I said: "I let them all land." They said: "Yes, we saw them from the time they entered the water, and saw you kill them. We have returned to help you dress and hang them up, and want to know what gun you have." They did not see that I had changed guns, and the three shots were in such quick succession they marveled at it. They said they never saw a shotgun that would kill a deer instantly before. As we stood talking they were facing the north and I the south. I saw a stone roll down from the bluff just south of us, and looking up saw a spike-horned buck come into view; and as he made a leap to come down the steep bank I took my gun and said: "Now, see." As I spoke I shot, and the buck came tumbling down, dead. He was followed by Smith's old hound and was indisputably my game. The men whom I at first suspected of meanness had shown themselves to be gentlemen, and after hanging up all four of my deer we separated.

I returned to Smith's home and reached it in good season for supper. I related my day's experience, and he said he should have told me of the rules regulating the neighboring hunters. After supper he took his yoke of steers and stoneboat and went for my deer. The next day I had a chance to ride in with my booty on a wagon which was coming to Hartford for supplies. Only those familiar with pioneer days can understand the rejoicing when I reached home after so short an absence with four fine deer.

SULLIVAN COOK.

MICHIGAN.

"Concerning an Epithet."

Editor Forest and Stream:

ON the editorial page of the FOREST AND STREAM for March 18, there appeared a well-written—that goes without saying—article on that most despicable type of the genus homo, known in common parlance as the "game hog." As a reader of FOREST AND STREAM from almost the initial number up to that issued March 18 of this year I always have, and do still consider that paper one of the grandest exponents of game protection and preservation; hence it is an unpleasant task to take exception to any item in its columns, more especially when that item is the product of the editor's quill. The item to which I refer is in my humble judgment one that comes dangerously close to a defense, or at least a palliation of the ways and methods of those so-called sportsmen who take more of the public's game than fair-play sportsmanship would warrant. Had the article to which I refer appeared in any of the papers devoted to general topics, no great harm would have been done; but its appearance in FOREST AND STREAM will perhaps be instrumental in causing some, or possibly many, "game hogs" who were beginning to see the error of their ways, to retrograde to the "kill-all-you-can" idea.

I may be a trifle old-fashioned in my ways; if so, my education—want of it, perhaps—is to blame; but in years gone by I was taught to call a spade a spade; and in the part of the country where I grew up and learned to shoot we had a habit—inelegant, perhaps—of calling a man who committed larceny a thief. When a man stole any of his neighbor's cash or property we did not say that he was color-blind and unable to distinguish between his own or his neighbor's hens or horses; didn't even call him a kleptomaniac; just a plain, common, everyday thief. When a man in our locality, under the unchristian plea of "business is business," robbed or oppressed his neighbor, or exacted to the utmost his "pound of flesh," even from the widowed and the fatherless, we had the uncouth habit of calling that person a hog—not a swinish individual, nor a Mosaic outcast, but just a plain hog—not an elegant term, we must admit, but the only one that completely filled the bill, without wasting wind or printer's ink.

Now, Mr. Editor, I am old-fashioned enough to believe that a man who calls himself a sportsman, or even one who does not attempt to assume the dignity of that title, has no earthly right to take more than a reasonable share of the game that is the property of all, and when he does overstep the limit of decency in that direction I know of no term more expressive or more fitting than that of "game hog," however inelegant it may be. Nor can I agree with you that it is a difficult matter to say just what amount of game should be considered a fair take for one day's shooting. Common sense, or a sense of sportsmanlike decency, should teach any man that a hundred, or even fifty ducks, geese or grouse—almost a cart-load—is away beyond that limit ideal which is deep-rooted in the mind of every fair-minded sportsman. Neither do I, nor do I believe that any very large percentage of our true sportsmen will agree with you that fifty birds of any kind—clay pigeons or English sparrows excepted—are a legitimate bag for a sportsman anywhere, whether it be in Mississippi or on Long Island, in Vermont or in Texas. In days gone by in localities where game was plentiful, everybody helped himself to as much as he liked, or at least as much as he could shoot, kill or capture, and what is the result? Look at the buffalo and the wild pigeon—mounted specimens are to be seen in our natural history collections, a few stray live ones, they tell us, are still on earth—their fate tells the whole story, unlimited killing.

I am ashamed to confess that I once killed between sunrise and sunset twenty-two ruffed grouse on ground where at this time it would be impossible to bag a half-dozen in a week. The same cause—the "game hog." I know whereof I speak, for I was one of them twenty-five years ago; but at that time had not sense enough to know how vile a creature my shanks were compelled to carry afield. This happy hunting ground was not despoiled by the market-shooter—none of that accursed breed ever to my knowledge hunted there—but the destruction was the work of Christian, gentlemen sportsmen; at least that was what we thought we were. Admitted that legal restrictions as to bag limit may be and are eminently proper and necessary, it is well known that such restrictions are most difficult to enforce; hence, is it not well for all papers and all persons who have a kindly interest in the matter of game preservation, to let the fellows, who persist in killing more than their share of the State's game, know that we don't care to play in their yard, don't like them, never did like them, in short is it not eminently proper that we should designate them by their proper names, "game hogs," however inelegant the term may sound? If we fail to reform them we can at least show them that we are not of their ilk and detest their unsportsmanlike ways. M. SCHENCK.

On Kansas Prairies.

LOST SPRINGS, Kan., March 11.—*Editor Forest and Stream:* I hear with regret the reports from other parts of the country of the injury to the game by the terrible storms of the past winter, and so I am the more glad that after such investigation as I have had time to make, I can report that both quail and prairie chickens have lived through all right in this section. I have seen a number of good strong bevys of quail and some chickens since the storms, and have found no dead birds. This is owing, I think, to the abundance of both feed and cover furnished by the grain called kaffir corn, and I would recommend this grain as without any exception the best for any game preserve wherever it will grow; I do not know how far north that is, but surely anywhere in line with northern New Jersey, and I think much further northward. It has thick leaves and very strong stalk that does not break with the weight of the snow, and yields twice the grain that wheat does. The height from 4 to 5 ft. All the birds feed on it here from the wild goose down to the English sparrow. Can be obtained of almost any seedsman in Kansas.

I do not think the days of the prairie chicken are numbered as yet, for all reports go to prove that since the law stopping the shipping of them was put in force, they have slowly increased in this section. The residents here pay but little attention to the letter of the game laws; but are very jealous of any shooting for shipment, and that, of course, is the very best of game protection. When I first went to Emporia six years ago the chickens had almost disappeared; but now they are slowly working back there. The great alfalfa fields are taking the place of the prairie sod; but they come to stay, and the chickens are learning to love them as well as the prairie grass. They also seem to follow and increase with the increase of the fields of kaffir corn, of which I have spoken.

I am glad your paper is bringing out so much discussion about the skunk. I suppose I run the risk of ostracism when I say I think them a friend both to the farmer and sportsman. I know they love a good fat chicken, but do not suppose one skunk in 500 ever tastes of one. But let any farmer go into his plowed fields in the fall and count the holes—about the size of a small dog's foot—in a square rod of ground, and for each one give our strong-smelling friend credit for a noxious worm or grub destroyed by him, and he will get some idea of the good he does; and when he finds him under his grain stack or in his corn shock, remember he is after mice and rats and let him go his way. Do not think he injures the game much, for along a certain hillside in Emporia, which apparently has been the stamping ground of the skunk for many years, the quail each year bring out one or more good strong bevys. In my opinion the common brown rat does more damage to the birds than all the skunks, foxes and hawks put together, and the skunk is their inveterate enemy. But the murderous breechloader, and the man behind it, and that means—you the editor, you the reader, and myself—are, after all our talk, the worst scourge of the game.

What a plucky strong lived bird the quail is. A young man with whom I was shooting last fall brought down out of a bevy of good strong young birds what seemed the mother of the flock. She had lost apparently the season before one foot, but had lived and brought up a brood of young birds, part of them for our delectation. When we picked her up and realized her strong courage, we were sorry she had not escaped. But, of course, regrets were in vain and she went the way of so many good quail.

Would like to ask if the ruffed grouse is not to a certain extent like the squirrels—migratory. I have not seen one in Kansas, but when in New England I could not explain their habits in any other way.

March 13.—One of the local papers reports the capture of three beaver in the Cottonwood River, about twenty miles southwest from here. It seems too bad that the few remnants of such wild life as remain cannot be left undisturbed. I would go a long way myself to see one free and living his natural life.

I trust you will excuse the writing on both sides of the paper, for paper is getting very scarce, and I am in camp miles from any place of supply. The geese, duck, killders, plover, blackbirds and some of the smaller birds are here. Meadow larks stayed all winter in spite of the storms.

PINE TREE.

Spring Shooting.

IN the New York Legislature a bill has been introduced by Mr. La Roche, Senate No. 179, to open the season for snipe and shore birds on Long Island on May 1 instead of July 1, as under the present law. Mr. Robert B. Lawrence, Secretary of the New York Association for the Protection of Fish and Game, appeared before the Assembly Committee on Game Laws to oppose the measure. In this connection we give the brief prepared by Mr. Lawrence in opposition to a former bill of like purpose. All that was then said applies now, and always will apply. Measures and men may change, but the principles of the laws of nature as here laid down are immutable. Mr. Lawrence said:

This bill should not become a law for the reason that its passage would be a step backward, and directly opposed to the idea of proper game protection.

In May, 1892, the present law prohibiting the shooting of plover and other birds during the spring months was passed, the opening of the lawful season for shooting them being postponed until July. The result of the five years, in the increase of the numbers of these birds which visit our salt marshes and beaches during the summer and fall months, has been noticed and favorably commented on by many who are interested in preserving our game.

Before the passage of this law, the diminution in the numbers of these birds was so marked that there was but little opposition to the enactment of the law which protects them during their short stay in the spring on their way to their breeding grounds. The numbers which visit our shores in the spring have increased to such an extent that baymen and gunners, failing to realize the fact that the shooting has been improved during the summer and fall months, when a far greater number of our sporting population care to indulge in this pastime than during the spring months, and that the birds, by reason of the fact that they are not molested during their short spring sojourn, have come to look upon our shores as a refuge place, again wish, for the sake of a few dollars, to bring back the conditions which existed before the passage of this present law.

It is true these birds are migratory, and with the exception of the spotted sandpiper (*Actitis macularia*), the piping plover (*Actitis melodia*) and the field plover, or Bartram's sandpiper (*Bartramia longicauda*), do not breed within our borders, and arrive in flocks for the most part. But in many cases they are mated before they leave us in the spring for their northern breeding ground. Particularly is this the case with the big yellow legs (*Totanus melanoleucas*), which soon pair off, and while searching for their food the spring call notes of the males, differing entirely from their whistle of the summer and fall, are recognized by the baymen and gunners as a sure sign of their being mated or about to mate.

The black-bellied plover (*Charadrius squatarola*), one of the most noticeable varieties, also usually consummated its family arrangements during its sojourn with us. Undoubtedly the greatest part of these birds migrate at some distance from our shore, but it is nonsense to assert that the killing of those that do visit us in the spring will have no serious effect on the numbers which return with their broods in the summer and fall. The improvement in the shooting in the summer and fall which we have already spoken of, is certainly proof of the absurdity of this assertion.

These birds are not generally considered hard to shoot at any time. Their gregarious habits enable the gunner to decoy them within range, and while, in the spring they are old veterans, more wary and suspicious, the fact that they are less easy to kill at that time is a poor argument for legalizing their slaughter.

The best traps shots are frequently indifferent field shots, and their judgment as to the difficulty of bagging birds is not entitled to much weight. The old baymen, who would possibly do but poorly at the trap with the crowd around him, seldom fails to down the poor bay bird that comes within range of his shotgun. The numbers of these birds are now on the increase so far as our shores are concerned, and we do not wish to return to the condition which prevented any opposition to the passage of this law, because the birds were so scarce that their killing or non-killing was considered a matter of no importance.

There was a time, as I have heard my father say, when a native bayman would not shoot a single dowitcher (one of the best of these birds for table use), for it was not considered worth a charge. Before the passage of this law an ox-eye was considered a fair mark, at least for a visiting gunner, and a dowitcher a rare prize.

Further than that, they are poor eating in the spring in comparison with their condition in the summer, and the presence of eggs in the female, as frequently happens, is not an appetizing discovery for the one who cleans them, and the physician who would order a big yellow leg killed in May as a delicacy for a convalescent would hardly be considered a gastronomic authority.

"Spring vitality" is not a rule considered a desirable feature in a bird intended for a table.

Spring shooting is allowed in New Jersey, except in the case of the Wilson or English snipe, but a strenuous effort is at present being made to secure in that State the passage of a similar prohibitory law to that in force in New York.

The majority of the States which permit spring shoot-

ing lie to the south of us, and the arguments against their shooting at that time are less worthy of consideration than when the birds approach nearer to their breeding grounds.

Connecticut and Rhode Island permit spring shooting, but in Massachusetts shore birds cannot be killed between May 1 and July 15. In New Hampshire the close season is from Feb. 1 to Aug. 1, and in Maine the shooting of these birds, under the general head of plover, is prohibited from May 1 to Aug. 1.

The shooting season should be entirely restricted to the southern migration of these birds. The present law is directly in the line of game protection, and while now, thanks to the increase in the numbers of these birds, directly attributable to its work, it may continue to debar the baymen and gunners from doing that which a few years ago they did not think worth doing, it should not be said to be legislation directed against them. What they lose in the spring they more than gain during the southern flight.

Those who wish to again have the privilege of shooting these birds in the spring are a very small portion of those who make their livelihood along the bays of our sea coast. "Penny wise and pound foolish," for the sake of a few dollars they are willing to again drive from our salt marshes and beaches these winged migrants.

But the vast majority, in view of the object lesson which our present law furnishes, and the beneficial effect of the abolition of spring shooting, would regret exceedingly a repeal of this present law.

In most of the States spring shooting is being forbidden. You cannot kill your mated birds and expect the broods in the fall.

The law as it now stands is a good one; it looks simply to the preservation of these birds. It cannot be considered unreasonable, and while it may be difficult to enforce so long as a market for dead shore birds exists in New York, still that last statement is a poor argument for erasing it from our statute books.

(Signed) ROBT. B. LAWRENCE,
Of Counsel for the New York Association for the Protection of Game, 35 Wall Street, New York.

JEFFERSON COUNTY SPORTSMEN'S ASSOCIATION.—Watertown, N. Y., March 13.—*Editor Forest and Stream:* There are two bills of vital importance to the sportsmen of this State that are meeting great opposition in the committee at Albany. The market-shooter and game dealer are fighting against us for all they are worth. There is only one way that we can win this battle, and that is to let our representatives understand that we want spring shooting of wildfowl and the sale of game stopped in this State; and the only way we can do this is to write a personal letter to our Assemblyman and Senator asking him to support these bills. It is of the utmost importance that you write to-day, if you do not the bill will never get out of the committee. W. H. TALLETT.

Game and Fish Map of New Brunswick.

ANGLERS and big game hunters whose excursions in search of game or fish lead them to the little known regions of New Brunswick, will not fail to be interested in a map shortly to be published by the Forest and Stream Publishing Company. This map has been especially prepared for the FOREST AND STREAM constituency by the official draughtsman of the Province of New Brunswick, and no pains have been spared to make it accurate, both as to its topography and as to the points which more especially interest sportsmen—the localities where big game and fish are most abundant. On the map those areas where big game is found are enclosed in wide red lines, the streams where good trout fishing is to be had are marked with blue crosses, and the rivers which salmon ascend are marked by blue circles. Thus, at a glance, the sportsman has before him all the possibilities of the region.

As a matter of fact there are no streams in this region which do not contain trout, and these fish occur also in practically all the lakes. Similarly, salmon are found in varying numbers in all the larger rivers. To pin down the game which roams the forests and the barrens is not so easy, yet on the map in question, this has been done, and we believe with a great degree of success. Of course, moose, caribou and deer do not always stay in one place. They migrate with the seasons, and may occasionally altogether desert a tract where formerly they were abundant. The most that can be done by any map maker is to set down the conditions of to-day, and this has been done in the FOREST AND STREAM New Brunswick Map. The map is 24 by 30 in., is printed on tough linen paper, and for convenience of carrying, is enclosed in a stout manila pocket.

The Expensive Barn Method.

ON Feb. 21, a deer, followed by a couple of hound dogs, passed the residence of Gideon Richie, of Rochester, N. H. Mr. Richie's bull dog was let loose by his master and joined in the chase, rounding up the frightened deer. Richie captured it and locked it up in his barn. He came to this city and notified the mayor that he had an injured deer in his barn. He stated that the animal was badly hurt and asked permission to kill it. The mayor notified John Bulldore, of this city, a fish and game warden, to investigate the case, and if the deer was injured as badly as Richie represented, to kill it. Bulldore went to Richie's place and with him decided to kill the deer. The Rochester warden dispatched the poor animal with a hammer. One of the men took half the carcass and the hide and the other the other half of the carcass. In dressing the deer it was found that it had two fawns. Fish and Game Commissioner Wentworth was notified and immediately went to work on the case. He found eight witnesses who testified that the deer was but slightly injured, having a scratch on the nose and a slight cut on one of the legs. Yesterday he caused the arrest of Richie and Bulldore and tried them before Judge Wentworth, of this city. As a result, Bulldore was fined \$100.

Death of the Last Deer in Tioga County, N. Y.

The last deer in Tioga county, N. Y., met a tragic death, and as far as I am able to learn, the story is correct.

Jerry Van Duser, a farmer living at Catatonk, a small hamlet five miles north of Owego, was engaged during the winter of 1858 in cutting wood. He fixes the date from the fact that it was the year of his marriage. There was snow on the ground at the time.

One morning, while passing through a piece of woods on his way to work, he heard a noise, and turning, saw a buck deer coming down a skidding trail, or wood road. As the animal had not seen him he stepped behind a tree, and slipping the dinner pail off his arm gripped his axe and awaited the deer's approach. When the animal came within reach, Van Duser jumped from his hiding place and hurled the axe at the deer, striking it in the shoulder, but not disabling it. Returning to the house, he procured a gun and started in pursuit, but did not overtake the game before nightfall, although traces of blood were abundant, as were indications of the animal's having laid down. The next day he continued the chase, taking up the trail where left the night before. He soon came up with the deer, which was lying down, and shot it.

It was a four-pronged buck. One of the antlers is now in the possession of a young lawyer in this village, the other having been used in the making of sundry jackknife handles, and other kindred uses.

As far as I am able to learn this was the last deer killed in this vicinity, but if I am mistaken it would be interesting to hear from others claiming the honor (?).

The time is coming when records of this kind will be of value. Let us, before it is too late, record the killing of animals in a country where they are not extinct, that they may be used as reference in years to come. Be sure your records and identity are correct, however.

J. ALDEN LORING.

OWEGO, N. Y.

The Late George T. Freeman.

BOSTON, March 18.—Sportsmen will be pained to learn of the death of George T. Freeman, of Boston, at his home in Arlington. He was forty-five years of age. In his boyhood he conceived a love for athletic sports, as well as a great fondness for natural history. As a young man at work in the watch and jewelry business, he spent much of his spare time in obtaining and mounting specimens. His collection of birds was a rare one, the study leading him naturally toward the woods and waters of Maine. There he took up rod and reel sports with all the zest belonging to a genuine follower of the gentle Izaak. He has visited the Rangeleys almost every year since the early seventies. As a camping companion no man was ever better. Purely unselfish, satisfied with whatever was at hand, it was a charm to be with him. A frequent exclamation of his always spoke volumes: "There, now, I rather see you take that trout than to catch twenty myself!" He was one of the prime movers in the Arlington Boat Club, frequently its president, and always an executive officer. He generally took part in its aquatic sports, and was frequently a prize winner. He was also for some years a crack gymnastic performer in a society of the better class of young men, to which he early belonged. Naturally his love of outdoor life and the beauties of nature led him toward amateur photography, and finally to depicting with the camera some of the finest historic and natural scenes about Arlington, Belmont and Concord. He had also created a series of lantern slides of woods and water scenes about the Rangeleys and in his native town that it is a delight to behold. Last year, though not in the best of health, he packed up fly, rod and camera, and with his long-time sporting friend, O. W. Whittemore, of Arlington, made a trip to the Maine fishing and hunting regions. His purpose was that of photographing live game. He actually stole up to a live moose and snapped the camera several times at him; but alas, the apparatus failed, at a very important moment. Always patient and painstaking, his purpose was to try again, had he lived. SPECIAL.

Maine Deer.

PHILLIPS, March 11.—Word comes from the Megantic preserve by way of Kingfield of a most remarkable deer yard. The yard commences a mile northwest of the base of Mount Abraham and extends in that direction for no less than six miles. A "gummer" from the provinces, homeward bound, told the story to Superintendent Bob Phillips. He was seeking spruce trees in the vicinity, as stated above, when he came into what he thought was an ordinary yard. Finding gum fairly plenty, he worked along slowly and after four days was astonished to find himself yet within the limits of what was unquestionably one mammoth deer yard. He counted no less than ninety deer, bucks and does, and the former had shed their horns, giving parts of the yard the appearance of a bone yard. According to the gum gatherer the deer had not yet begun to leave their winter quarters, although the crust outside would easily support their weight. He traveled entirely without snowshoes, and says the yard, which in places was a mile wide, was beaten down to a regular skating rink surface by the hoofs of innumerable deer.—Portland Daily Press.

A Good Fisherman.

Uncle Barney Cassidy holds the championship as the boss fisherman so far this season. He returned from Fleming Creek last Wednesday with a string containing 112 catfish. Uncle Barney is a man of remarkable physical constitution. Notwithstanding he is between seventy-five and eighty years of age, it is no uncommon thing for him to spend a day fishing on Fleming Creek, oftentimes when the weather is quite cold and disagreeable, and it is seldom he returns home empty-handed. He has lived an out-of-door life and hardly knows what sickness is.—Flemingsburg (Ky.) Gazette.

See announcement of the Woodcraft Magazine enlargement of the Game Laws in Brief.

Sea and River Fishing.

Proprietors of fishing and hunting resorts will find it profitable to advertise them in FOREST AND STREAM.

In the Pound-Net.

BY FRED MATHER.

A personal note from that well-known sportsman, Mr. J. L. Davison, of Lockport, N. Y., conveying an interesting lot of information about the early fishing in western New York, says: "I am too lazy to fish, but will row a boat all day for some other fellow to do the fishing."

Here is one of the men I should have fished with, but have missed, not one of those "unaccountable misses" that riflemen complain of when they wish to shift the responsibility from their sighting to their nerves, but just because there are so many good fellows whose moccasins tracks were not in my way and I never ran into their camps. In this case there is cause for grief because Mr. Davison and I would have made a complete team; he the rower and I the rowee (and we never would have disputed about the time for changing places. We would camp as happily as those "two little bugs in a rug," with no dissensions looming, he being too lazy to fish and I too lazy to row.

This combination is a rare one. Somewhere in my reading there was a verse which illustrated such a happy partnership, but whether it was by Ella Wheeler Wilcox, Robert Burns, Shakespeare, the Vedanta, the most orthodox of the six Brahminical philosophies, the Sagas of the Norsemen, the Book of Lilies of the Chinese, which was written before the beginning of things, or among the words of that pre-historic writer, James Whitcomb Riley, is impossible to tell by one who is an omnivorous reader. But not only the sentiment remains, but the exact words can be quoted. They are:

"Jack Spratt could eat no fat,
His wife could eat no lean;
So, 'twixt them both they ate the broth
And licked the platter clean."

History records no better mated couple. Surely Xantippe would never have absorbed all the adipose rinds of the mutton chops which Socrates left on the rim of his plate, and that greasy old philosopher would not have the oleaginous trimmings from those chops himself, and so he slammed the door when his long-suffering wife scolded.

This is what Mr. Davison writes:

Salmon in Lake Ontario.

"While reading Mr. Chas. Stewart Davison's article on the 'Salmon of Lakes Champlain and Ontario' I remembered that I had lately read something pertinent to the subject in the 'History of the Holland Purchase,' published in 1849, and turning to page 558 I find the following: 'The salmon in their seasons were abundant in Oak Orchard Creek, in Orleans county, at the early period of settlement, and in fact up to 1816 and '18. In the month of June and September the salmon would ascend the main stream and its small tributaries in great numbers, and were easily taken. Sometimes they would ascend in high water, and when it receded would be left upon the banks. They have been picked up in the cultivated fields along the stream after a freshet.'"

"Again, on page 315, the late John Mountpleasant, chief of the Tuscaroras, who resided on the Tuscarora Reservation, a few miles west of this city, says: 'When I was a boy I have taken salmon in the Eighteen-Mile Creek, where Lewiston road crosses near Lockport, and below the Falls of the Oak Orchard, with my hands, 3ft. in length.'"

"Eighteen-Mile Creek runs through Lockport; the Lewiston road crosses it about three miles north, and about seven miles from Lake Ontario, as the crow flies. I remember Chief Mountpleasant well, as he was sixty-eight years old at the time the book was published. He must have been nearly one hundred at his death."

Here Mr. Davison brings up an almost forgotten incident. In a year before 1888—reports not at hand—I personally made a plant of salmon in the Salmon River, which empties into Lake Ontario near Pulaski, Oswego county, N. Y., at a place called Sandy Hill, where once upon a time the sea salmon were plentiful. There was a dam below, near Pulaski, but if the salmon came back and jumped at the dam then a McDonald fishway would be put in, for the alleged inventor of the fishway was the United States Fish Commissioner. Next year I was ordered to send another lot of salmon fry there, and I sent one of my men with the shipment, and with a written order to change cars and go up the Utica and Black River Railroad to Sandy Hill, and there plant his fish. A brakeman told him that Sandy Hill was in Orleans county, and persuaded my man to take the Niagara Falls branch of the Central Railroad to some other "Sandy Hill," and a telegram came to me saying that there was no Salmon River there. Knowing that he was keeping the fish alive by hard work, I telegraphed to him to find a cool stream flowing into the lake and plant them. They went into Mr. Davison's "Oak Orchard Creek."

My remarks to the messenger on his return need not be quoted *in extenso*, although no man under me, since army times, can say that I used profane language to him, no matter how much I was displeased; but, in the presence of the other employees I announced that as every messenger had written instructions what to do with his fish, he must obey his orders, no matter if he thought them wrong, or he would have trouble. The man was a good man, an easy-going fellow, who was faithful to the highest degree, but he erred thinking that I had made a mistake, on the authority of a brakeman, and so Oak Orchard Creek got a plant of salmon. I wrote the particulars to Col. McDonald, with request to let the error pass, and smoothed it over in the State reports.

McDonald, who was a severe disciplinarian and who had been chief of engineers on the staff of "Sewall" Jackson, wrote me a sharp letter, in which he said: "As an officer in the Army of the Potomac one would expect better discipline among your men. You gave a written order. Why was it not obeyed?"

The only possible reply was that while I might have the soldierly training to obey orders, even in the face of death, my men were not so trained, and, while I would take trout into the desert of Sahara if ordered, it was too much to expect the same from a civilian who had not had it drilled into him that he was to obey orders against his judgment, and that he was a mere machine controlled by another. This incident was productive of good; there were no other "mistakes" due to a misinterpretation of orders, and the man who made the mistake never again took his orders from any man on the road. But at present writing I have no word of a great salmon catch either in Salmon River or in Oak Orchard Creek.

I am too old a fishculturist to expect results from single plants of small numbers of salmon, or other fish, in streams where dams, chubs, perch and other obstructionists are frequent. In order to restore a species in a stream you must restore the old-time conditions. If the chubs have supremacy and gobble up the salmon then sock in the salmon fry in such numbers that some escape and come back to feed on the chubs and so restore the balance. Ten to fifty thousand salmon fry in the Salmon River of Oswego county, N. Y., are as good as wasted; the chubs and other fish will take them in out of the wet. They will do the same with as many yearlings.

Put in fishways of the right kind, and then stock Salmon River with a million fish at and above Sandy Hill for four or five years, and there may be a favorable result. The salmon must be able to turn out the chubs, and they are not well adapted for the work, because few salmon feed in fresh water; but enough of them did in the old days to keep the chubs down.

The altered conditions must be considered; there are newcomers, and they must be driven out before we can have things as they were. The salmon must be made the supreme power in the river, or all our efforts are idle. Instead of scattering a few salmon here and there, they should be concentrated into suitable rivers for several years in order to give them a chance against fishes which have occupied those rivers since the salmon were killed out of it. There is a struggle for life in the streams as well as on the land.

Trout in Caledonia Creek.

Mr. Davison further quotes from "The History of the Holland Purchase," and writes: "On page 382 John McKay, Esq., of Caledonia, says: 'I came to Caledonia in 1803. When I first came to the springs trout were abundant in it; and it will surprise trout fishers of the present day, and would perhaps old Izaak Walton himself, if he were living, to learn that they were comparatively tame. When we wanted them we used frequently to catch them with our hands, as they lay under the roots of the cedar trees that grew along the banks. There would be occasionally one weighing as high as 3lbs. It is the habit of the speckled trout to breed in none but running water, consequently they would never breed in the spring, but would resort to its outlet. There was never any other fish in the spring; they have been gradually diminishing, not only in numbers, but in size.'"

"The publisher appended to this the following footnote: 'This last resort, almost, of the speckled trout in all the northern portion of western New York, has within a few years been threatened with entire desertion, or extinction. There is now (1849) a law in operation, limited to three years' duration, which makes fishing in the spring or its outlet a penal offense. The trout, as if ready to co-operate in this attempt to protect them in this seeming reservation, are now rapidly increasing in numbers and size. It is almost a wonder that some greedy pre-emptionist—say a shoal of horned "bull pouts"—are not contesting their rights.'"

And this a half century ago!

From the St. Lawrence to the Gulf of Mexico.

Mr. Davison further quotes from this book the following very curious statement. He says:

"On page 537 I find the following: 'It will surprise those who are not already acquainted with the curious fact, to learn that there is a spot upon the Holland Purchase where the speckled trout passes from the waters of the Gulf of St. Lawrence to those of the Gulf of Mexico and vice versa. About six miles from Rushford, on the Olean road, in the town of New Hudson, the headwaters of the Canada and Oil creeks approach each other, and in freshets mingle, affording the facility for the trout to pass over the dividing ridge.'"

This new route for fish from the St. Lawrence to the Gulf of Mexico is probably a pipe dream that was dreamed as lately as 1849.

Is he an Angler?

While Mr. Davison is not an angler, for he has said it, I heard this story of him from a friend. Last summer he was on the beach at the outlet of Johnson's Creek, near Lakeside Park, Orleans county, N. Y., looking for shore birds, when he saw a darky boy who was fishing for perch lay down his pole at the call of his mother to do some errand. Mr. Davison put his gun aside and took the cane pole and fished, adding a dozen perch to the boy's string, and sneaked off without thanking the boy for the chance to practice the gentle art. The friend happened that way, asked the boy the usual question, and got this answer:

"Yess'r deys good fishin' heah, but somehow w'en I stop to run to de sto' fo' to get some cawn meal fo' mam, de perch come outen de crick an' jes' strings dey-selves awn my string. I don' on'stan' it, but dey's jes' as good fo' breakfas' 'sif dey was cotched awn a hook."

The Stripes on Striped Bass.

A correspondent sends me the following slip from a New York city paper and asks: "How about these stripes?"

Permit me to say, in reply to Angler's remarks in last Sunday's Press, that he is right when he says that striped bass come into the Hudson from the ocean in the spring to spawn, but the bass that are caught through the ice come up the Hudson during October and November in great numbers, and remain until March. They are different bass from those that come in the spring. Every fisherman knows this, as a majority of those that run up in autumn have straight stripes, while those that run up in the spring have a broken stripe.

Great quantities of the spring run of all sizes are caught by

seine fishermen after May 1, and during the summer. If a law could be passed to close the season for bass fishing from May 1 to Nov. 1 it would prevent the seine fishermen breaking up the schools of bass and weakfish that remain here from spring until autumn. Under the proposed law many bass will be caught in the nets during the shad season. Capt. N. B. Lent.
Croton-on-Hudson, N. Y., March 6.

There are not two species of striped bass, nor even two varieties, on our coast. It is true that *Roccus lineatus* was divided by the elder naturalists as Capt. Lent divides them; one naming the species *Perca mitchelli*, and a variety *P. mitchelli, interrupta*, from the interrupted lines, but such distinctions are not accepted now. The interrupted lines are individual variations of color, nothing more. Few of the striped bass in New Brunswick waters have complete lines, but they are the same fish as ours, which is known as "rockfish" south of New Jersey.

If Captain Lent's proposition to close the season from May to November was to become a law of the State, what would we do for bass-fishing in Long Island Sound, up the Hudson and off Montauk Point? Thousands of these good fish are taken from the docks of New York by men and boys between the dates named, the fish running up to rolbs., occasionally. As the fish spawn in late May and early June, in New York waters, they should surely be fair game in July. The only New York law at hand is in "Game Laws in Brief" of May, 1888, and there no close season is mentioned; it merely says that striped bass less than 8 in. in length shall not be intentionally taken.

The So-called "Taylor System."

There may be new things under the sun, but this method of splashing flies on the water is not new. Turn back to FOREST AND STREAM of Sept. 4, 1897, and see, under the head of "Men I Have Fished With," the story of Harry Prichard, an English rod maker, who repaired rods for the trade on Fulton street, New York. He it was who introduced the new fly-cast in our tournaments, where the line was not retrieved, which raised such a row some years ago, but we, who saw its value, backed him up until the cast was recognized as legitimate and allowed in the tournaments; but in a distinct class. I fought this, arguing that no matter how a fly was got out by the action of a rod, it should be legitimate in any class; but the enemy were too numerous. Let me quote from the article named:

"* * * Harry's mode was well known in England, but new to us. It consisted of reeling off some 60 or 80 ft. of line in the water, and then by successive whipping, without apparent advancement, the line would roll out like a wave and the flies would be straightened out in good shape. The advantage of this cast is apparent when trees or other obstacles are in the rear, which would prevent the flies from being thrown behind. * * *

"'Harry,' said I, 'such a commotion as this cast makes in the water at your feet would scare the trout away.'

"'That's just where you're w-w-wrong, me boy. The more s-s-splashin' you m-make the m-more hit brings the t-t-trout to see what's hup. When you goes a s-s-skitterin' for p-pike d-don't you s-splash him your bait han' make a fuss a s-s-skitterin' it hon the surface?'

"'Yes, that's all right for pike or pickerel; but I've been taught to keep as still as possible when fishing for trout. I've even read of men who dropped their flies on the water as lightly as a thistle-down falls; but outside of books we never find such casting. I know some of the best fly-casters in the world—men who in the tournaments and on trout streams are marvels in casting delicately and accurately—but they can't do the thistle-down act. Ordinarily we lay the line out on the water, the middle striking first and the rest following and going beyond, making a ripple on perfectly still water, but which is hidden if there is a slight ripple.'

"'C-can't you m-m-make your flies 'light on the water f-f-first?'

"'Yes, at 40 ft. or less, but that's trick casting and of no use in fishing, for the line must come down on the water just after the flies do, and it makes as much disturbance of the surface as if cast in the regular way. It is done by making a high cast in the air and then checking the line with the rod; it merely serves to astonish those who have never seen it done.'

"'Now that's j-j-just the case with a line s-s-splashin' in the w-water, no m-matter hif you're a-fishin' for pike or trout. So long as you d-don't make hany noise in the b-boat or hon the b-bank, hit's all right.'

The story told here is not in the book referred to and may be crowded out of the "second series" which has been called for, and is put in here to show that all men do not believe in the "thistle-down" theory and that Mr. Taylor is not the first man to advocate putting the flies in with a splash to attract the attention of the fish.

As said above, the "thistle-down" act is easy to do, but in actual trout fishing I never tried it, nor did I ever see any angler work his flies that way; it is a bit of trick-casting that is of no use in angling.

Reason and Instinct.

It is a delightful thing to start a fight, and then get out and see other fellows get in and enjoy themselves. Just now I am waiting to see how Mr. W. Wade will come out after some of the critics of Col. Alexander go for him. On the question of "Reason and Instinct" I have "spoke my piece" and helped the fight, but will let the other fellows give and take the hard knocks, even though I get an incidental upper-cut. The differences seem to be along the semi-religious questions, such as this: "If the dog can reason he has a soul; if the dog has a soul where will we stop?" At this stage of the game I cash in and quit. There is no profit in such discussions, and the only ground that I take is that man is an animal with the power of speech, which puts him at the head of class mammalia. For millions of years he knew nothing but speech, and then invented a system of hieroglyphics and stopped at that for a long time. Up to that time his history is more or less mythical, but is partly recorded in written characters. For centuries before he was able to record his doing in pictorial drawings on his wigwams, he was little above the animals which he killed for food and clothing. Selah!

And no Fly-Casting.

I dropped into the Sportsmen's Show last week and

met a host of friends and acquaintances, and I must have said at least fifty times: "You will have to ask the authorities, for I don't know why they left off the fly-casting, nor why they put in diving from a great height." I had repeated this formula uncounted times and was talking with Mr. S. P. Kellogg, of Elizabeth, N. J., when we heard a splash at the other end of the Garden, and he remarked: "Poor devil! He does that for \$15 per dive; he was hurt on the first day; some day he will be killed." Two days later the diver was buried. The only thing I am glad of is that I did not see him dive. But, if the complaint of last year that automatic pianos and magaphones were no part of a sportsman's outfit, we can say that no man lost his life through them.

The show as a whole was grand, the best of the kind I ever saw, but there was no fly-casting, which drew such crowds last year. The swimming contests drew a crowd, but that is an athletic and not a field sport. In this, the finest thing of its kind ever held in New York, the hunter was well provided for, both with large game and water fowl and rifle and pistol practice. The trap shooters had their contests, but the angler was sadly neglected, having only some live fish in tanks to look upon, and that part was excellent, but there was a deal of grumbling that there were no contests with the rod. As a relief I turned questioner and asked Mr. C. H. Mowry why the angling community was in eclipse.

Mr. Mowry gave it as his personal knowledge that the authorities thought that the fly-casting did not pay. Said he: "They say that the money received for entries in the contests last year was below their expectations, but they overlooked the fact that the contests drew money at the door to more than make up for this."

"You're right," I replied; "every afternoon and evening of the contests the benches were lined with men and women who came in only to see these events and left afterward, to return for the next one. I was here every afternoon and evening last year; this will be my only visit this year, and while I have had my money's worth, I will not come again; curiosity is satisfied, and there is nothing more of interest."

An Early Spring.

Prof. F. A. Bates, South Braintree, Mass., who never tires of propounding conundrums, asks: "Did you see the woodchuck come out on 'ground-hog day,' Feb. 2, to look for his shadow?"

Such questions should not burden the mail with answers, so they go into the pound-net. I hereby state it as a fact, and I ask to be believed when I positively assert that I did not see a ground-hog on the day named, and I roamed from the Brooklyn Bridge to FOREST AND STREAM office, at Broadway and Leonard street, then down Leonard to Mulberry bend, and through Chinatown into the Bowery. They may have been there, I can't deny that, but I did not see them.

There is a "Ground Hog Club," composed of men born on Feb. 2, but where the hole of the supremely excellent hog may be, nor that of the custodian of the amassed clover-heads, is located, is beyond my ken. Prof. Frank A. Bates should seek this information, and, if eligible, join at once.

A trip to a familiar Long Island swamp on March 6, with no other object than just to go through the old swamp, was a joyful change from city life. A bluebird warbled on the margin of the swamp, a flock of black-birds sang "Chowee," and three flocks of geese went over talking goose talk. The pussy-willows were wide open. All these things point to an early spring, irrespective of the ground-hog, and when I saw the bloom of the skunk-cabbage and heard a frog make a remark in a tone so low that I did not quite catch his whole meaning, I said to myself: "Spring is here."

Coming out of the swamp a robin remarked "Tuck tuck," which with my limited knowledge of woods-talk I translated to mean what the old-time circus clown always said: "Here we are again." And so the day was passed in the company of old friends; a rabbit chewing some buds sat on his hindlegs to look me over, but went on with his dinner when I merely said "Hello, Bunny," and did not go his way.

On the hillsides the arbutus was about ready to unfold its buds, while in an old garden the

"Daffodils
That come before the swallow dares, and take
The winds of March with beauty,"

were already in bloom. Surely spring was here.

Next day there was a blizzard. The wind tried to drive the snow away, but only succeeded in making things worse. I got out my snowshoes, but the snow turned to rain and there was a sea of slush in city and country, and there were short rations for bluebird, robin and blackbird, as well as a chill on the skunk-cabbage bloom and the daffy-down-dillies, not to mention a hopeful snowshoer.

Canadian Salmon Rivers.

QUEBEC, March 4.—Salmon fishermen who go to the streams on the north shore of the Gulf of St. Lawrence will be glad to know that in place of the steamship Otter, which was wrecked last autumn, arrangements have been made by the Dominion Government for the carriage of mails, etc., to the Labrador coast during the coming season by the larger and more expeditious steamer St. Olaf, which has hitherto plied between Quebec and the Magdalen Islands. This will probably prove a great bonanza, too, for the provincial government, which has a number of large and important salmon rivers in the eastern extremity of the Province still unleased. Some of them have deteriorated somewhat in late years, through excessive netting, but it will not take long to replenish them, and one of them, the St. Paul, used to furnish 50,000 salmon annually to the net fishermen. There are also still unleased the St. Augustine, the Big Romaine and the Washcotaui. These and others on the same shore will likely be offered at auction during the coming summer.

See announcement of the Woodcraft Magazine enlargement of the Game Laws in Brief.

The Massachusetts Association.

BOSTON, March 17, 1899.—*Editor Forest and Stream:* The Massachusetts Fish and Game Protective Association has completed twenty-five years of its history, and the quarter-centennial was observed by a reception and banquet at Young's Hotel last evening. There was the usual large attendance, and the arrangements being carefully made, the proceedings went off with great eclat. Hon. George W. Wigin, the president, occupied the chair, and at the guests' table were seated Hon. George H. Lyman, Collector of the Port; Hon. George E. Smith, President of the Senate; Judge James M. Barker, of the Supreme Court; Rev. Dr. Arthur Little, ex-Judge James R. Dunbar, Hon. L. T. Carleton, Fish Commissioner of Maine; Edward A. Samuels, Col. H. T. Rockwell, John Fottler, Jr., and Benj. C. Clark, ex-presidents of the association; Wm. A. McLeod, president of the Megantic Club; A. B. F. Kenney, president of the Worcester Fish and Game Club; M. E. Hawes, president of the East Weymouth Fish and Game Club; Wm. B. Phinney, of the Lynn Sportsmen's Club, and Dr. C. W. Raymond, president of the Rehobath Farmer's and Sportsman's Club. There was plenty of music, both vocal and instrumental, a triple quartette organized by Thomas H. Hall, a member of the association, being a novel and decidedly successful feature of the entertainment. The speaking was of a high order, the address of President Wigin being a singularly complete, though brief history of the association from its organization to the present time, showing its periods of depression as well as its splendid success. In full it is as follows:

Fellow-Members of the Massachusetts Fish and Game Protective Association:

To-night we celebrate the completion of the first twenty-five years of our existence as a corporation, and I trust I shall be pardoned for referring somewhat briefly to the salient points of our history as an Association.

To most of us the early history of our organization must be new and interesting, for time has dealt no less harshly with our membership than with the rest of creation. Of the charter members named in the act of incorporation, only one survives, and he has ceased to be a member of our Association. Of the seventy-five or more who enrolled themselves as members at the beginning of our career, only three have retained their membership to the present time. They are Col. Horace T. Rockwell, Henry H. Kimball and Daniel T. Curtis. Of all our members at the present time their experience alone covers the entire period of our existence, and I profoundly regret that it did not fall to the lot of one of them to stand in this place in my stead to-night, for no one can speak of past events so clearly and accurately as he who has actually participated in them. They are with us, however, and I trust that we shall have the pleasure of listening to them before our festivities are over.

Our organization was chartered by our Legislature by an act which became a law March 18, 1874, under the name of the Massachusetts Anglers' Association.

It was incorporated, as set forth in its charter, "For the purpose of securing and enforcing proper restrictions upon the taking and killing of fish, shellfish and bivalves, the promotion of fishculture, and the introduction of new species and varieties of fish, and to disseminate information relating thereto." Three years later the name was changed to the Massachusetts Fish and Game Protective Association, and its purposes were enlarged so as to include the protection and propagation of game as well as of fish, shellfish and bivalves.

The original act was passed by the House, March 10, 1874, and is attested by John E. Sanford, Speaker; by the Senate, March 17, 1874, and is attested by George B. Loring, President; and was approved by the Governor, W. B. Washburn, March 18, 1874. The persons named in the act were: John P. Ordway, C. Warren Gordon, Charles Stanwood, Elnathan Delano, James Walker, James P. Richardson, Walter M. Brackett, Baylis Sanford, John F. Mills.

The first meeting under the charter was held at the Parker House, in Boston, March 30, 1874, at which meeting all the charter members were present. At this meeting a president, secretary and treasurer were elected, and a constitution and code of by-laws adopted.

The following vote was then passed: "That all persons who are now members of the Massachusetts Anglers' Association, organized Feb. 7, 1873, and who shall sign the constitution and by-laws of the Association in the roll of membership be, and they hereby are, elected members thereof." The meeting was then adjourned to Codman Hall, April 3, 1874, the date fixed by the by-laws for the annual meeting.

At the meeting held April 3, after the reading of the records, a recess was taken to enable those members of the old organization who desired to sign the constitution and by-laws, and the record states that "seventy-five persons responded on the roll of membership." The meeting then proceeded to elect officers for the ensuing year. Among the officers elected was the Hon. Thomas Talbot, then Lieutenant-Governor, who was elected first Vice-President. Mr. Talbot by successive elections continued to hold this office until the time of his death, in 1885.

Before the month expired, by the resignation of Governor Washburn, Mr. Talbot became Governor of the Commonwealth. This office he held by election in 1879. So that for a portion of the time of our existence, nearly two years, a Governor of the Commonwealth has not deemed it beneath his dignity to serve as one of our vice-presidents.

If the character of an organization is to be judged by the character of its members, and I think it ought to be, we may justly take pride in the high standard of our own Association; for it has carried upon its roll of membership the names of no less than five Governors of the Commonwealth, namely, Thomas Talbot, William Gaston, Alexander H. Rice, Oliver Ames and J. Q. A. Brackett. Among the distinguished names which adorn our roll of membership may be found those of Prof. Alexander Agassiz, Prof. F. W. Putnam, Hon. Theodore Lyman, Hon. Henry L. Peirce, Hon. John E. Thayer, Hon. Daniel Needham, Judge Chas. Levi Woodbury, Judge Asa French and many others, which I will not take time to enumerate.

I do not refer to these things in any boasting or vainglorious spirit, but rather to show you what the member-

ship of this Association has been, in order that we of the present day may strive to maintain and carry forward that high standard which our predecessors have transmitted to us.

Numerically considered, our membership has been somewhat varied. Starting in 1874 with 75 members, our numbers constantly increased until at the end of three years we carried upon our rolls 512 names, divided as follows: Honorary members, 56; life members, 16; yearly members, 440; whole number, 512.

Following the year 1877, the decrease in membership was rapid. At the annual meeting in 1880 only eighteen members were present, and the following year only twenty. Twenty-two members resigned in one month, and meetings were frequently adjourned for want of a quorum. In 1880 the membership probably did not exceed 100. From 1880 to 1885 there was a slight gain in membership, but the Association was in so precarious a condition that at the annual meeting in 1885, four different members were severally elected to the office of president before that office could be filled. For the next five years the membership rapidly increased. In 1889 162 members joined the Association, 52 joining at one meeting. In 1891 we carried more than 500 upon our rolls.

Since 1891, owing to hard times, and a more rigid enforcement of our by-laws as to the payment of the annual dues, our membership has somewhat fallen off. We now carry upon our rolls 230 members, and our numbers are again steadily increasing, 20 new members having joined us within the last two months.

Our financial condition has, of course, varied somewhat with our membership. Starting in 1874 with a balance of \$173.41 in the treasury, at the beginning of January, 1898, the treasury showed a balance of about \$1,500 on the debit side of the account. The officers of the Association, aided largely by the energetic efforts of one of our present members, Mr. Ivers W. Adams, by subscriptions and contributions, succeeded in raising enough money to wipe out this deficit before the annual meeting in April of that year. The treasurer's report at that meeting showed a balance of \$77.47 in the treasury.

From that time to this the treasurers' reports present an unbroken series of balances in the treasury at the end of each fiscal year.

In 1879 our constitution was amended by inserting a provision that "50 per cent. of all surplus money in the treasury at the end of each year shall be added annually to the Association Fund." As to the purpose of this fund, our records are silent, and for ten years from its enactment, this provision of our constitution seems to have been overlooked, or entirely ignored, but in 1889, some of our members insisted upon the observance of this provision. That year one-half of the surplus of \$500 was set apart and deposited in the savings bank as a fund. From that time to the present a similar deposit has been made at the end of each year, so that at the present time that fund amounts to \$2,866.92.

From its beginning, the Association became actively engaged in carrying out the objects for which it had been chartered. The records show that the attention of its members was early directed to such subjects as the preservation of fish in our inland lakes and streams, the decrease of fish in Massachusetts Bay, the destruction of lobsters on our coast, the preservation of trout in our streams, and the seining of smelts in our bays.

That there was abundant need of action on the part of some one is shown by the following lines, which I have copied from those records: "But the most important phase of the subject relates to the future supply of fish. Last year (1874) we were nearly deprived of smelt; full-grown lobsters are now almost unknown; while trout and salmon have hardly yet, under the influence of stringent protective laws for several years, recovered from the effects of their almost total annihilation by being caught while in spawn, before the laws were enforced."

From the beginning our records show an earnest, persistent and disinterested endeavor on the part of the Association to secure such laws as would tend to the preservation and increase of our useful food fishes for all the people of the Commonwealth, and to see that those laws are enforced.

At the very first meeting of the Association a committee was appointed to secure a law prohibiting the sale of fish, particularly trout, during the close season.

At that time, while we had a close season on the taking of trout between Sept. 20 and March 20, it was lawful to sell trout taken in other States, during that time. This led to protests from other States, as well as to great abuses under the law of this State.

Trout caught in this State were openly sold in our markets during the close season, but it was impossible to convict the seller in our courts, because of the difficulty of proving that the trout sold were caught in this State.

The committee secured the passage of a law making the close season from Aug. 20 to March 20, but in other respects it was as defective as that of 1896, which it superseded. No convictions could be secured under it, and for the same reason as before.

In 1876 George D. Robinson, afterward Governor, was a member of the Senate from the Second Hampden District. He drafted a law, and aided in its passage through the Legislature, absolutely prohibiting the sale or possession of trout, landlocked salmon, and lake trout, during the close season, which was made from Oct. 1 to April 1 in each year, and made the possession of such fish during the close season *prima facie* evidence of a violation of the law. Many and fierce have been the contests of our Association over proposed modifications of this law, but its main features have remained unchanged to the present time, and stand as a testimony to the skill and sagacity of our departed Governor.

Year after year committees from our Association have gone to the Legislature and asked for wholesome legislation for the preservation of our fish and game. Year after year those committees have succeeded, little by little, until at last our laws are beginning to assume an effective condition. Those laws to-day are by no means what they should be, but they are infinitely better than they were when the work of this Association began.

Our records abound in instances of convictions secured for violations of our trout laws, our smelt laws, our lobster laws, and other game laws.

One of the cardinal principles of our Association is the dissemination of information upon fish and game culture

and fish and game protection; and the degree of unfamiliarity with those subjects which we encounter whenever we attempt to secure some wholesome legislation, leads to the conclusion that we have still another broad field for useful work. From a somewhat cursory examination of our records, I estimate that from fifty to seventy-five lectures have been delivered before the Association during the twenty-five years of its existence. These lectures have been largely upon subjects connected with our work, and from them we have received and disseminated a large amount of useful and valuable information. In the dissemination of this information to the public, the press has ever been generous in the aid which it has rendered to our cause. It has done more for us than we have had any right to expect; and I hereby take this occasion publicly to express to the press our hearty appreciation of the favors which we have received at its hands.

At the second meeting of the Association, held April 17, 1874, it was decided to have copies of the game laws printed for distribution throughout the State, with the following notice: "The executive committee of the Massachusetts Anglers' Association hereby give notice that the provisions of the above law will be strictly enforced, and any person giving information of the violation of the same will confer a favor by addressing C. Warren Gordon, 47 Bromfield street. All communications will be considered strictly confidential. By order executive committee, Massachusetts Anglers' Association."

The practice thus begun has been followed ever since.

But our work has not been confined to securing and enforcing laws and disseminating information. In 1890 we decided to enlarge our sphere of action, and at that time commenced the work of introducing into the Commonwealth new species and varieties of game birds, and thus far we have purchased and set free in various localities in the State more than 4,000 birds, consisting of pinnated grouse, sharp-tail grouse, and southern and western quail. In going over our records, I have been more and more surprised to see how closely our aims and purposes have been intertwined with the policy of the Commonwealth.

In securing advanced positions our Association has always been found in the first ranks, and there I am sure it will always be found as long as it has an existence. For the future our prospects are bright. We close the first quarter of a century of our existence with an increasing membership, a full treasury and plenty of work before us. Let those who shall round out the next quarter of a century show a record as much better as they can.

President Wiggin proposed the health of President McKinley, which was drank with all the honors, and Collector Lyman followed with a brief speech. President Smith, of the Senate, spoke for the Commonwealth, and Judge Barker made a capital speech from the sportsman's standpoint; he commented on the work of the association in the matter of fish and game protection. Col. Rockwell briefly referred to the work of the Association and proposed a sentiment to the memory of ex-Gov. Robinson, one of its staunchest friends. A letter was read from Gov. Rollins, of New Hampshire, regretting his inability to be present, and then the Rev. Dr. Little made a speech that placed him in the same class with the clergymen who have been guests in former years—gentlemen of the cloth who enjoy a day in the woods and on the streams and know how to describe the pleasures thereof. Commissioner Carleton congratulated the Association upon the work it had accomplished and said that the Maine Association had never asked for a law relating to fish and game that was not granted by the Legislature. There was one very important matter he wished to bring to the attention of the Massachusetts Association, and that was the urgent necessity for a law to prevent the sale in Massachusetts of deer, moose and caribou killed illegally in the State of Maine. That was a crying evil, and one that should be summarily stopped. President McLeod said the Megantic Club and the Massachusetts Association had much in common and should, as they no doubt would, work together in harmony for the common cause. Ex-President Clark brought the exercises to a close with a short, snappy speech, urging renewed energy for fish and game protection.

WM. B. SMART.

The Laurentian Club.

THE first annual dinner of the Laurentian Club was held at the Holland House, on Friday last, some sixty members of the club participating therein. Three of the club guides from the St. Maurice district of Canada were brought in after dinner had been served, and enlivened the proceedings by giving a number of French-Canadian songs. The unavoidable absence of Dr. W. H. Drummond, a member of the club, and a talented author of "The Habitant" and other poems, was much regretted. Mr. W. H. Parker, managing director of the club, was present from Lac la Pêche, and so was Mr. E. T. D. Chambers, of Quebec, who responded to a toast in the absence of Hon. S. N. Parent and Mr. L. Y. Joncas, and was invited to talk about his favorite fish, the ouananiche. Capital speeches were made by Dr. Huntington, by Mr. Justus Coles and others, but for that poetic diction so characteristic of the best literature of angling, the opening speech of the President, Mr. Joseph W. Howe, was the piece de resistance. In part, Mr. Howe said:

Gentlemen of the Laurentian Club and Brother Anglers: It is my privilege and my very pleasant duty to bid you welcome, and to say thrice welcome to those who have come down from the Laurentian land—the club house—the happy fishing ground.

This is a notable occasion, it being the first dinner of the club. We have had many "meets" at the club grounds, as the sportsmen say, but no meetings. It is our first general gathering.

For the first time we have the opportunity to see that expert as the members are in casting flies, "there are no flies on the members."

I shall not occupy your time by trolling a long line of remarks. Others will follow me, and I am sure the click of their verbal reels will be sweet music to your ears.

I should be glad if I could transport you in imagination to-night to the club itself—to the charming Lac

la Pêche and its spacious hall, with the huge granite chimney and the wide, hospitable fireplace, heaped with the blazing hemlock logs, whose crackling is, as Thoreau says, "like mustard to the ear"; to the beautiful Cing, nestling in its amphitheater, of mountains; across the forest trail to the wild, swift Mattawan; up the rocky gorge of the Castor Noir, to quiet Lac Dunbar, and its cabin, standing lonely on its shelf of sand; up to the Grand Castor Noir Lake, with its many green-wooded islands—the gem of the wilderness—to the Wessoneau, with its rushing streams and its lakes, its picturesque scenery, and then down the lordly St. Maurice. But it is not given to man to adequately describe the beauties of the Laurentian scenery in prose—at least not to me. In poetry our own Dr. Drummond has charmed us with his descriptions.

You will naturally expect me to speak of the club, but in doing that you must excuse me from telling "fish stories." For eleven consecutive summers I have visited the club. After my first visits I used to tell my experiences in my enthusiasm for the new found sportsman's paradise to my friends and acquaintances in the city, but I soon learned by visible signs that I was imperilling my reputation for veracity. To-night I shall confine myself to facts, especially as I see before me many fishermen who could always give me odds in the line of "fish stories."

I can say without fear of contradiction that the club is a marvel among clubs. It sprang into existence in the year 1886 under a charter from the Government of the Province of Quebec.

The original idea was evolved from the brain of Mr. William H. Parker. He went through the country and had the good judgment to select the best location for such a club. His associates were gentlemen of the best Canadian stock. When they had secured their franchise, they were generous enough and hospitable enough, and I may say wise enough to open their arms and hearts to us of the States, and receive us to the enjoyment and the development of the chartered privileges. As you know, our lease covers the waters, with riparian rights. Sometimes the question is asked: How many acres are covered by the lease? I do not know—the land has never been surveyed, but in that forest-clad country land is computed in square miles. How many lakes are there? I do not know. Scattered among the hills in the forests, only the loons and wild ducks and the great birds that soar toward the clouds can see them all.

The club so carefully enforces the fishing laws of the Province that the lakes will continue to be prolific of fish. The country is a land of lakes, rivers, forests and mountains; still in its primeval wildness and rugged beauty, with a soft summer climate, a land tempting to the sportsman, the lover of nature unsubdued, and the tired worker of civilization.

We have a right to boast of the character of our membership. We have had the choice of the best club material in Canada, and in twelve States of the Union. Beside our camp-fires sit members, representative men, from Quebec, Three Rivers, Montreal, Toronto, Knowlton; from Houston and Dallas, in Texas; from St. Louis, Columbus, Washington, Baltimore, Philadelphia, Newark, Paterson, New York, Bridgeport, Waterbury, Hartford, Stockbridge, Troy, Burlington, Providence, Boston, Cambridge, and many other scarcely less important places. The membership comprises business men, merchants, editors, publishers, engineers, bankers, brokers, clergymen, physicians, lawyers. Our rolls show the names of seven clergymen, twenty-one physicians, and some twenty lawyers.

The social life of the club accords with the character of its members.

Thus established, we foresee a prosperous future. One of the happiest conditions of the club life is the perfect unanimity of feeling existing between the members living north and those living south of the boundary line, between the two countries. At the business meetings, by the camp-fires, on the fishing grounds, there is no Canadian member—no member from the United States—all are Americans, all are harmonious, recognizing, first, always and only allegiance to the Laurentian Club, a happy augury we are glad to believe of the cordial relations henceforth and forever to exist between the Dominion and the Union.

Among those present at the dinner were: Joseph W. Howe, of New York, president of the club; W. H. Parker, of Lac la Pêche, the managing director; Mr. E. T. D. Chambers, of Quebec; David B. Cowles and H. R. Wooster, directors; Dr. Geo. S. Huntington, Professor of Anatomy at Columbia College; Dr. L. R. Morris; F. H. Gibbens, treasurer of the Del. & Lac. R. R. Co.; Col. W. C. Church, editor of the Army and Navy Gazette; Richard Butler; S. P. Avery; Joseph E. Gray, F. C. Wagner, Jos. Bushnell, Chas. P. Frame, Justus Cowles, C. F. Ludington, Edwin W. Coggeshall, Jas. W. Cromwell, Robt. D. Farlee, A. E. Hart, of Hartford; Edw. Holbrook, Jos. P. Howe, W. H. Kenyon, Jas. McCutcheon, L. A. Berin.

The Pennsylvania Law.

THE regular monthly meeting of the Pennsylvania Fish Protective Association was held at the rooms, 1020 Arch street, Philadelphia, on Saturday evening, March 11, and was largely attended. Many matters of importance to the fish and game interests were considered and acted upon. Messrs. M. G. Sellers, J. R. Sypher and William H. Burkhardt were appointed a delegation to attend a public meeting to be held in Hatboro, Pa., March 17, to advise and assist in the formation of a fish and game protective association at that place.

The Legislative Committee presented a lengthy report and announced having appeared before the Fish and Game Committee of the House in behalf of bills Nos. 220 and 227, which were favorably considered.

Bill No. 227 aims to codify and amend the various acts now on the statute books; to strengthen those which are weak; to correct palpable injustices both to the angling and commercial fisheries interests which now admittedly exist; to strengthen and make more understandable certain acts now notoriously obscure, and to so protect the fish that there will be a greater abundance for the use of the people. As a whole the act is much more liberal in

its provisions than the existing laws, because additional devices for catching fish, both game and food, are permitted, and because in several instances penalties have been reduced where before they were oppressive. In granting additional devices, for commercial fishermen, the Fish Commission has conceded as much as it is possible to do without working serious injury to the future of the fisheries interests. Many commercial fishermen on the chief streams of the State freely concede this, and are satisfied to have the bill become a law as it is drawn. As long as the present minimum limit of 6 in. bass and 5 in. trout is retained, it will be impossible to markedly increase the supply of same in the waters of this commonwealth, as every fish should be permitted to spawn at least once before being caught and killed. Section 17 is inserted with great reluctance by the Fish Commission, for the members believe the fish basket to be a device of greater destructiveness to fish life than any other, except explosives and poisonous substances. It was inserted as a compromise and after repeated conferences with residents on the Susquehanna, who demand the privilege of using it. These have all agreed to the provisions as set forth, including the amount of license named. Should there be any modifications to the section it would be a great misfortune to the State, for the provisions named are as much as can be granted with the least danger to the fishing interests.

House bill No. 220 is a measure designed to retain to the public for angling purposes, such private waters of the State as have not as yet come within the drag-net of control by private corporations for fishing purposes to the total exclusiveness of the public, and tends to break up an unpopular practice, which has closed most all of the "best" waters of the State. This measure appeals to the support of sportsmen and others in that it enlarges the water area for free angling recreation, deals fairly with the land owner, adjusts the annoying and constant recurring differences arising over trespass, permits the State to liberally stock such waters and by prohibiting fishing in the small rivulets or tributaries creates a nursery for annually rearing a supply of mature fish which in turn admits of a reasonable possibility of bringing the main waters up to a standard affording good fishing to all thereby keeping within the borders of the State a vast sum of money which from the constant increasing tendency to lease by private corporations is driven away.

House Bill No. 26, if passed, would create an effective warden service for the enforcement of all statutes governing the fish, game and forestry interests.

The unfortunate loss of trout fry at the Allentown Station was discussed at length, and the Executive Committee instructed to communicate with all applicants accordingly.

Attention is also called to a bill introduced in the House to repeal the act of March 24, 1868, which declared Hyners Run, a tributary of the West Branch of the Susquehanna, in the county of Clinton, a navigable stream for the distance of eight miles up from its mouth. The object of this bill is the first step toward closing this stream to the public and prompt steps should be taken to defeat its passage. Being a public stream, the Fish Commission have not hesitated to furnish fry for the same, and it should be maintained as a public stream for all time.

M. G. SELLERS, Sec'y.

HATBORO, Pa.—A large number of sportsmen of this place assembled at the town hall on Friday evening, March 17, at 8 o'clock, in response to a call issued by Mr. R. G. Fretz, to discuss the subject of fish and game, and take such action as will improve the existing conditions of these several interests in this section. Messrs. M. G. Sellers, J. R. Sypher and Wm. H. Burkhardt, representing the Pennsylvania Fish Protective Association, were present, each addressing the meeting at length upon the benefits to be derived from such action, and the value of organization to bring about the results desired. Addresses were also made by E. E. Shelly, R. G. Fretz and R. Hockman. The discussion was of great practical value to all and evinced a strong desire to more thoroughly protect fish and game in this vicinity. Organization was then effected under the title of The Hatboro Fish and Game Protective Association, and the following officers elected: President, E. E. Shelly; Vice-President, R. G. Fretz; Treasurer, R. Hockman; Secretary, H. Watson. A committee was appointed to draft a constitution and by-laws, and it is the purpose of the organization to procure a charter and the appointment of a warden. Application will be made for membership in the State Fish Protective Association, the delegates from which were accorded a vote of thanks for their instructions and assistance.

M. G. S.

THE PENNSYLVANIA FISH PROTECTIVE ASSOCIATION, Philadelphia, March 20.—We respectfully call attention to the following bills now pending in the Legislature, and would ask that your association take prompt action concerning the same, urging your Senator and Representative to work and vote for their passage.

1. House Bill No. 22.—An act to prevent the pollution of the water supply of municipalities.

2. House Bill No. 26.—An act making constables of townships and boroughs ex-officio fish, game and fire wardens, etc.

3. House Bill No. 220.—An act for the encouragement of fishculture. This bill has the endorsement of the Fish Commissioners.

4. House Bill No. 227.—An act to declare the fish that are game fish and fish commercially valuable for food, to regulate the catching, encourage the propagation of the same, etc. This bill has been prepared under the auspices of the Fish Commissioners, and it should be passed without material amendment.

The following bills should be defeated; please take action accordingly:

1. House Bill No. 99.—An act making it lawful to use fish baskets or fish pots, set nets or outlines. This act, if passed, would work incalculable injury to the fishery interests of this State, both as regards game and food fish.

2. Senate Bill No. 61.—An act amending the game law of 1897. The game law of 1897 is, we believe, entirely satisfactory and should stand as it is.

By order of the Association.

HOWARD A. CHAN,
Chairman of Executive and Legislative Committees.
M. G. SELLERS, Sec'y.

A Vermont Fish Lecture.

COMMISSIONER JOHN W. TITCOMB, of Vermont, gave a lecture on fishculture before the farmers of Wheelock and West Waterford the other day.

After reviewing briefly the early history of the fishes of Vermont by illustrating that a little over 100 years ago the shad were abundant in the Connecticut as far as Bellows Falls, and the salmon ascended the Connecticut and its tributaries to their sources, the cause of the depletion in these waters and of other waters of the State were briefly mentioned and then the work of propagation of the trout and salmon was illustrated by the use of the stereopticon, views being thrown upon a large canvas. These views illustrated the collection of the wild trout on their spawning beds, the actual work of stripping the fish and fertilizing the eggs, the various stages of the eggs laid down in the hatching troughs and the stages of development of the little fish after the eggs had hatched.

After briefly illustrating the work of trout propagation as carried on in Vermont, views of hatcheries and practical work of collecting fish and eggs of other fresh waters of the United States and also of various marine species was illustrated by views thrown on the canvas. It seems a stupendous task, for instance, to attempt to stock the coastal waters of the Atlantic Ocean with cod-fish by artificial propagation, but this work is being carried on to-day by the United States Fish Commission. With the improved methods of fishing and the increased number of fishermen, the cod had been practically exterminated from the waters along the Massachusetts coast and fishermen had been penetrating further and further to the Grand Banks every year. With the work of artificial propagation, the cod are reappearing in the bays along the Massachusetts coast.

Some very interesting views of the work of taking the Columbia River salmon of the Pacific Coast were also given.

It appears that there was once a time in Vermont and Connecticut when "shad were a penny apiece," and the hired man stipulated in his contract that he should not be fed salmon more than a certain number of times per week.

Nearly all the ponds of Vermont were originally inhabited by trout. These fish have been exterminated by the introduction of bass and pickerel. In many instances the waters were entirely unsuited to the introduction of the coarser varieties of fish, and, after the introduced bass or pickerel had exterminated the trout, they were unable to obtain sufficient food to sustain themselves, and, as a result, we have in some waters a long, slim and almost useless pickerel, and in some ponds bass which should grow to weigh 4 or 5 lbs., but which do not attain a weight of 1 lb.

The work of the State hatchery was reviewed, in which Mr. Titcomb stated that the commissioners had hoped to be able to begin the distribution of fingerlings instead of fry, and make plants of fish in the public waters of the State in the fall of the year, instead of in the spring. With the curtailed appropriation made by the last Legislature, this work will be practically impossible.

The talk was illustrated by about sixty-five views, most of them on the practical subject of fishculture in its various branches, but some of them contained some very fine natural scenery.

The enemies to the propagation of fish were described showing how eggs naturally deposited by the parent fish are not only eaten by other fish, but by insect larvae, and, as a result, a very small percentage of the eggs naturally deposited ever come to maturity, while by artificial propagation from 90 per cent. to 95 per cent. of the eggs are fertilized and hatched for distribution. A trout weighing 1 lb., for instance, yields about 1,000 eggs. If she deposits these eggs naturally, only a small percentage will be fertilized, and of that small percentage many will be eaten by insect larvae and by other fishes. Perhaps four or five fish, or even a larger number may mature from spawn thus naturally deposited. By artificial propagation these same eggs are taken from the parent fish, and out of 1,000 eggs 900 little fishes can be distributed after they have arrived at an age when they can feed and take care of themselves.

The importance of the fisheries of the United States was illustrated by the fact that about 1,000,000 men, women and children are employed in connection with the fisheries or products of the fisheries, and the annual product of the fisheries is valued at \$50,000,000.

Mr. Titcomb advocated protective laws well enforced and stated that protective laws could not be well enforced unless public sentiment is back of them. In addition to protecting the fish during their spawning seasons, the only method of restoring our waters to their primitive condition or to even approach this condition is by artificial propagation extensively carried on. Vermont is appropriating less than any other New England State for this kind of work. New Hampshire maintains eleven hatcheries and Maine also supports a large number of hatcheries and appropriates liberally for the work of fish and game propagation and protection. As a result of this work, the State of Maine estimates her receipts from that portion of the summer visitors who come purely for hunting and fishing as something like \$4,000,000, and New Hampshire estimates her income from the same sources at about \$1,000,000.

CHICAGO AND THE WEST.

CHICAGO, March 16.—A correspondent of this city writes of the edible qualities of some fish as follows:

Last week Mr. Fred Mather wrote about coot and the eating of them. I have eaten coot or mud hens over in Michigan in the fall of the year. If they are first skinned and then cooked, the same as a duck, they are not bad eating.

I have never tried to eat the sheephead (fresh-water drum) of the Great Lakes, but I am told by those who have tried them that they are tough and flavorless. I think it is this fish that is called in the Ohio Valley the white perch, which is used as a food fish by some of the people in that part of the country, who do not find the same objection to it that is found to the sheephead of the Great Lakes. Difference in the conditions under which

fish live and the character of the water sometimes make quite a difference in the flavor of them. At certain seasons of the year there are caught at the falls of the Ohio River at Louisville, Ky., wall-eyed pike (pike perch) of say 6 to 15 in. in length. These fish are locally designated as jack salmon, and are popularly supposed to be a distinct kind of fish that are only found at or near these falls. As a matter of fact, they are found in nearly all of the tributary streams of the Ohio. I have caught them in the Rockcastle (which is a tributary of the Cumberland River), where they seem to have a golden sheen on their scales when they come out of the water, and are called, locally, "golden salmon." However, the Ohio Falls jack salmon, of length named above, are mighty good eating when freshly caught and fried, with the addition of a little lemon juice or tartar sauce when served. They are of delicate flavor, and better than the same fish in the North. The large "wall-eyes" of the Ohio Valley are usually called white salmon, and are supposed by many to be a different fish from the jack salmon. Wall-eyes from the Maumee are designated as Maumee salmon, at Louisville, and are not considered, by the local epicures, as good as the genuine jack salmon. Probably black bass are better eating if they are skinned before cooking, especially in the spring of the year. For some reason the skin of the bass, frequently in the spring, has a rank flavor, which is imparted to the fish when cooked with the skin on. Dogfish or Johnny Grindles are eaten by many of the negroes of the South.

A party of my acquaintance tried to eat garfish once when out on a fishing trip, but told me he did not "hanker" after any more of it. In the interior of Kentucky many of the country people prefer the mud cat-fish to any other fish found in their waters, for the reason that it tastes sweeter. I don't know that the "mud-cat" is any greater scavenger than the lobster or than chickens, still I would prefer either of the last two.

I notice in the FOREST AND STREAM of this week an inquiry about fresh-water turtles. There are large numbers of turtles in all of the streams of southern Michigan that I have any knowledge of, but I have never seen any of them in the trout streams in the northern part of the State. I do not know the proper name for these turtles. They are clean looking, and are caught for the market during the summer months by men who make a business of it. They are shipped alive, in stout sacks, to New York and Chicago, where I suspect they appear under the guise of "Terrapin a la Maryland" and "Green Turtle Soup" at various hotels and restaurants. I have seen these turtles on sale in Chicago. If you float any great distance on some of the streams of southern Michigan in the summertime you will see many turtles out on logs and on trees that overhang the water. They vary in size from quite small up to some old settlers that look as if they would weigh 15 to 20 lbs. The large ones, when disturbed, will slip off of a log into the water so quietly and easily as hardly to leave a ripple on the surface.

Then turtles are usually caught by the market-hunters in traps and in nets. The nets are short and seem to be made of coarse cotton cord. I do not know just how they use them. The traps look something like short fyke nets with a piece of meat fixed inside for bait. I have seen many of these traps set in rather shallow water in rivers, but never made any special examination of them. I have been told that a turtle was caught in the Kalamazoo River near Galesburg, Mich., some years ago that weighed 80 lbs.

Last August, while fly-fishing for trout on the Middle Branch of the Pere Marquette in Michigan, I caught several speckled trout during a thunderstorm; and I have been told that this is something unusual. Kit Clark, in one of his books, says something like this (quoting from memory), "When a shower comes up you may as well quit fishing (i. e., fly-fishing) for trout."

The Kennel.

Postponed.

Charles E. Baer, in Philadelphia Press.

Come along, old chap, yer time's 'bout up,
We got another brindle pup;
I 'lows it's tough an' mighty hard,
But a toothless dog's no good on guard,
So trot along right after me,
An' I'll put yeh out o' yeh misery.

Now, quit yer waggin' that stumpy tail—
We ain't a-goin' fer rabbit er quail;
'Sides, you couldn't p'int a bird na more,
Yer old an' blind an' stiff an' sore,
An' that's why I loaded the gun to-day—
Yer a-gittin' cross an' in the way.

I been thinkin' it over; 'tain't no fun,
I don't like to do it, but it's got to be done;
Got sort of a notion, you know, too,
The kind of a job we're goin' to do;
Else why would yeh hang back that-a-way?
Yeh ain't ez young ez yeh once wuz, hey?

Frisky dog in them days, I note,
When yeh nailed the sneak thief by the throat;
Can't do that now, an' there ain't no need
A-keepin' a dog that don't earn his feed,
So yeh got to make way fer the brindle pup;
Come along, old chap, your time's 'bout up.

We'll travel along at an easy jog—
Course, you don't know, bein' only a dog;
But I can mind when you wuz sprier,
'Wakin' us up when the barn caught fire—
It don't seem possible, yet I know
That wuz close onto fifteen year ago.

My! but yer hair wuz long an' thick,
When yeh pulled little Sally out o' the crick;
An' it came in handy that night in the storm,
We coddled to keep each other warm.
Purty good dog, I'll admit—but say,
What's the use o' talkin', yeh had yer day.

I'm hopin' the children won't hear the crack,
Er what'll I say when I git back?
They'd be askin' questions, I know their talk,
An' I'd have to lie 'bout a chicken hawk;
But the sound won't carry beyond this hill;
All done in a minute—don't bark, stand still!

There, that'll do; steady, quit lickin' my hand,
What's wrong with this gun, I can't understand;
I'm jest as shaky ez I can be—
Must be the age's the matter with me.
An' that stich in the back—what! gittin' old, too?
The—dinner—hell's—ringin'—fer—me—an'—you.

Exposition Rifle Tournament.

The scores made in the rifle competition at Madison Square Garden from March 2 to 15 are as follows:

The conditions of the individual championship match were: Open to all, 100 shots offhand, 25-ring target, distance, 100ft.; any .22cal. rim-fire allowed. Entrance \$5, including season ticket to Sportsmen's show. Only one entry allowed to each competitor. Competitors shot their ten strings as they desired. Prizes: First, championship trophy and \$20; second, \$25; third, \$20; fourth, \$15; fifth, \$12; sixth, \$10; seventh, \$8; eighth, \$8; ninth, \$6; tenth, \$6; eleventh, \$5; twelfth, \$5.

F. C. Ross 2425, L. P. Ittel 2417, H. M. Pope 2413, L. Buss 2412, L. Flach 2409, G. Dorr 2403, R. I. Young 2391, W. A. Tewas 2390, Dr. W. G. Hudson 2389, G. Schlicht 2386, H. Holges 2386, Dr. A. A. Stillman 2382.

Premiums: G. Zimmermann 363, H. M. Pope 367, L. Buss 364.

The continuous match was open to all, off-hand, on 25-ring target, 100ft. distance, any .22cal. rim-fire allowed; entrance for ticket of three shots 50 cents, re-entries unlimited, but only one prize can be won by any one shooter. Two best tickets to count for prizes. Prizes: First, \$50; second, \$35; third, \$25; fourth, \$20; fifth, \$15; sixth, \$12; seventh, \$10; eighth, \$10; ninth, \$9; tenth, \$8; eleventh, \$8; twelfth \$8; thirteenth, \$7; fourteenth, \$7; fifteenth, \$7;

Rifle Range and Gallery.

Sportsmen's Exposition.

Revolver and Pistol Matches.

THE scores made in the different competitions with pistol and revolver at the Sportsmen's Exposition were as follows:

Match A—Any Revolver Championship.—Prizes: First trophy, value \$50; second, \$25; third, \$15; fourth, \$10; fifth, \$8.

Arms.—Any revolver not over .45cal., with barrel not over 7 1/2 in. exclusive of cylinder.

Sights must be strictly open. Trigger pull shall not be less than 2 1/2 lbs. Number of shots: This match calls for five 6-shot targets, a target to consist of six consecutive shots. Targets: Standard American, 2 3/4 in. bull. Cleaning allowed between scores. Ammunition: Any ammunition allowed. Entrance fee for this match is \$3. Distance, 20 measured yards. Ties will be decided by draw. Re-entries allowed; five targets for \$1, or 25 cents each.

IN NEW JERSEY.

The Oakley Handicap.

March 16.—The Oakley handicap, at 25 live birds, \$10 entrance, handicaps 25 to 33yds., took place at Elkwood Park to-day. There were eight entries. The trophy, a beautiful cup, presented by Miss Annie Oakley, was won by Mr. Phil Daly, Jr., on a score of 23, a most excellent performance, considering that his gun jarred off twice, his 5th and 11th shots, and that he was therefore disturbed by it in his shooting. Lewis was unfortunate in having his safety slip back on his 13th bird, which escaped in consequence, without being shot at. He made the excellent score of 22 nevertheless. Elliott's 3d was a hoverer, which jumped up and down instantly to the ground. His 5th was a corking fast bird. Ivins had a misfire on his 3d, and got his next bird neatly. Quimby undershot his 24th with both barrels, a fast left-quartering incomer. Wood, who stood at 26yds., shot some of his birds very accurately and neatly, and promises to be a man who should stand down at about 28yds.

There was a stiff, strong northwest wind, which blew steadily and made the birds from Nos. 1 and 2 traps exceedingly difficult. Mr. Harold Wallack acted as referee.

Hackensack River Gun Club.

Hoboken, N. J., March 18.—Herewith are the scores of the Hackensack River Gun Club. The shoot was on March 17. Through an oversight of the sporting editor one score and following article was left out. I send you a few lines, and you can use them as you see fit.

After the shoot was over for the day all those who took part and their friends were entertained to a very fine supper and refreshments at the club's expense. Messrs. Schortemeier, Ch. Steffens, C. F. Lenone and the writer made some very good speeches. Mr. Herman Stude played the violin, while Miss Staude, Mrs. Heffich and Mr. Wm. Clark sang some very pretty pieces. Mr. John Smith also entertained the crowd with his comical songs and buck dancing. After several hours of merrymaking, all those present congratulated the secretary for the great success of the whole affair, and all hoped to be present at the next shoot.

GEO. LATTEMANN, JR.

The Grand American Handicap.

NEW YORK, March 18.—*Editor Forest and Stream:* By the time this reaches the eyes of the shooting public only a very short time will remain before the date for closing regular entries in the Grand American Handicap of 1899 will arrive. Will you, therefore, permit me to call the attention of all intending contestants who have not yet forwarded to me their forfeit of \$10, that regular entries close on Tuesday, April 4. Penalty entries may be made at any time after April 4 until the last man has shot at his second bird, on payment of an extra fee of \$10.

Admission badges will not be mailed before March 25 at the earliest. (This is in answer to numerous inquiries.)

From present indications, and judging from the number of entries received to date, the Grand American Handicap of 1899 is going to assume considerably larger proportions than even the great event of last year, which had a total of 207 entries.

EDWARD BANKS,

Secretary-Treasurer.

ON LONG ISLAND.

Emerald Gun Club.

The handicaps of the Emerald Gun Club are after the manner of the point system, and for 1899 are as follows:

Class AAA, 29yds., 7 points: L. H. Schortemeier, J. S. S. Remsen, Gus Greiff, E. J. Clark, Dr. G. V. Hudson, E. A. Vroom, S. M. Van Allen, Wm. A. Sands, E. Helgains, W. Fred Quimby.

Class A, 28yds., 6½ points: G. B. Hillers, H. P. Fessenden, Wm. Cotton, B. H. Norton.

Class A, 28yds., 6 points: C. W. Billings, Wm. Joerger, J. Woelfel, B. Amend, E. O. Weis, O. Hilmer, J. Pillion, Capt. J. A. H. Dressell, U. M. C. Thomas, J. H. Swan.

Class AA, 28yds., 7 points: Tom Short, Dr. E. Rugle, J. Rathgen, Tod Sloane.

Class B, 25yds., 6 points: W. J. Amend, C. Stutzle, R. Regan, J. Banzer.

Class B, 25yds., 5½ points: G. K. Breit, Dr. J. H. O'Donohue, J. Mohrman, F. Ellerhorst, J. Hogan, R. Roberts.

Class B, 25yds., 5 points: T. Coady, J. Gallion, Dr. H. M. Groule, C. W. BILLINGS.

Brooklyn Gun Club.

Brooklyn, L. I., March 20.—The fourth and last shoot for the Marshall trophy was won by Dr. Douglas, he having won it three times. No. 5 was the cup contest:

Events:	1 2 3 4 5 6 7 8 9 10	Targets:	10 15 10 15 25 15 25 15 25
Douglas	7 10 7 8 18 10 15 18 14 23	Kemble	7 12 7 10 17 12 .. 13 12 16
Cremer	4 8 3 .. 18 6 .. 8 .. 18	Wright	7 5 11 15 8 12 .. 10 ..
Paterson 19	Van Sise 4 7
Jarvis 4 .. 5	In No. 5, Douglas and Kemble had 6 each added.	

GEO. B. PATERSON, Sec'y.

Oceanic Gun Club.

Rockaway Park.—The regular semi-monthly shoot of the Oceanic Rod and Gun Club was held on the first day of this week at its grounds, at Rockaway Park, L. I., between the showers and a gale which blew 72 miles an hour:

Events:	1 2 3 4	Targets:	25 25 15 25
L H Bill	21 21 11 23	J Jones	11
A Scheubel	15 15 9 18	E Bourke	11
J Stoney	14 17 ..	F Coleman	11
T Diffley	12 9 ..	J. Jones.	

Cresson Gun Club.

ALTOONA, Pa., March 17.—*Editor Forest and Stream:* The new Cresson Gun Club, Cresson Springs, Pa., held their first shoot on St. Patrick's day. A delegation of some twenty-five shooters and spectators from Altoona, and contingents from a dozen other towns arrived on the morning trains. Everything was found in readiness, and the feast of target and live-bird shooting began at 9:30. The day was an ideal foretaste of spring. Sweet singing birds, and all nature did their best to make glad this famous mountain resort.

Among the crowd were S. B. King, of Spangler; Dr. S. M. Richards, Ebersburg; R. A. McNaught, Thomas Dipner and Thomas Hemphill, of Hollidaysburg; L. B. Blair and D. D. Stine, Tyrone; Justus Vogt, Charles Crouse and Robert Tosh, of South Fork; Samuel T. Howard, Williamsport; Capt. Craig and Col. Kerr, Pittsburg; O. C. Brown, Frugality; W. L. Sands, J. M. Dively, U. S. Houck, E. H. Murray, Chas. E. Rhoades, G. G. Zeth, John Schenck, John Keyes, J. S. Stier, C. L. Greek, J. H. Davison, W. W. Wilson, George Smith, Dr. F. M. Christy, L. Feeney, E. T. Drhew and Henry Doerr, of Altoona.

Eleven target and two live-bird events were shot. The Sergeant system and the new Interstate rules prevailed in target events. Five ground traps and revised Interstate rules in live-bird races. The background in both cases was an exceptionally hard one. A half-dozen shades of evergreen, and as many other effects kept the shooter constantly guessing. These conditions, we predict, the Cresson boys will overcome by and by, when they come to select a permanent location.

The live birds were a very fast lot, and very few required any urging to start. McNaught, Clover and Conrad drew the hardest flyers. Blair, of Tyrone, did nice work in winning first in the principal event, as did also Sands and Vogt in taking second place.

Mr. P. Abercrombie, superintendent of the Cambria & Clearfield division of the Pennsylvania Railroad, was present. Mr. Abercrombie is an old-time trap shot, having been formerly located at Williamsport, Pa., where he, Hughes, and Millsbaugh were very prominent in shooting circles. He has lost none of his love for the sport, although business prevents him from taking much part at tournaments.

The committee in charge consisted of C. Wendro'h, Chas. Conrad, J. B. Highberger and A. B. Earhart.

The scores:
 No. 1, 10 single targets: Clover 4, Houck 7, Sands 4, McNaught 8, Craig 2, Blair 5, Murray 4, Rhoades 5, Stine 3, Conrad 3, Richards 3, Kellerman 4, Freeman 5, Dively 5, Crouse 2.

No. 2, 10 single targets: Clover 6, Houck 4, Stine 5, Conrad 4, Kellerman 1, Sands 6, McNaught 7, Blair 4, Rhoades 6, Murray 6, Crouse 0, Meehan 6, Dively 6, Richards 3, Wenderoth 7.

No. 3, 10 single targets: Clover 7, Houck 5, Sands 6, McNaught 8, Rhoades 6, Shaw 6, Blair 4, Meehan 7, Murray 9, Howard 0, Kellerman 4, Charlton 2, Crouse 0, Richards 5, King 5.

No. 4, 10 single targets: Kerr 1, Craig 3, O'Brien 3, Richards 4, King 4.

No. 5, 10 single targets: Clover 8, Houck 5, Sands 5, McNaught 7, Rhoades 4, Kellerman 2, Murray 8, Howard 1, Brown 1, Tosh 2, Blair 8, Stine 8, Dively 8, Meehan 3, Highberger 4.

No. 6, 10 single targets: Charlton 4, Craig 1, Herr 1, Richards 3, King 5.

No. 7, 10 single targets: Clover 5, Houck 6, Sands 6, McNaught 9, Rhoades 6, Murray 7, Blair 7, Kellerman 1, Stine 6, Craig 5.

Event No. 8, live birds:		Crouse	020120*000-3
Clover	012102*01-5	Blair	1221201212-9
Houck	120102*11-6	Murray	1210*10210-6
Sands	1112121*10-8	Tosh	0021201021-6
McNaught	1001*0012-4	Howard	1020020100-4
Vogt	0121*11120-8		
Stine	110210*002-5		

Event No. 9, live birds:		Kellerman	01210-4
Charlton	00212-3	Conrad	*20*-2
Kerr	01201-3	Wenderoth	11112-5
Richards	12112-5	Meehan	12010-3
King	01210-3	O'Brien	11101-4
Craig	*1210-3		

No. 10, 10 single targets: Sands 8, Ferguson 5, McNaught 5, Dipner 6, Houck 3, Rhoades 6, Clover 7, Hemphill 3, Stine 7, Vogt 7, King 5, Wenderoth 2, Conrad 1, O'Brien 6, Meehan 6, Lees 1, Pfeister 3.

No. 11, 10 single targets: Sands 7, Ferguson 0, McNaught 8, Dipner 9, Clover 2, Stine 7, Voght 7.

No. 12, 10 single targets: Sands 5, Ferguson 5, McNaught 8, Dipner 3, Clover 7, Stine 8, Vogt 3, Conrad 4, Pfeister 4, Freeman 7, J. P. C. 1.

No. 13, 10 single targets: Sands 7, Ferguson 2, Clover 6, Stine 6, Voght 7, Meehan 3.

Auburn Gun Club.

AUBURN, Ind., March 11.—The Auburn Gun Club's first shoot of the season was held at the club grounds to-day. On account of wet grounds only a few of the members were present. Conditions, 25 traps, magautrap. The following are the scores:

Tarney	111111111111001011101011-20
Snvder	111011000111101010100010-14
Robbins	110010110111111100011111-18
A B Steele	111011111111111101111111-22
McClellan	0001010101010101010111-14
M A Steele	011111110101010101111111-20

M. A. SEELE.

A beautiful silver chocolate set and an equally beautiful silver tea set were first prizes in the roof target competition tournament. These Mr. Heikes will annex to his large collection of trophies, though he gravely asserts that he will place both sets in commission at once.

Sportsmen's Association Tournament.

THE scores of this tournament were all published in FOREST AND STREAM of last week, excepting those of the last day, Wednesday, March 15. As to the weather of the last day, it was all that was undesirable. There was a cold, persistent rain, a densely overcast sky, a strong wind, and in consequence targets which took sharply erratic flights were difficult to see. Starting where there was a comparative calm, when they reached an altitude where the wing caught them, they might fly true or take tricky turns, as the case might be.

Heikes and Elliott had tied on 85 in the continuous match, which was virtually a miss-and-out, with unlimited opportunities to re-enter. Heikes had made his greatest run, 85, on the second day, and Elliott tied it on the eighth day, he shooting in great form on that day, for in eight attempts he ran 85, 53, 11, 23, 37, 8 and 16, he aiming his Winchester gun with admirable precision. Thus on this day, out of 270 targets shot at, he missed but 7, truly a first-class performance in every particular. He also made 98 in the championship match on three different days—on the first, eighth and eleventh days. Heikes made his longest run, 85, on the second day, though he ran 79 on the fourth day, and a number of runs at different times of between 20 and 40.

A resume will tend to refresh the memory concerning the daily winners in this long race:

Continuous Match.	Association Championship.
March	
2. J J Hallowell.....33	J J Hallowell.....33
3. R O Heikes.....85	J A R Elliott.....28
4. I Tallman.....96	I Tallman.....96
5. R O Heikes.....93	R O Heikes.....93
6. R O Heikes.....79	R O Heikes.....98
7. R O Heikes.....88	R O Heikes.....93
8. Edw Banks.....93	R O Heikes.....93
9. J A R Elliott.....39	J J Hallowell.....39
10. J A R Elliott.....85	R O Heikes.....98
11. S M Van Allen.....97	S M Van Allen.....97
12. B Le Roy.....95	B Le Roy.....95
13. J A R Elliott.....52	J A R Elliott.....95
14. J A R Elliott.....78	J A R Elliott.....98

There were many other good scores, and the winners each day were pressed close for the honors.

Shoot for championship—Heikes and Elliott shoot off the tie for the continuous match in this event, Heikes winning.

Trap and Reading.

READING, Pa., March 13.—The Independent Gun Club, of Sink Spring, Pa., held a sweepstake shoot to-day at targets. The scores follow:

Events:	1 2 3 4 5 6 7 8 9 10 11 12 13 14
Targets:	10 10 15 10 10 10 10 10 10 10 10 10 10 10
Schaaber	8 9 12 7 8 8 9 8 9 10 5 13 ..
Spatz	9 10 11 8 .. 6 .. 7 .. 9 10
Wertz	9 8 15 9 10 10 10 9 10 9 6 11 ..
Coleman	7 8 12 9 5 10 9 8 8 9 8 15 10 ..
Gundy	6 .. 7 .. 6 6 6 5 .. 10 ..
Reed	4 .. 5 7 7 4 .. 4
Miller	8 .. 5 .. 6
Hainly	9 5
Huntzinger	6 6 .. 8 9
Young	7 9
Rittenhouse	5 6

Mahanoy City March 17.—The first of the series of three live-bird matches between Coldren, of Reading, and Cooper, of this city, was shot to-day on the ball grounds, and resulted in a victory for Cooper, he killing 23 out of 25 live birds shot at. Coldren killed only 21, but had 3 dead out of bounds, while Cooper had but one dead out of bounds. The match was at 25 live birds per man, Schuylkill county rules to govern. The second of the series will be shot at Reading at 50 live birds, Hurlingham rules. In the morning a handicap shoot was held, each man furnishing 11 birds, which were placed in one large crate. After being well mixed among one another, the birds were then trapped. Three traps were used, Schuylkill county rules, and the match was won by Miller, of Mahanoy City, with a score of 10 killed out of 11. Fully 800 people witnessed both matches, and Miller was awarded \$200, the gate receipts, as first prize.

DUSTER.

Centerdale Gun Club.

CENTERDALE, R. I., March

Montgomery Ward & Co. Medal Contest.

CHICAGO, Ill.—The third contest for the Montgomery Ward & Co. medal took place at Watson's Park, on Friday, March 17. There was not as large an attendance as usual on account of the disagreeable weather, and because many of the shooters were absent in the marsh after ducks. Some excellent shooting was done, and Mr. Sturtevant was successful in carrying off, for the time, both medals, the diamond and the high average. Some brilliant shooting was done by Messrs. Sturtevant, White, Steck and O'Brien. The shooting of Mr. Sturtevant was as fine as has been seen at Watson's Park for many a day, indeed the writer has never seen any finer. The birds were good strong flyers. Mr. Sturtevant stood at 27 yds., shot a 16-gauge Parker, loaded with 2 3/4 drs. Du Pont. Smokeless and a scant ounce of No. 7 shot. In the medal contest he killed 15 out of 16 birds, being the only one who scored the possible 15. He also made the greatest number of consecutive kills, which gave him the high average medal for the time. Afterward in sweepstake shooting he killed 24 out of 24, with the last bird dead out of bounds. There was a 9 o'clock wind.

There was considerable good-natured chaffing between Messrs. Sturtevant, Dr. Shaw and Leffingwell about Sturtevant using a 16-gauge gun. Sturtevant said he was going to try it, as he had been successful with it in the field, and Messrs. Shaw and Leffingwell said that inasmuch as he was such a good shot that he should stick to the 12-gauge he had been used to shooting. The advice given to Sturtevant by Leffingwell did not seem to work both ways, for what he intended to warm Sturtevant against he did himself by lengthening the stock of his gun by putting on a thick rubber butt, and the result was that he was clearly out of form, and made about the poorest score of any one. After the medal shoot he removed the butt plate and shot comparatively as well as the rest.

Among the out-of-town visitors who attended the shoot were Messrs. Fred Gilbert, of Spirit Lake, Ia.; and Mr. McKay, of Minneapolis. Gilbert used a Winchester repeating shotgun with great effect. Indeed, it seemed as if Rolla Heikes were standing at the score and pumping it into them, so rapidly did Gilbert work the gun.

The next contest for the medal will be held on March 31, and no shoot will be given on the first Friday in April, the regular day. The reason for the change is that many shooters in Chicago and vicinity wish to go to the Grand American Handicap at Elkwood Park, and if the shoot was held on the first Friday of April, it would interfere with many attending.

J. L. White won the second prize, and Mr. Shields the third. The scores:

E S Rice, 28.....	*112*0112022211	01	—12

The day was very bad for shooting; the wind was from left to right across the traps, making the birds mostly right-quarterers. A light rain fell until about 3 o'clock, and from then until the close it came down hard. The day was dark, making it very hard to see a dark bird over the dark grounds. F. McKay, the expert from St. Paul, was present. Sturtevant was boss of the locals. X.

Boston Gun Club.

WELLINGTON, Mass., March 17.—The third last shoot of the Boston Gun Club was favored with miserable weather, yet ten enthusiasts graced the platform March 15, as if nothing was the matter. The poor light, the execrable wind, the cold dampness and the hard targets all came in for a share of bitter criticism to be sure, but not one of the ten would have missed the fun, even had the light been poorer still and the wind much more joyous. Toward the close of the afternoon a sharp snow and hail squall turned loose on the shooters, and to the general discomfort was added the pleasure of biting particles driven in one's face while trying to aim along 30in. of gun barrel.

Small wonder that the shooter saw double or saw not at all, and that more misses than credits fell to the lot of a few. Mr. Woodruff very satisfactorily maintained an average pace; everybody else sadly fractured their averages. Mr. Griffiths, from Providence, R. I., successfully negotiated the leading prize score, though seeking good company in balance of events.

Scores as follows:	
Events:	1 2 3 4 5 6 7 8 9 10 11 12 13
Targets:	10 10 6 10 10 5 6 10 10 10 10 10 10

There will be an all-day shoot under the auspices of the Boiling Springs Gun Club on Saturday of this week, shooting to begin at 9:30 A. M. Dinner will be served at the expense of the club.

Eureka Gun Club.

WATSON'S PARK, Chicago, March 18.—The Eureka Gun Club finished their series of nine shoots to-day in very bad weather, the wind blowing straight out and from the north; traps facing south. Each man had to shoot in six shoots to count, and his five best scores counted. There are three nice gold badges, one large one, for the best score; one a little smaller for second, and one still smaller for third. L. C. Willard won first, five best shoots, 15 birds each, 75, killed 71. E. M. Steck won second, five best shoots, 15 birds each, 75, killed 66. F. H. Lord won third, five best shoots, 15 birds each, 75, killed 65.

This is the last of the Eureka Gun Club's series of nine shoots:

Yachting.

As the yachting journal of America, the *FOREST AND STREAM* is the recognized medium of communication between the maker of yachtsmen's supplies and the yachting public. Its value for advertising has been demonstrated by patrons who have employed its columns continuously for years.

The Standard Navy Steam Cutter.

IN the paper on The Standard Navy Boats, by Arthur B. Cassidy, Esq., recently read before the Society of Naval Architects and Marine Engineers, as published in the *FOREST AND STREAM* of Dec. 17, 1898, mention is made of the steam cutter, built in five sizes, for tenders to the warships. These cutters are specially staunch and sturdy in design and construction, fitted for rough and hard service, with no pretensions to high speed and elegance of form; the 28ft. size is expected to make six knots in a sea, and the 40ft. size eight knots. The lines of these boats, practically identical for all sizes, are shown in the accompanying plans, the construction following next week. In view of the frequent demand for something abler and stronger than the average pleasure launch, they will probably be interesting to many of our readers. The details of these boats are as follows:

Principal Dimensions.				Weight	
Length, extreme.	Breadth, extreme.	Depth from top of deck to lower edge of rabbet.	Hull.	Total including outfit.	
Ft. In.	Ft. In.	Ft. In.	Lbs.	Lbs.	
40.00	9.00	4.7 1/2	8,064	18,642	
36.00	8.09	4.06	7,148	15,719	
33.00	8.07	4.05	5,120	12,768	
30.00	8.00	4.02	4,763	10,631	
28.00	7.08	4.00 3/4	3,692	8,889	
Maximum number of men boat will carry.	Weight of provisions and water.	Freeboard with maximum number of men and provisions.			
	Lbs.	Ft. In.			
60	600	1.09 3/4			
53	530	1.09 3/4			
48	480	1.09 3/4			
35	350	1.07 3/4

218.82	125.00	.207 aft.	11.77		
283.75	145.00	.27 aft.	12.64		

The boats are rigged as shown, with two standing lug sails, but of small area.

YACHTING NEWS NOTES.

The new catalogue of the Rochester Machine Tool Works for 1899 describes in detail the Acme Automatic Engine, a very compact and serviceable motor using kerosene for fuel. The stationary engine, of which the company manufactures several sizes, can be fired with kerosene or natural gas, as may be desired. The marine engine, made in sizes from one to seven horse-power, has its weights low and is well adapted for yachts and launches. The company makes a specialty of the Buck-

ley Patent Watertube Boiler, a sectional boiler of light weight, easily taken apart for transportation, or installation below decks, and fire with coal, wood or oil, as desired. One of these boilers has been doing excellent work during the past season in the steam yacht *Lucina*, of Syracuse, and many of them are in use in steam yachts and launches. Those who are interested in small power craft will find the catalogue worth their attention.

Yacht Designing.—XXVI.

BY W. P. STEPHENS.

(Continued from page 199, March, 11.)

THE selection of a suitable outfit of drafting instruments is quite an important matter, and one in which it is difficult to give advice, unless all the conditions of the case are known. A great deal of work may be accomplished with such a simple outfit as may be had for very little money; and on the other hand, if the intended use justifies it, quite a large sum may be expended at one time in the purchase of an outfit so complete as to make drawing a pleasure and to produce the best results in the least time. In the case of professional work this last consideration is a very important one, the value of a draftsman's time is so much greater than the cost of tools that it is good economy even in a small office to have the best and plenty of them.

All of the dealers keep sets of instruments already made up, in cases specially fitted for them, the prices ranging from \$5 for the simplest set of half a dozen instruments of good quality up to \$300 for every complete and elaborate outfits of instruments, scales, curves, colors, etc., in handsome cabinet. Where money is no object the choice of such a made-up set settles the question very quickly, but it is better, as well as more economical, to purchase the instruments singly, selecting each on its merits. In the made-up sets there will inevitably be many parts which are of little use for the particular work in hand; and the cabinets, however ingeniously arranged, are not the most convenient receptacles for selecting the instruments as needed and returning them quickly to their places. The best plan, especially for the novice, is to start with a few instruments, adding to the collection as fast as these are thoroughly understood and the necessity for others is apparent.

We will take first the case of the amateur and novice who wishes to try his hand at a design or so, but does not intend to follow the subject indefinitely as a pet hobby. He will presumably work at odd times amid such surroundings as are available, with no special conveniences for supporting the board, storing plans, etc. For such work it is well to limit the work to a drawing board 20 by 26in., which will take the size termed *royal* paper, 19 by 24in. There was a time when *Whatman's* was the one standard make of drawing paper, but now the draftsman has a wide range of choice among different makes and qualities. For study and practice work a good *detail* paper will answer, even where the drawing is to be inked in, at about one-half of the cost of the white papers; but, as stated in a previous chapter, it is usually good economy to buy first-class paper.

For the work now under consideration, and on a small board, a few thumb tacks will be needed to secure the paper to the board. Under the same conditions a *straight-edge* may be dispensed with, the *T square* taking its place. One with a fixed head and a 24in. blade will answer, the next size, 30in. blade, is longer than necessary for this size of board. The cheapest which it is worth while to buy will cost about 60 cents, a better grade, with blade edged with a hardwood, costs about 75 cents. The combination of fixed and shifting heads in one instruments is really less convenient than either one separately; the best perhaps being a single shifting head. This can be set approximately to a right angle and locked there, the lines drawn by it, though not quite at right angles to the edge of the board, being in correct relation to each other whether drawn from the left hand edge or the lower side. If it be necessary to replace an old drawing on the board, the shifting head can be so adjusted as to fit the base lines of the drawing, a much quicker and more certain process than that of so adjusting the drawing on the board that the fixed head square will fit the line.

Two or three *triangles* or *set-squares* will be needed, say one of 60 and 30 degrees, 11in. long on the longer side, one 45-degree triangle with 6in. side, and one with 4in.

The *set curve* or *Copenhagen ship curve* is both a necessity and a luxury to the marine draftsman. A few curves are absolutely necessary, but if much work is to be done the more one has the better, and it is an easy matter to expend as much as a hundred dollars in a complete set of rubber curves, including some of the circular sweeps of different radii for deck beams. At the outset half a dozen small pearwood curves will answer, at the expense of some labor and ingenuity in fitting each to the required lines, but this of itself is excellent training in the use of a large collection. Other curves may be added, one at a time, carefully selected as experience indicates.

For this size of board and the work proposed, a simple outfit of splines will be sufficient, two 24in. splines, one of rubber and one of celluloid, the former as stiff as can be had for the sheer, etc. The latter should also be as large as can be had, about 3-16 by 1/8in., this size being retained in the middle half of the length, but the ends may be planed down to a fine taper, for the level lines. A light celluloid batten 12in. long, similarly tapered on one end, is also useful for the sections of the body plan.

The question of the proper spline weights for this work is an open one; they may be of the smallest size, but not less than ten or a dozen in number, and this involves quite an expense if lead is used unless the amateur can cast them for himself as previously described. We hesitate to recommend a plan which is unworkmanlike, but there is a third alternative other than an outlay of six to eight dollars on the one hand, and the holding up of the family wash by the summary requisition of all the flat-irons in the house, our first resort, and that of many other beginners. Apart from the unsightly injury to the paper, making it look when removed from the board, like a chart of the heavens in June, very good and rapid work can be done by the use of fine pins driven through the paper and into the board to confine the battens. It is a good plan to cultivate from the start a care of the paper, keep-

ing it as clean as possible, free from needless thumb-tack holes, knots and erasures, and when the drawing is completed with title and number for filing, to trim the edges straight. The practice of making innumerable holes in the course of the work leads the beginner to treat his paper carelessly at all times; but to some it will be the best and most convenient way, saving the expense of weights and avoiding the difficulty of handling them near the edges of so small a board.

Useful as it is, the compass, for sweeping circular arcs, is not indispensable in this class of work, and it may be omitted at the start, the set curves partly taking its place. While a fairly serviceable set, compass with pen, pencil and needle points, can be had for two to three dollars, a really good set will cost two or three times as much. A pair of spring bows, for pen and pencil, will be much more useful for the numerous small circles than the large compasses. These can be had in the cheapest grades for about a dollar each.

There is one tool in which it is not possible to economize, only the best is admissible. This is the dividers, the 5 to 6in. sizes. As already stated, this should be of the best make, of light and graceful design, cut from the rolled plate of German silver, not cast, with a joint that works smoothly and evenly at all degrees of opening, the tool balancing well in the hand. One of the nice points in drafting is the proper handling of the dividers, by which the draftsman takes off quickly and accurately a distance and transfers it to another part of the drawing. This can only be acquired by constant practice with a good tool, and the attempt to work with a poor tool is worse than a waste of time. It is possible to make a drawing without the dividers, by taking off all distances on strips of paper with a pencil, and this plan may be followed at the start until a good instrument can be procured.

The hairspring dividers are useful, but not indispensable, as the same work, of numerous accurate sub-divisions can be done with the dividers with some extra care

and patience. The small bow spring dividers, which may be had as low as a dollar, are really more useful than the larger ones, as there will be many very small distances, such as the thickness of planking, widths of deck plank, etc., to be set off with them or the bow pencil.

Where cost is an object, the paper scales have much to recommend them, in spite of the error due to shrinkage of the cardboard, the divisions are even and easily read and the scales are convenient to handle. A set of half a dozen, 1/4in., 1/2in., 3/4in., 1in., 1 1/2in. and 3in. can be had for a dollar. A 5 or 6in. paper protractor, costing about 10 cents, will measure with sufficient accuracy all the angles of a design or sail plan.

A complete outfit of say four of the very best draftsmen's pencils, HHH, HHHH, HHHHH and HHHHHH, may be had for half a dollar, and will probably last for a year, so that the saving by purchasing a poorer grade is too trifling to be counted.

A drafting pen capable of doing good work may be had for about half a dollar, the better grades costing two to three times as much; as the pen is a difficult instrument for the beginner, it will be well to pay at least one dollar, if not a little more, for the certainty of getting a reliable tool. A few fine writing pens, Crowquill, are necessary for lettering and shading. The prepared inks can be had in all colors, the smallest sizes of bottles costing 15 cents, the colors required are black, blue, red and green. This list may be detailed as follows:

Drawing board	\$2.00
Paper, 1 quire of Royal	1.00
T square, 24in. blade75
Triangles, three75
Set curves, pearwood	2.00
Splines, three75
Dividers, 5in.	2.00
Scales, half-dozen paper	1.00
Pencils, four50
Pen, 5in.	1.00
Inks, liquid, four colors60
Thumb tacks, paper protractor, pencil and ink rub- bers, writing pens, etc.	1.00

	\$13.35
Bow spring set, dividers, pen and pencil	3.00
Spline weights	????

These prices are closely approximate and represent about the least possible outlay with which it is worth while to begin the practice of marine drafting. The articles enumerated are all standard, such as may be had of any reliable dealers in the larger cities. Most of these firms issue illustrated catalogues describing minutely the various grades of goods, a great help to the intending purchaser. The amateur who possesses sufficient mechanical skill to make his own drawing board, T square, weight and possibly splines, as many do who are interested in yachting, can provide himself with a good working outfit at a small expense. If good work is not accomplished, even with this unpretentious outfit, it will be from lack of skill and care or from over-haste on the part of the draftsman.

If the work is to be carried on on a more extensive scale, as in the case of the amateur who proposes to de-

STANDARD LAUNCH, U. S. NAVY, 40FT.

STANDARD LAUNCH, U. S. NAVY, SAIL PLAN.

vote serious attention to it, or of the builder who feels the need of working from detailed plans, it will be necessary to have a small room which can be specially fitted up. A drawing table 5 or 6 ft. long and 30 in. wide may be rigged on two trestles, as illustrated in previous chapters, taking care to have a good light, preferably from the north. Some provision must be made in a cabinet of shallow drawers or otherwise for storing the drawings flat; a rolled drawing is a nuisance only to be tolerated in case of necessity, and every drawing that has been rolled should be rerolled the reverse way and placed under pressure to restore its flat shape. Several drawing boards of various sizes, 12 by 17, 20 by 26 and larger, will be needed for sail plans and details, the sheets pinned on the boards and left there until completed. The designs proper will be made on the large table, preferably on paper not fastened by pins, but merely laid flat, as described in Part XVII., being taken from the drawer when needed and replaced after use. This relegates the T square to the background, except for the smaller plans, and calls for a true and reliable straightedge of wood or metal. The choice between the two, apart from the price, which is greatly in favor of the wood, is perhaps a matter of individual preference. A really accurate steel straightedge is a valuable tool, but on the side of the wood it may be said that it may be kept true or refaced if necessary, and it is much lighter and more convenient to handle, using a couple of lead weights to hold it in place.

The stock of paper will be increased by the addition of a roll of good white paper, 48, 58 or 62 in. wide, a similar roll of the better grade of detail paper, and possibly one of cheap rough detail paper for templates and large sketches. The sheet paper is, as a rule, less economical than the roll; the latter may be cut into as large sheets as can be placed under pressure in a large drawer, being cut up as wanted. If left in the roll it must be well pasted or pinned to the board before it will lie flat. A roll of tracing cloth will be needed and possibly one of tracing paper, though the fragile nature of the latter makes it desirable to use cloth for most work.

A plant for blue printing, even if of modest size, will be very useful, unless some blue printing establishment is near at hand.

The outfit of battens must be much increased, including a variety of lengths and shapes, and an ample supply of weights will be needed. The paper scales must be replaced or supplemented—for they are always useful in a way—by a collection of standard scales, preferably of wood faced with a white substance now used for this purpose. The number of scales will depend upon the amount and importance of the work; a good deal of time may be saved by having a flat scale with just the right divisions on the different edges. The stock of set curves, straightedges, triangles and similar tools will grow as necessity indicates. The outfit of dividers, compasses and similar tools should be large enough to allow of the use of exactly the right tool for any particular purpose, thus saving time. As a rule combination tools are to be

avoided, a suitable collection of special tools which may be used without change or readjustment saving valuable time.

The number of pens can hardly be too great, as it is very desirable to have the right size of pen for the special work in hand and yet be able to change it for another if it refuses to work. A stick of the best india ink, with a suitable rubbing slab, will replace the prepared black ink, the liquid blues, reds and other colors being retained.

The Quincy Cup Challengers.

A most interesting trio of 21-footers are the challengers for the Quincy cup, for they represent wide differences in design and promise to keep every one guessing until actual trials of speed shall show their respective merits. One of the trio is a high-powered centerboard while another is of comparatively low power, and the third is a semi-fin, or a combination of the plate fin and centerboard types. All are allied to the "scow" type in model, and one is an extreme in this direction, while each has special features in its design not common to the others.

The high-powered centerboard is C. D. Mower's Heiress. She is of his own design, and build, and in model and construction may be described as an improved Duchess, last year's champion Y. R. A. 18-footer. She is 38 ft. 6 in. over all, 10 ft. 6 in. extreme beam, and less than 1 ft. draft, and is to carry close to 1,000 sq. ft. of sail. In model she is more on the "scow" type than Duchess, although not the extreme in this direction, and shows full waterlines, a flat floor, an easy bilge and a flaring side. She is of light construction, and her outer skin is of canvas, as in Duchess. She is nearly completed, so far as her hull is concerned.

In sharp contrast to the Heiress is the boat which John R. Purdon is designing for Walter Abbott, to back up the latter's challenge through the Hull-Massachusetts Y. C. She is of the extreme "scow" type, with square ends, a flat floor, hard bilge and very full waterlines. She will be 36 ft. over all, 8 ft. beam and 9 in. draft. Instead of flaring sides she will have them "tumble home" to such an extent as to round into the deck without an angle. The idea of this is to save weight and the dragging of the rail through the water when heeled. She is to have about 850 sq. ft. of sail. Purdon is busy on the design and Fenton, of Manchester, will build her.

The boat with which W. E. C. Eustis will back the Beverly Y. C. challenge is an enlarged Capelin in model, with the improved "scow" bow, which Mr. Eustis has tried successfully on that boat and on his 33-footer, Cero. The new boat will not be centerboard, like Capelin, but a semi-fin like Cero, with a short fin through which a dagger centerboard can be thrust. She will be about 39 ft. over all, 10 ft. 6 in. beam and 3 ft. draft. She will show a marked "tumble home" to her topsides, and it is understood that in her construction, as well as in that of the Abbott boat, the frames and deck beams will be practically in one curved piece. She is expected to carry

about 1,000 sq. ft. of sail. Howland, of Monument Beach, is building her.

It is too early to estimate the chances of the boats as against each other, but the Eustis boat should certainly be a powerful sail-carrier, while the Mower boat shows fine light-weather qualities.—Boston Globe.

Answers to Correspondents.

No notice taken of anonymous communications.

N. C. L., Salem, Mass.—Kingfisher's mosquito preventive is this: One-half pint tar, half-pint lard (or vaseline is better), half-ounce pennyroyal, three drops creosote; mix with heat and can or bottle for use. Nessmuk's recipe is: Three ounces pine tar, two ounces castor oil, one ounce pennyroyal oil; simmer together over a slow fire and bottle for use.

M. S., Illinois.—What is the latest work on angling, and name of publisher. What line capacity of reel would you recommend for bait fishing for black bass, and reel, multiplier or quadruple multiplying? Is it unlawful for a non-resident crossing a State having non-resident game laws, to kill game for his own use? 1. "Fly-fishing and Fly-making for Trout," by Keene. Forest and Stream Publishing Co.; price, \$1.50. 2. Capacity of 100 yds., 12 or 18-thread. 3. Yes.

PUBLISHERS' DEPARTMENT.

On to Washington Under Personal Escort.

The fourth of the present series of Pennsylvania Railroad three-day personally conducted tours to Washington, D. C., will leave Tuesday, March 28. The rate, \$14.50 from New York, \$11.50 from Philadelphia, and proportionate rates from other points, include all necessary expenses during the entire trip—transportation, hotel accommodations, and Capitol guide fees. An experienced chaperon will also accompany the party.

For itineraries, tickets and full information, apply to ticket agents: Tourist Agent, 1196 Broadway, New York; 789 Broad street, Newark, N. J.; or address Geo. W. Boyd, Assistant General Passenger Agent, Broad Street Station, Philadelphia.—Adv.

The interesting announcement is made by the Pennsylvania Railroad Co., of a personally conducted Easter vacation tour to Washington, which will start on Tuesday, March 28, and will last three days. The entire necessary expenses of this trip are to be only \$14.50, which is not very much more than the mere fare to Washington and return.

To those who are familiar with Washington in the early spring this excursion will appeal with much force. While the people of the North are shivering in heavy overcoats and declaiming against March weather, those in Washington are going about in an atmosphere of May. Spring birds are singing and spring flowers blooming in the parks, trees are thrusting out their leaf buds, and the grass is growing green.

Nothing need be said of the attractions of Washington as a city, nor of the interest which attaches to its legislative and executive buildings. These are two well known. We may remind the Forest and Stream readers, however, of the National Zoological Park, where are to be seen in captivity many species of North American game, which one would be obliged to travel far to see in their native haunts. Besides this, there is the National Museum, crowded with objects of art and of natural history, which one might study for years without learning all about them, and the recently completed national library, which deserves at least a day.

Applications for information with regard to this tour should be made to Tourist Agent, 1196 Broadway, New York, or to any ticket agent. J. B. Hutchinson, General Manager; J. R. Wood, General Passenger Agent; Geo. W. Boyd, Assistant General Passenger Agent.—Adv.

THE WHITE FLAG.

The white flag shown in our illustration supplement to-day is one dear to the heart of many a sportsman, and the picture, as it travels here, there and everywhere over this land, will call up ten thousand memories of days afield. Some of these were successful and some unlucky; some were dreams of delight unmarred by any mishap, others were days of discomfort and misery. All of them, however, as seen through the rosy mists of the years are cheery and delightful in contemplation.

How many men, while working their slow way through the forest or the undergrowth have been startled by the defiant waving of this white flag, have seen the beaver bound high in air and come down with a force that it seemed would break his slender legs, have heard the soul stirring thump, thump of his swift feet; and then after a fruitless shot have carefully followed along the track in search of evidence that the shot had told.

We all know it well—the pursuit of the deer; whether moccasin shod we follow him over the soft newly fallen snow through the silent forest, or stand on a runway near the edge of some southern swamp, listening for the faint distant trumpeting of the deep voiced hounds, or on thoroughbred Kentucky or Virginia hunter follow those hounds over hill and dale and through forest and meadow.

There are probably only one or two States in the Union, where deer belonging to the Virginia, or white tail, form are not found; and its wide range and great abundance have made this species regarded as the deer to the exclusion of all others. Wherever we find it east of the Mississippi, it is the deer—the only one—even though moose and caribou roam the same forests that it inhabits. It seems almost impossible to exterminate it and if given a chance, the stock will always tend to re-establish itself even in districts where its numbers have grown very small. The constant pursuit to which the deer has been subjected has taught it many things, and to-day it is the most cunning abundant game animal of this Continent, and the most difficult to circumvent by legitimate means. Many a still-hunter, we imagine, has followed the track of a deer for hour after hour, often crossing his own trail and feeling sure that frequently the deer had him under its eye and was protecting itself by leisurely following the hunter about. This wisdom of the game, of which examples are so often seen and the strong attachment it feels for localities, make it a difficult matter to drive the deer from a home which it has chosen. Men may hunt it and dogs may chase it, and it will make a long round, but, after the pursuit is over, it comes strolling back in a leisurely way to its chosen home.

Naturalists have named several subspecies or geographical races which belong to the Virginia deer group. As a rule, the deer of the North differ markedly in size, and to some extent in coloring, from those in the South. The deer of Canada and Maine are much larger than those of North Carolina and Florida. The big deer of the upper Missouri are giants when compared with the little fellows of Arizona and Mexico, and the non-scientific person who should compare specimens from the North with those from the South might easily enough imagine that these differences were greater than they really are.

The habits of the deer have been more fully written of than those of any North American wild animal except perhaps the bear. Yet of all that has been written, there is little that is of any practical value to the young hunter who is starting out on his first deer hunt. For in deer hunting, more than in almost any pursuit, experience is the only teacher whose instructions are actually useful, and unless a practiced companion or a special providence takes the novice under protection he is not likely to kill a deer by any legitimate means during the first season of his hunting. And yet—as the exception to prove the rule—the hunter on his first hunt sometimes brings veni-

son into camp when the veterans are baffled and unsuccessful. There is adorning a home in this city a handsome deer head from Maine, concerning which, should you ask, your hostess would say, "Yes, we were out of meat in camp; and they told me I could take the gun to get some meat; they thought I could be trusted with it, and, of course, it was all a joke—as they saw it. I hadn't ever had a gun in my hands before; but I took it and went into the woods. And the first thing I saw was a deer; and the first thing I did was to shoot at it; and that's the head; don't you think it's a pretty one?"

THE WYOMING GUIDE LICENSE SYSTEM.

The State of Wyoming has taken a giant stride in the direction of efficient game protection by adopting legislation which is based upon the Maine system of licensed guides. The scheme is one which goes to the foundation principle of the State's ownership in its game as a valuable resource, the use of which must be controlled and restricted in such a way as to provide for preservation within reasonable limits. The new statute says in effect that the elk and the deer and the mountain sheep of Wyoming belong to the State, and the State will permit them to be taken by individual citizen or by visitor on certain conditions carefully laid down in the law.

The most interesting feature of the new law is the establishment of the guide license system. No person may engage in the business of guiding without first having procured from the justice of the peace a guide's certificate, which certificate shall state the name, age and residence of the holder, and shall recite that he is a person of good moral character. Every licensed guide becomes by virtue of his occupation an assistant game warden, and must file his oath of office as such when he receives his certificate; he is held equally responsible with his party for any violation of the game law, and if he fails to report the offense himself, is liable to the penalty and to forfeiture of his license for a period of five years. A guide is defined as any person who shall, for pay, aid or assist any person or party in locating, pursuing, hunting and killing any game. It is unlawful for a non-resident to kill game unless accompanied by a licensed guide; and at the end of every hunting trip the guide must report to the justice by whom his license was granted the number of days he has been employed, the numbers of persons guided and the game killed. The license fee is ten dollars per annum. In keeping with the principle that in the end the consumer pays the tax, this money will come out of the pocket of the non-resident sportsman; for the guide will recoup himself out of his employer.

If the manifest intention of the framers of the Wyoming law had been embodied in the text as enacted, the non-resident would have been obliged also to pay a hunting license fee of forty dollars. The phraseology of the statute is such, however, that the provisions relative to a license are permissive in character, and not prohibitory nor obligatory. The clauses bearing on this point read: "Any person who is a bona-fide citizen of the State of Wyoming shall, upon payment of one dollar to any justice of the peace of the county in which he resides, be entitled to receive a gun license, which shall permit such person to pursue, hunt and kill any of the game animals mentioned in the section." etc. But the statute does not say that a citizen must procure a license to kill game; nor that he may not kill game without a license. In like manner the provision as to non-residents reads: "Any person who is not a resident of the State of Wyoming shall, upon the payment to any justice of the peace of the State, of the sum of forty dollars, be entitled to receive from such justice of the peace a license; which license shall permit such person to pursue, hunt and kill any of the animals mentioned in this section, during the time allowed therefor of the current year." There is no specific obligation to buy a license, nor any prohibition of hunting without one. Nowhere in the entire text of the statute, is the procurement of a hunting license made obligatory on resident or non-resident.

The water killing of deer is a method of hunting which certain interests in Ontario are striving to have legalized. It is a mode which is almost universally prohibited in this country, and law against it should be restored in the Province.

SNAP SHOTS.

A common method of fish stocking in the West consists in rescuing the fish from places in which the receding of the water threatens their destruction, and transferring them to other bodies of water which are of permanent supply. In Utah the value of these enterprises is so well appreciated that it is made by law the duty of county fish wardens "to take or cause to be taken in the best practical manner any imported fish, mountain trout, bass or herring, found in pools or other places in which receding waters of the rivers, streams, canals or other waterways have left them, and which are likely to become dry, and to carefully put the live fish thus taken into main bodies of water, and to make the best disposition of the dead fish in the interest of the county treasury."

One of the first American victims, if not the first, of the American-Spanish war, was a marine killed by the accidental discharge of a revolver in the hands of a comrade. In a New York street last Monday a returned volunteer was explaining to a policeman the manipulation of his Krag-Jorgensen rifle, when the weapon was accidentally fired, and the bullet wounded three men across the street. What can be expected of the green-horn sportsmen, when professionals drilled in the use of arms perpetrate such acts as these?

Mr. Mariner A. Wilder of Warwick, New York, who died on March 9, at the age of eighty-five years, was a notable example of the substantial and successful men of affairs who find their best recreation in field sports. Mr. Wilder was for years known as the largest shipper of southern pine in the United States; his business connections extended to all parts of the globe; and yet for a half-century, from young manhood to the age of seventy-four at least, as Mr. Charles Hallock tells us, he never missed his annual moose hunt in the Canadian wilds. The health and vigor he found in these wilderness outings are aptly demonstrated by an incident Mr. Hallock recalls when Mr. Wilder, at the age of sixty-four, packed his bark canoe over the portages in the Muskoka country. Mr. Wilder had been a reader of FOREST AND STREAM from the first number.

We present to-day Mr. Chittenden's series of photographs of a Maine moose which were awarded the first prize in the FOREST AND STREAM's Amateur photography competition. Mr. Chittenden has supplemented the pictures with an account of the circumstances under which they were secured. How suggestive of new days and new ways is that point in the narrative where it is written, "We dropped our paddles and seized our cameras." Not many years ago the story of a Maine moose hunt, even in summer, would probably have read, "We dropped our paddles and seized our guns."

The new Maine game law might be termed a measure for the relief of burdened consciences; for assuredly under its provisions the summer visitor who shall lawfully kill his game this year will eat the meat thereof without those qualms which have impaired his appetite for the venison illicitly brought into camp under previous conditions. The new rule is that upon payment of six dollars if a non-resident, or four dollars if a citizen, an individual may kill one deer for food purposes in September. Just what the effect of the system will be as to the actual number of deer killed is, of course, a matter of speculation, and cannot be otherwise, since while the deer which henceforth may be killed will be reported by the guides and enumerated, no one can ever know how many have been killed unlawfully in past seasons. We may reasonably assume, however, that the number will be largely increased. The Maine Commissioners have thoroughly considered the situation and hold the belief that the stock can stand the drain upon it, and that the interests of protection will be served by the plan.

"Skipper, the master of a fishing or small trading vessel, hence, the master, or captain of any vessel." "Skipper, one who, or that which, skips." These definitions are from Webster. For an example in point, see the item of marine intelligence sent by our correspondent Special.

We regret to record the death of Mr. J. George Stacey, of Geneva, N. Y., one of the older sportsmen of the State, well known to a large circle of friends and by them sincerely mourned. Mr. Stacey passed away on March 19.

The Sportsman Tourist.

Highways and Byways.—V.

THE fishing season had long been past, chickens and grouse had left the open for dense thickets and upland pines. Even the October glamor of the duck season had worn away. Little by little the snows crept down the mountain sides until the mantle of white was within 500ft. of the valley. Little by little the ice by the margin of the lake grew thicker, and the steam that arose from the warm springs and hung over streams fed by artesian wells assumed the cloudlike appearance indicative of early winter. A long, dry, dreary autumn for the farmland; only along the slopes of the Wasatch the clouds lowered, left their fleece-like burden and then melted away in the heavens where they were born!

At length there came a change. The winds tossed the dried leaves hither and thither, moaned by day and shrieked by night, through naked branches and around fireless hearths. The sky was overcast, and the chore boy cut an extra supply of maple and aspen. Down from the far North on the wings of the storm came the ducks and the geese—the reserve corps of that mighty migratory host that had been hurrying in squads, in regiments, in brigades, for six weeks toward the flower-land of Mexico. Somehow the weather just suited my frame of mind, and when George H. dropped in to say:

"See, here, old man, you've simply got to get away from yourself and your surroundings," I knew that he wanted me to go after ducks. I looked at the gun that I had left uncleaned in its case for seven long weeks. I almost dreaded to take it in my hands, and yet—So I simply asked him what was up, and found that he had made all arrangements for one of our oldtime outings.

George and I, armed and equipped for anything that might come in our way left Provo on the 6:20 train that evening bound for the South. The feeding grounds of our erstwhile pleasure resort (Utah Lake) have been so destroyed by carp that there is not one duck now where there were 100 five years ago. Hence we were seeking pastures new. A ride of twenty-four miles brought us to the little village of Santaquin, where we were soon in converse with the local sports. There were tales galore of deer and chickens, but as for ducks, no one could speak authoritatively, although the spot where we intended going was only eight miles away. However, the two young men who had arranged for our team on the morrow and who were to accompany us, assured us that if we did not find ducks we could get plenty of jack rabbits.

Off goes the alarm! It is 5 o'clock, but dark as midnight; cloudy, cold and promising a good day for ducks. An hour later we have had breakfast and five of us—George H. and I, Goff and Reese, with Peter, the charioteer, climb into the farm wagon and drive off through the darkness. Long before we had reached the summit of the divide between Utah and Juab counties my partner and I decided that we had better give the slip to the rest of the party before commencing active operations for the day. Not but what they were good fellows and all that, but they would point their guns about in a most careless way, carry them loaded when it was dark as Erebus, and we were not accustomed to that kind of a crowd.

Just as dawn flushed into daylight we rattled down the slope toward the south. Before us lay the reservoir of the Mt. Nebo Canal and Irrigation Co., looking like a natural lake. This body of water is four miles long by one-half mile wide, and as it is comparatively shallow and its inlet contains the best of feed it is just the place for ducks and geese. As we drew up and uncoupled the horses we arranged the details for the day's sport. Geo. H. and I were to pre-empt the east side of the lake, while the others were to hunt the west side to their hearts' content. My partner found a sand spit, where he could build a blind, and I went on to the summit of the next ridge, and suddenly stopped. Before me and less than one-fourth of a mile away was a tremendous flock of geese. The intervening stretch was flat and open, so I lay down and watched the sun break through the clouds over the summit of Nebo—only five miles away and nearly 8,000ft. higher than the level of the reservoir. By and by the geese that had been standing like statues grew uneasy. They seemed to be holding a council. Then they arose simultaneously. I expected to see them rise high in air and soar away in regulation phalanx.

But no; they merely circled directly behind me and went down in the stubble, and at no greater distance than they had been before. Of course I tried the sneak act, with the usual result when one is after the wary goose. I tried to get them at a distance of 125 paces, the nearest that I could crawl under cover. If feathers fell I do not know it. George had also been crawling, and we arose together.

Then we went back to the reservoir, and coming to it at a little bluff, a flock of teal arose almost under our feet. We gave them both barrels. Three fell dead, and a couple of cripples escaped. George set these up for decoys, and lay flat on his back, covering his boots with moss. A few hours later he did some excellent work in this position. I went to where the geese had first been, made a blind of sagebrush with a moss bed, and esconced myself to await developments. Alas! there was no breeze; the threatened storm had melted away, and the ducks were enjoying themselves in the middle of the pond. Eight o'clock came, 9 and 10 had past. I had not had a shot. Presently the wind began to rise; a fog-like mass crept up from the southwest. Then came a gale, and there were snowflakes in the air. How those ducks came in and circled. I had scarcely time to set up the decoys. George, too, was exceedingly busy. At 1 o'clock I had to go back to the wagon for more shells. In passing my partner, I observed that he had a large pile of teal and one goose. My ducks were all grey ducks and redheads.

At the wagon I found the three boys around a sagebrush fire, getting dinner. They had secured two ducks

to our thirty-seven. They were going to devote the afternoon to jack rabbits. It was needless to urge me to remain for lunch, I had more important business elsewhere. In the afternoon George took my station and I chose a new spot, where there was fine feed. After putting out seventeen decoys, I sat with my feet in a ditch, and a single scanty sagebrush for a blind. The sport here was just as good as at the other places, but unfortunately all the other gunners about the lake became envious of our luck, and soon we had more shooters about us than ducks. Twenty-two was our afternoon bag. We were satisfied. At 4 o'clock we cried "enough," and in the gloaming, just as the snow commenced to predicate the first sleighing of the season, we drove back to Santaquin. When we reached Provo at 9 o'clock the next morning and felt sufficiently elated to take a hack at the station and pile the ducks up around "cabby" we were the observed of all observers.

The new Utah game law makes one very important change. Heretofore the open season on ducks has extended until Feb. 15, with no spring shooting. Now it closes Dec. 15, but the month of March is open. The reasons are obvious. Ducks that winter here breed here. Migrants do not breed here, and we have been preserving them solely for the sportsmen of Idaho and Montana.

The law passed Feb. 28. At 5 o'clock P. M., March 10, the Governor signed it. At 5 o'clock the next morning my alarm went off. I did not want to exhibit unprofessional zeal by starting out the evening before. In the chill of the dawn I was joined by Leo and Lester, and a five-mile walk brought us to Spring Creek, bordering on the preserve of the Salt Lake Sportsmen's Club. Sprigtails and teal were very much in evidence. They frequented the large and more open pools, while the larger birds were found solitary or in pairs in the small sloughs and ditches. We had a royal day's sport. The breath of spring was as exhilarating as the sport itself. From the rushes came the mingled croak of frogs, carol of blackbirds and querulous voice of the omnipresent muskrat, while from the distant meadows came the spring song of robin and lark. In the clear waters of the brooks we could see great trout working upward, and here and there the disturbed gravel showed that spawning had already commenced. Under the spring starlight we went home in Leo's buggy, which had come to bring back the trophies, and now I think the gun can rest until next summer's trip.

SHOSHONE.

Provo, Utah, March 16.

Just About a Boy.—XIX.

"Nothin' can't be much nicer 'n that, can it?" asked the boy as he stood looking up at the mist-hung peak of Inyan Kara Mountain.

The first rays of the rising sun were penciling the fleecy clouds with gold and crimson, while the lower bulk of the great hill was still a mass of indigo blue and a blended pile of rocks and timber reaching up to the sharply delineated crest.

"Say; I reckon ut a feller livin' down 'n th' flat country 'long th' river doanno what he's missin' tull he sees this kind o' sights, does he? Gee! don't seem s'ough juss light 'n' air'd do that, but I reckon that's all they is to it—ceptin' th' rocks 'n' timber 'n' things.

"Looks purtier 'n any picture 't ever I see—them kind ut fellers 'n' girls paints to hang on th' wall, yer know—on'y th' girls mostly allus seems to paint flowers 'stid o' mountains 'n' things; ut is, things like that. Reckon that haint th' girls' fault, though, 'cos they mostly stay where they's people 'n' don't come galevantin' round 'mongst th' mountains wher th' snakes 'n' bugs 'n' critters is; reckon they'd git th' life 'bout skeart out of 'em ahuner times a day if they did; so they natchelly just have to paint flowers.

"Course th' flowers ut they paint don't look much like reel flowers, but then th' girls is satisfied, I guess, so what's th' odds?"

"Well, young man, you'd better stop moralizing and get your pack sack on if we are to climb that hill and get back to camp to-day," I said, as I threw my traveling pack over my shoulders.

"Aw right, I'm with yeh," he replied, slinging the straps up over his sturdy arms and giving the pack a shake to settle it into position.

"Go ahead, 'n' I'll keep yer moc'sins a-movin'." Then we slowly conquered the pitching trail that led ever upward over steep slopes covered with smooth pine needles, where a misstep would have sent us crashing down into the gulch—on up over great masses of tumbled rocks that had ridden some snowslide half way down the mountain in former days and over all the little narrow ledges, where we must needs face the cliff and cling with our finger tips and moccasined toes and not look down into the dim gulch, with its mass of seemingly needle-pointed pines, pointing upward, so far below.

Past the sunny, moss-covered rocks, where the yellow violets grew in the crevices and the quaint, waxy mountain flowers sidle up against the boulders for protection from the winds that forever moan across the high places of the earth.

Then at last we came to the great cliff where the south side of the big mountain is broken sheer off and is only a smooth wall of rock 4,000ft. high.

Flat down on our stomachs, with the packs and guns left behind, we crept right to the edge and enjoyed the prospect that flattened away below like a play world in a sand heap.

"Gee!" said the boy; "this makes a feller feel creepy 'n' sort o' funny all over, like he's goin' to juss tumble head-fo'most away down there ont' them rocks 'n' trees 'n' things, don't it? Looky there! There's a big bird, a neagle, ain't it, sailin' 'long, 'way down there, 'bout half way to th' ground! Gee! don't it look funny to see a bird a-flyin' 'long 'n' us a lookin' at his back 'stid o' his breas'? That's th' first time I ever se anything like that."

"Lay still," I answered, "I'm going to roll a big rock or two over the cliff—you watch them and see what happens when they strike the ground."

Then I scrambled back up and started a big boulder to rolling out and over the cliff edge—then another.

Both slipped over the edge and no sound came back as they plunged downward into space.

"Gee! they're a long time fallin'" said the youngster. "There's th' first one—'n' there's th' other! Gee! They're knockin' trees down like pipestems—juss jumpin' 'n' rollin' like er couple o' cannon balls! Gee! but they're smashin'—there! one of 'em's busted all smash agin' 'nother big rock 'n' they's a sort o' smoky lookin' place, 'n th' air like ye'd fired a gun."

All this was a strange, new experience for the boy, and I smiled as I thought how I had long ago enjoyed the same "creepy" feeling that the boy described and watched big rocks crash down among the pines in the Uintah range, far beyond the Western horizon from our present perch on Kara's side.

"Come on, lad," I said; "we can't lose much time if we make the peak and back to camp before night. The trail from here on is smooth and easy, but it is long, so if you want to look at the rest of the world to-day we must be going."

Presently we were traveling the "hogback," where the trail was all the flat ground there was, and on both sides the mountain fell, steep and tree-covered, away to the lower world.

Above us were the junipers clinging downward from the great mass of creviced rocks that formed the peak.

The boy had a volume of comment and questions for me to listen to as we pulled ourselves up over these last obstructions and then stood on the top of the world, panting for breath but safe and glad that we were there.

When our pulses were normal and we breathed naturally again, the boy began:

"What's that sort o' a cloud 'way off over there?"

"Mountains. Probably some of the main chain of the Rockies; perhaps one of the high peaks in northern Colorado. This range over here to the northwest is the Bighorn chain away west of Powder River, where Custer was killed.

"That queer pile to the north there is Devil's Tower, just a strange freak of nature that has forced that pile of basalt up into the air and left it. Inyan Kara is formed of the same kind of rock. This little mountain all alone here to the north is Sundance Mountain, where the Sioux Indians hold their sun dances. These to the east and northeast are the Black Hills, each little chain having a name of its own. The nearest range is called Black Buttes; that's the Bearlodge Range just north of Sundance, and that one away off to the east, the one that only shows its top, is Custer's Peak."

"Gee, but they's lots of 'em ain't they," said the boy. "Say, I'm hungry, less eat."

His last remark brought a hearty laugh from me, and the old mountain top rung with more hilarity perhaps than had broken the silence of the upper regions of the world for many days. It struck me as a laughable thing when the boy abruptly mixed the grandeur of the view with the very material and commonplace idea of hunger. At any rate the lunch was produced, and the youngster did ample justice to the cold venison and hard biscuits that we had carried all the way up in our pack sacks.

"Gee, I'm thirsty 's a fish," was his next remark. "Where'll a feller git a drink?"

"Well, I guess we are a good way above the nearest running water. You didn't think that you'd go so high that there'd be no place for the water to run down from, did you, when you left camp?"

The boy looked blank.

"I never thought o' that," he said.

"No, I know you didn't; what are you going to do about it?"

"Go 'thout, I reckon," he answered.

"Well, you see you won't have to this time, my boy, because a good fairy told me there was no water up here, and I just put a canteen full into my pack for fear we might need it."

"Gee, but that's good fere sure," he answered with a grin, as he passed the canteen back after he had absorbed one-third of its contents.

"Now," I said, "let me tell you a few things that may be useful to you some time. Always remember that the peak of a mountain, unless it is a snow mountain or unless it is early in the season, is just about the driest place you can find on the face of the earth, and don't go up for any length of time unless you carry at least some water with you. Next, never drink very much at once up here, because it makes you unsteady on your feet if you climb in any of the bad places you are more than apt to find along the trail. Don't eat much for the same reason. You can get along very well on a mouthful or two of water at once, and just enough to eat to keep from feeling hungry is far better than a full meal in this high country. Then, you can travel better, are steadier and surer footed. Wait until you get lower down to eat or drink much and you will get along all right."

"Reckon I won't forget that—not after this here lesson sure," said the boy. He was a regular sponge when it came to just simply soaking up lore of the wilderness, and I knew would need no second prompting.

"You see where the sun is, don't you?" I asked, after we had sojourned for some time in the upper country. "We had better be going if we are to get back to camp. This is not a pleasant place to be after the sun gets down, for it gets pretty cold and does it very quickly, so let's go."

"Here—not that way—we'll go down the cliff. That is why I brought the ropes. Give me yours and we will knot them together in the loop ends, then we can double them around a tree trunk or pointed rock and slide down some pretty steep ground with safety."

The boy looked on while I explained this method of mountain travel, and then we started down the almost straight northern side of the great hill, rather than to take the time to retrace our steps over the long trail that wound up from below, and followed the great ridge of rock, which winds half-way around the peak just like the thread of a screw and gives the mountain its name.

"Ropeing" is a fast way of traveling down hill, and in an hour we had slid, clinging like flies, from the peak downward until we stood among the nervous, quaking aspen trees that grew in the bowl-like head of a little cañon. Down this cleft we traveled easily, and came out into the little glade where the grass grew and our transient home had been left early in the morning.

"Gee, it don't look like it was a day's travel to go up

there 'n' back, does it?" asked the boy, as we watched the blinking stars come out one by one and hang glittering in the blue-black dome of old Inyan Kara, the pile that had been named by the Sioux in the name of "a mountain within a mountain."
EL. COMANCHO.

Hunting Moose with the Camera.

Editor Forest and Stream:

As the season for hunting moose in Maine has been cut down to such a short one of late years very few people are able to go there in the hunting season. A good deal of fun, however, may be obtained, in trying to get some snap shot pictures of moose. This is not so very difficult in July and August, for at this season of the year the moose are very tame, for they do not hear the reports of rifles, nor see so many people as in October. This is the season when they like to wade out into the lake, to eat the pond lily leaves, which lie on the surface of the water. When they are occupied in this fashion a person can frequently paddle up between the moose and the shore, and drive it into the lake, where it is comparatively easy to take several good snap shots.

We had been encamped for several days on Eagle Lake, a small sheet of water in the northern part of Maine, but owing to the unpleasant weather we had seen but a few deer. At last, however, a sunny day came, and early in the morning my friend and I, with the two guides, jumped into our canoes and set off in search of something to photograph. We paddled down the lake about two miles and saw no signs of any game. Just as we reached the lake's outlet, however, we happened to turn around, and there, about half a mile from us on the opposite side of the lake was a cow moose. She had her back turned to us, and as a stiff breeze was blowing from her direction the guides thought that we ought to get pretty close, before being discovered.

We all began to paddle hard, but when we had approached within about 100 yds., my friend and I put down our paddles and took up our cameras.

The guides meanwhile paddled the canoes slowly forward until within a few yards of the moose, when she suddenly turned toward us; but it was too late, for we were already between her and the mainland. Without any hesitation she hurried off into the water. A long sand bar stretches out into the lake at this point for half a mile, and as a moose cannot travel very fast in water up to its haunches, we soon caught up to her. After fifteen minutes of chasing and picture-taking the poor animal became so tired that we let her go ashore, where she soon disappeared in the bushes, and was lost to our view. The pictures will give a clear idea of the different positions of the moose, as the canoe gradually approached her.

S. B. CHITTENDEN, JR.

Natural History.

Butler's Birds of Indiana.

MR. AMOS W. BUTLER'S Birds of Indiana, while published as a part of the report of the State of Indiana for 1897, is really much more than it purports to be. The author calls it "a descriptive catalogue of the birds that have been observed within the State, with an account of their habits." As a matter of fact it is an ornithology of Indiana, covering 321 species, to which is added a hypothetical list of 81 species, most of which may reasonably be expected to occur within the State, because they have been taken in neighboring States or because their known range seems to include Indiana. There are some species, however, in this hypothetical list, which having been found in neighboring States only as accidental stragglers, are hardly to be considered as possible Indiana birds.

The present work is an enlargement of Mr. Butler's "Catalogue of the Birds of Indiana," published in 1890, brought down to date by the insertion of additions made since his previous work was published and also expanded by considerable new material bearing on the habits of Indiana birds. Descriptions of the species are given, as well as a number of artificial keys taken from Mr. Ridgway's "Manual of North American Birds," and also from Jordan's "Manual of Vertebrates" and Coues' "Key to North American Birds." In fact, Mr. Butler has reached out in all directions, to gather material which should make a present catalogue as complete as possible, and besides the literature consulted, he gives a long list of zoologists whose individual assistance he acknowledges.

The author's experience with the birds of Indiana has extended over many years, and his familiarity with its avifauna is great. He is therefore well qualified to write about the birds of the State a volume which shall be not only useful to the ornithologist, but interesting and valuable to the popular reader as well, who, in these days when the true relations of birds to agriculture are beginning to receive attention, is anxious to learn more and more about them.

Mr. Butler's introduction treats of the physiographic characteristics of his State, and deals also with certain general conditions which influence the movements and the abundance of birds. He follows his introduction by several pages of bibliography of Indiana ornithology, and then come his keys to orders and families. Keys to the genera are found under the family titles, and those of the species under the generic titles. Then follows the name of the species, its description, range, nesting habits, and more or less material concerning its ways of life, with especial reference to its sojourn in the author's State. The volume is illustrated by many cuts, of which the greater number are taken from the various publications of the Department of Agriculture through the kindness of Dr. Merriam, while others are from Coues' "Key to North American Birds."

Throughout the volume Mr. Butler keeps always clearly in mind, and before the reader, the usefulness of most of our birds to the farmer, and urges their proper protection. His work is extremely interesting and cannot fail to be useful.

New York Audubon Society.

SEVERAL women among those who attended the annual meeting of the Audubon Society of this State in the lecture hall of the American Museum of Natural History yesterday morning wore birds' wings and feathers on their hats, although sentiments condemning the destruction of birds were applauded with marked unanimity.

In the absence of the President, Morris K. Jesup, Mr. Chapman presided, and made a brief statement, based on the society's records for the past year. The treasurer's statement showed a balance on hand of \$111. Mr. Chapman said that the work of the society was dependent largely on voluntary contributions of money, and he made an appeal for such contributions.

The following letter from Gov. Roosevelt was read:

My Dear Mr. Chapman: I need hardly say how heartily I sympathize with the purpose of the Audubon Society. I would like to see all harmless wild things, but especially all birds, protected in every way. I do not understand how any man or woman who really loves nature can fail to try to exert all influence in support of such objects as those of the Audubon Society. Spring would not be spring without bird songs any more than it would be spring without buds and flowers, and I only wish that, besides protecting the songsters, the birds of the grove, the orchard, the garden, and the meadow, we could also protect the birds of the seashore and of the wilderness.

The loon ought to be, and under wise legislation could be a feature of every Adirondack lake; ospreys, as every one knows, can be made the tamest of the tame; the terns should be as plentiful along our shores as swallows around our barns. A tanager or a cardinal makes a point of glowing beauty in the green woods, and the cardinal among the white snows. When the bluebirds were so nearly destroyed by the severe winter a few seasons ago the loss was like the loss of an old friend, or, at least, like the burning down of a familiar and dearly beloved house. How immensely it would add to our forests if only the great logcock were still found among them.

The destruction of the wild pigeon and the Carolina parakeet has meant a loss as severe as if the Catskills or the Palisades were taken away. When I hear of the destruction of a species I feel just as if all the works of some great writer had perished; as if we had lost all instead of only a part of Polybius or Livy. Very truly yours,

THEODORE ROOSEVELT.

The Rev. Dr. Henry Van Dyke sent a letter, in which he said: "The sight of an aigrette fills me with a feeling of indignation and pity, and the skin of a dead song bird stuck on the hat of a tuneless woman makes me hate the barbarism which lingers in our so-called civilization."

Mme. Lilli Lehmann was introduced as "a distinguished and loyal friend of the birds." She from time to time smilingly appealed to the audience to supply the proper English word to express her obvious meaning, but no difficulty was experienced in following her discourse.

Mme. Lehmann said that every person could do something toward protecting the birds. They could teach themselves and their children what humanity meant, and how much of human interest and loveliness there was in bird life. To be of service in this cause men and women must feel a sympathy for the birds. Their whole hearts and souls must be in the work. A very important thing was for all persons and societies interested in the cause to unite and work together. In that way their efforts would be most effective. In Europe there were many societies for the protection of the birds, and they all worked in harmony. Any person could become a member of these societies upon the payment of a nominal sum, equivalent to 2 or 3 cents. Their main purpose was to enlist all kinds of people in the movement for the protection of birds.

"I am sorry to learn," said Mme. Lehmann, "that there are no places in Central Park expressly for the purpose of feeding birds. I have eight places in my gardens where the birds may come and be fed, and they get just what they like."

Mme. Lehmann had prepared the following "appeal to women," which she desired the officers of the society to circulate as widely as possible: "I beg all women and girls not to wear birds or birds' feathers on their hats any more. Every year 25,000,000 of useful birds are slaughtered by this terrible folly. The farmers are already suffering from it, and women enjoy wearing feathers like savages. Flowers and ribbons are a thousand times more beautiful and more becoming. It is the duty of every woman and man to battle against this gruesome folly. For years my hats have had no feathers."

Prof. Albert S. Bickmore, curator of the Department of Public Instruction, exhibited a series of stereoscopic pictures of birds, such as are furnished by him to the normal schools in this State. During his address Mr. Chapman interjected a statement that the widespread use of the quills of the brown pelican for hat trimmings was fast bringing about the extinction of that species.

Morris K. Jesup was re-elected president, and nearly all of the other officers of the society were also re-elected unanimously.—New York Times, March 24.

Migration Routes.

Editor Forest and Stream:

Many writers and observers of birds have commented on the spring and fall routes of migration. It is stated on various and apparently indisputable authority that birds go north along the coast in the spring and south by inland routes. Is it true that the inland route is taken because the birds dread fast wind storms from the North and West, which would drive them over the ocean and to destruction?

Incidentally the introduction of migratory European species to Eastern parts of the United States seems to be a foolish proceeding, considering that the birds, seeking a winter residence, find themselves over the trackless and merciless ocean the day after the first long night journey. Have European birds been taken to the Mississippi Valley and freed?

It seems to be a fact that birds of a species arrive in Central Park, Manhattan, anywhere from a week to a month earlier than in Prospect Park.

RAYMOND S. SPEARS.

The Loon's Flight.

PROCTOR KNOTT, Minn.—*Editor Forest and Stream:* I have noticed what two of your correspondents say in regard to the flight of the loon. My observations not only agree with Mr. Sawyer's, but carry me a step further, and have led me to believe that a loon cannot rise from the water unless aided by a pretty good breeze used as a head wind.

I have shot at loons a great many times on the lakes of northern Wisconsin, and on Lake Superior, and have never known them to attempt to escape from danger unless there was a wind of which they could take advantage in their attempts to rise. I remember once, in company with my brother, trying to secure a loon as a specimen for mounting. The bird was in a lake about three-fourths of a mile long and about 200 yds. wide in its narrowest part. My brother was secreted at one end of the lake, and I in a canoe kept the bird in motion, trying to get it within range of my brother's gun, and giving it a shot whenever a chance offered. Although harried for two or three hours, it never once attempted to rise from the water. There was a slight breeze, if I mistake not, but not enough to be of any use in the loon's attempt to escape by flight. During the chase the loon swam a distance of 200 yds. or more under water, repeatedly, without appearing above the surface. Lake Superior fishermen tell me they have caught them in their nets at great depths.

Among those with whom I have talked on the subject, it is believed that a loon cannot rise from the water without the aid of a wind blowing directly opposite to the line of flight.

I was interested in Mr. Bignell's statement. What a storehouse of knowledge of natural history one can get by a constant reading of FOREST AND STREAM.

J. W. G.

Cats, Too.

Editor Forest and Stream:

In the collection of bear stories from the Sportsmen's Show, published in FOREST AND STREAM of this week, I notice a curious misprint.

Speaking of McKenney's bears, the article says—the scene of the incident was in the "beater piece," lying in the angle between the West Branch and Gardnahun Stream. This should read "heater piece." The term was common in early times in New England. It often appears in old papers, and was applied to triangular sections of land on account of their supposed resemblance to the household flat-iron.

As an admirer of Mr. Mather's writings, I hope that the off-shore stakes of the pound-net are well set; the Major is in for heavy weather, sure. Reason, instinct and heredity will all be after him. I agree with Hermit that heredity should be substituted for instinct, as in the case of young chickens scratching a board floor; but permit me to tell a cat story. A family cat became the proud mother of a large litter, and in a thoughtless moment the whole litter was ordered destroyed. The old cat's condition soon becoming uncomfortable by the pressure of the milk, she secured relief by cornering a half-grown cat, surviving member of a former litter, and making him take the place and duties of the late family. The substitute did not do his work willingly and was frequently cuffed into a proper sense of his maternal obligations. Did the old cat show reasoning power or only instinct?

A. C. STOTT.

STOTTVILLE, N. Y.

Eyes which see Big.

Editor Forest and Stream:

The other day a man spoke in my presence about a certain real or fancied peculiarity of the eye of certain animals, which, he said, caused the eye to dilate when the animal is subjected to sudden fright, thus transforming the pupil of the eye into a magnifying glass of high power. "Why," he said; "if a wildcat frightens a horse, his eyes enlarge so that the wildcat looks to him as big as a tiger." I have quit saying I don't believe things just because I never heard of them before, but, now, what do you think of this? I can imagine a man of the stone age telling this sort of tale to his offspring, the while their prehistoric little eyes grew wide with wonder and amaze; and then, when they ran out of the cave to play, I see him looking over at the old lady and smiling.

GEORGE KENNEDY.

SECURITY BUILDING, St. Louis, Mo.

Age Attained by Birds.

WE are often asked how long different species of birds live, but there is little definite information to be had on the subject. Recently Mr. J. H. Gurney, in a paper in the Ibis has brought together a number of statements on this subject, and discusses this at some length. Mr. Dresser, in his "Birds of Europe," gives an instance of a raven having lived sixty-nine years. Mr. Meade-Waldo has in captivity a pair of eagle owls (*Bubo maximus*), one of which is sixty-eight and the other fifty-three years old. Since 1864 these birds have bred regularly, and have now reared ninety-three young ones. A Bateleur eagle and a condor in the Zoological Gardens at Amsterdam are still alive at the respective ages of fifty-five and fifty-two. An imperial eagle of the age of fifty-six, a golden eagle of forty-six and a sea eagle of forty-two, and many other birds of the age of forty downward are also recorded.

Wild Ducks in Captivity.

Mallards and black ducks, as well as Canada geese, have been hatched under tame ducks, and have taken to the barnyard habits of their foster mothers without fear or distrust of man; still it is safe to pinion the first generation with scissors, as described. It is my opinion that both the blue and green-winged teal may be as easily domesticated; but, the early domesticators of beasts and birds looked entirely to utility, and so the smaller wildfowl were neglected. Taking the different ducks, which may be worth domesticating, I will give what I know concerning their dispositions, for they differ greatly; leaving out the mallard and black duck, which have been mentioned.

FRED MATHER.

The Vermont Animal not an Elk.

SHELDON, Vt., March 22.—*Editor Forest and Stream:* I have received a number of replies to inquiries made concerning the moose, caribou or elk that passed near here in December, 1897, and one of them—from an observing hunter and reliable man—I consider of value, though it is quite different from other letters received. Mr. Kittell first thought that the animal was a hybrid, but the description given in his letter is decidedly moosey.

STANSTEAD.

FAIRFIELD, March 11.—The animal you mention I will try to describe as nearly as I can remember it. I should think that it was as tall at the shoulders as a good sized horse, say fifteen hands, but not so high at the hips. In color the back and upper part of the body were dark, with legs and lower parts a fawn color. The horns were large and as nearly as I could judge were not round. I tracked the animal for several rods in the soft earth. It had rather a pointed toe with a very long and pointed dew claw and stepped along with a swinging gait.

J. W. KITTELL.

[We print this, as it seems to pretty well show that the mysterious animal about which so much conjecture arose was nothing more than a wandering moose.]

The Wild Animals of Wyoming.

A LANTERN lecture on the wild animals of Wyoming will be given at the Carnegie Lyceum, April 4, at 11 A. M., by Mr. Ernest Seton Thompson, in aid of the Edwina Free Kindergarten. The talk will be on the lines of Mr. Thompson's well-known book, "Wild Animals I Have Known," and will be fully illustrated with sketches and photographs of the wild animals themselves and the places they inhabit. The entertainment is especially interesting to boys. Tickets, 75 cents, may be had of Miss J. Lewis, 35 Gramercy Park, city.

Game Bag and Gun.

Game Laws in Brief and Woodcraft Magazine.

See announcement elsewhere. As the April issue will be governed by the advance orders, it is requested that subscribers will order now either for the year or for the April number.

On Kansas Prairies.

LOST SPRINGS, Kan., March 17.—*Editor Forest and Stream:* This town is situated on the old Santa Fe trail. It received its name from some springs of water bubbling up here on the prairie. In the freighting days this was the only water to be obtained along the route for (as near as I can learn) about forty miles. It was of such value that the springs were kept under lock and key, and the water was sold as called for. A saloon was also established here and a gentleman of my acquaintance has a .44 revolver bullet he picked up where the saloon stood. What stories that bit of lead could tell if only it might speak. The town lot was originally laid out around these springs, but with the coming of the railroad was moved three miles eastward and with their abandonment the springs for some cause, probably from the tramping of the great herds of cattle, ceased to flow. Hence the name. They have since come to the surface and flow steadily.

But it was to speak of the rabbit and his interests that I began to write. The rabbit season is over so far as their use for the table is concerned, although here they are shot the year through. I have been figuring a little about the number of rabbits killed in this section and am simply astonished at the result. Six hundred and seventy-five rabbits were, in a few days, shipped from the little town of Ramona, and I think this was not one-tenth part of the number killed in that vicinity. Two hundred and fifty of these (part jack rabbits, but mostly cottontails) weighed 1,100 lbs., giving an average of over 4 1/3 lbs. per rabbit; this multiplied by 675, would give an aggregate of over fourteen tons of rabbit meat raised in that one town. Multiply this by the hundreds of small towns in the State, and it reaches a total simply astounding and yet this is the true state of affairs. Yet bunny holds his own and if the season is any way favorable will be ready for next winter's sport.

Western-like, much of this supply of meat is wasted. Many of the cottontails are thrown away, and as most of the people here are prejudiced against their use, the greater part of the jacks are left where they fell, or fed to the hogs or chickens. One young man of my acquaintance kept a bunch of hogs several weeks mainly on jacks he shot and bought. As he could buy them for 3 and 4 cents each, they were cheap feed, but it looked too bad to one who loves the wild creatures for their very wildness to put them to such an ignoble use.

With the Kansas hunter the rabbit occupies a peculiar place. He is everywhere. I have seen his tracks leading under the platform at the railroad station; the school children have great fun chasing him from under the board walks about the schoolhouse; he investigates the cook shack each night; looks over the threshing machine, and we have even found him hid in the separator; hides under the barns and outhouses in the very faces of the dogs, springs out from the cornshocks and feed stacks, and even the feed racks of the cattle, is cursed for gnawing the young fruit trees, is anathemized for cutting the vines and rose bushes, and shot, trapped and otherwise disposed of at any and all times, but in spite of all, continues to increase, multiply and fill the land.

I for one am glad of it, for he makes pleasant many an otherwise dull hunting day. But there are days when, although the snow may be pressed solid all around you by his gambols of the preceding night, hours of tramping will not start a single rabbit. I thought I had his ways well learned, but either he is learning new tricks or is not the simple creature I had thought.

There are many ways of hunting practiced here. Many prefer to take a team and driver, with from two to six hunters, and go through the cornfields, shooting from the wagon or spreading out on each side, in this way covering a large space in a day's shooting, or what is much more deadly when the snow first comes, and is well drifted, tak-

ing a narrow unmowed slough. The rabbits at such times leave the cornfields and uplands and hide—in the daytime—under the slough grass, bent over by the snow. The team follows the center of the slough, and with the hunters on each side starts the rabbits, which are shot as they try to gain the cornfields on either hand. Others prefer to shoot from horseback, following much the same tactics, only that each hunter is mounted. Either way is very successful so far as numbers is concerned. The owner of the threshing machine that I am with has a little terrier dog, no bigger than a cat, that delights in following the rabbits through their burrows under the snow and slough grass, and will, if they are plenty, keep two guns busy until she gets tired out. But I do not care to have a hand in such slaughter.

I usually prefer to hunt with no company but my gun. If the snow is drifted, I find my way down through the cornfields to where it has drifted into the slough. The corn is full of rabbit paths all leading to the nearest slough, but there is not a rabbit in sight. Soon on the sunny side of a drift there is a burrow where Bunny is enjoying himself in fancied security. Stepping back of this I stir him up with my foot—could often easily catch him with my hands, but that would not be any sport—let him get off three or four rods and then the old gun speaks out. Perhaps he turns a few somersaults and stops, or perhaps covered by the flying snow, keeps on; but if the cornfield is not too near, the second barrel usually stops him. A little further on I kick one out from the grass and snow, only to see a bunch of brown hair and ears, or white tail and some paws disappear into the next bunch of grass. A little further and one has bored into a bunch of old hay. I stamp on this and there is another bit of fun. Again one has hid in a corn shock and I rattle and kick that until the game comes out running for dear life into what I suppose seems to him thunder, lightning and hail. And so I keep on until I have secured from three to six, when I think that is enough for once. But mixed in with this are the quail. Out from a bunch of unharvested cane or kaffir corn, or from the sunny side of the slough, with their quick whirr, so pleasant to us all, comes a bunch of these electrified muscles and feathers; and a few of them stay with me. And then—usually out of gunshot at this time of the year—occasionally there rises a few of the great brown-backed grouse of the prairies. I stop one if I can, but they are shot so close that (especially if it is some other sportsman that starts them) I do not feel badly if they are cunning enough to get off unharmed.

But what fills out the pleasure of the day are—if one has the eye to read them—the stories of the wild life written all around—stories of midnight tragedy or noonday comedy—revealed by the tracks of the untamed denizens of the prairies. I note here the track of the snowbird and lark, the quail and prairie chicken, the hawk and owl, and with them the track of the mouse and rat, and on up through the catalogue of the rabbit, skunk, mink, coon, coyote and very rarely the great timber wolf, each in its way revealing the character and life of its printer on the snow. May their numbers never grow less.

PINE TREE.

Some West Virginia Game Notes.

Just about a year ago a gentleman wrote to the FOREST AND STREAM an account of killing a fox with his cane. It had been tired out by a hound which was walking in behind the quarry. I do not remember who wrote it, but the incident impressed me. A short time since a similar occurrence was reported in this county.

A farmer living on the head of Williams River heard the cry of a hound coming into the river and supposed it was running a deer. He hurried down to the stream to take it off the trail, and saw it coming up the hill in his pasture. About 5 yds. in front of the hound was a large red fox. They were both walking slowly. When they topped the hill they trotted down, but it was evident that both were thoroughly tired out.

A farm hand saw them about this time and tried to encourage the hound by cheering him on; but at the first yell the hound quit work and sat himself down on his hind-quarters. This is often the result of yelling at a young dog.

No sooner had his pursuer given up than the fox laid down a few steps further on, in the open field, in plain view of his enemy. The two maintained their respective positions until the gentleman who had first noticed the hound came up and shot the fox with a rifle.

He gave the hound (a noble-looking dog, with signs of blood in him), a good home. He does not come from the immediate neighborhood, for no one knows him, and our people have good eyes for a dog. As near as can be ascertained, this same dog had been running the evening before on the opposite mountain, and probably had been on the trail many hours. Nemesis would be a good name for him.

Yes, we shoot the fox here, and trap, and poison, and destroy him in any fell way, and we have no apologies to make for such practices. He is a destroyer of small game, to say nothing of lambs and chickens. An Englishman once refused a good opportunity of killing a fox, and his reasons were a revelation to the people. There ought really to be a price put upon the fox's head.

My sympathies were aroused, though, at the miserable tale of the trapping of a fox on the mountain overlooking this village. A fox had been put in a hole in the rocks and a trap set for him. Fourteen days after that fox came out and submitted to his fate. When found he was nothing but a skeleton and was so weak that it showed no fear of the trapper, who put him out of his misery. A story of such suffering is painful to consider.

On Back Run a farmer found a fox in his barn the other day, just as it had killed the bunty hen. He went for it with a club and killed it. He considered it right remarkable that a fox should be so bold until it developed that he had killed the pet of a neighbor's boy, who had refused \$5 for it out of pure love and affection for the creature. A compromise was effected by the owner paying for the hen and taking the skin of the fox.

Poison was put in the carcass of a dead sheep on Williams River and one of the victims was a raven. About a quarter of a mile from the bait the dead body was found in the snow. Its size was noted. The raven here is a remarkably shy bird, and they had been considered about the size of a crow. But this bird would have weighed at least three times as much as a crow.

In my last letter I spoke of a sheep which was paralyzed by the effects of a little laurel which it had eaten and lying near the buzzard's nest, having its eyes eaten out by turkey buzzards, and afterwards recovering. I have been informed by competent authority that this was the fine Italian hand of a raven, and not of a turkey buzzard, as some of us had arbitrarily decided.

In the same article mention was made of the killing of a black fox, an animal that inhabits trees, making its home in a hollow trunk and jumping from branch to branch like a gray squirrel. It was once comparatively plentiful in this county. The female's maternal instincts are developed to a wonderful extent, and one of the wiles of the hunter was to pound on the trunk of the tree where one might be expected to have its abiding place, and if a mother fox was in the tree she would take a young one or two and try to escape by running from tree to tree. This looks like a pronounced case of nerves. A hunter saw such an animal jumping from bough to bough and shot it, as has been duly reported, but thereby hangs a tale.

The pelt was brought to a local merchant and it looked very valuable. After a good deal of bargaining it changed hands at the price of \$5. It was sent to a commission merchant in Chicago as a part of a consignment of furs. The returns were satisfactory in the main, but where the black fox skin should have appeared in the list the anxious merchant read: "One cat skin, 15 cents." There was a good deal of gloom in the store that evening.

An immense pulp mill is to be established on the beautiful Greenbrier River, about forty miles from its mouth, and all our people are in a state of exaltation over the matter, for the big industry, which was compelled to move on account of the pollution of the Potomac, was sought for by every section. This means much to the fishing below the mill, but there is plenty of room above. I wish some one would tell me, in case the washings from the mill cause the fish to leave the stream below it, whether the fish will be killed or simply driven to purer waters? The bass fishing in the Greenbrier is second to none.

We got no mail one day. Business was badly tied up. Cause: The colored mail-carrier killed a big otter in the Greenbrier and had to attend to the skinning thereof. The people on his route, not being informed of his sufficient reason, were very indignant until he explained. An otter skin is worth about \$8, and that is no small matter.

In Will Book No. 1, of Pocahontas county, is a will containing a clause which is indicative of game conditions seventy-five years ago: "Item. I will that my rifle gun remain at the homestead, to provide meat for the family."

In the records of the same county, about the same year, is the levy laid for wolf scalps. The fiscal affairs were in a good shape. The honorable court found that \$625 were needed to liquidate the expenses incurred the year before, and there being 559 tithable persons in the county it was ordered that \$1.10 be collected impartially from each. In looking over the items the greater part of the record is taken up with the allowing of bounties on wolf scalps at \$4 each. The wolves have all been exterminated, and gone are the days when the good wife would say, "John, the venison's out," and when John would take the rifle gun and hunt until he found a fat buck and killed it. In those days there was an iron-bound ——— against the killing of mother deer, though there was no close season. The man who violated this rule committed the unpardonable sin—it was decreed that he "should be a man abhorred!" We need ethics or a system of moral principles in preserving game as well as law.

ANDREW PRICE.

MARLINTON, W. Va.

Game in Jackson Hole.

JACKSON, Wyo., March 15.—*Editor Forest and Stream:* At this time it is evident that all the game in the Jackson Valley will survive the winter. About 5,000 head of elk are wintering among the settlements at Jackson and vicinity, and about 10,000 are estimated as wintering on the Grosventre and tributaries, but among these there will be more or less loss of calves. I have a letter from the upper Grosventre country, which indicates that the elk are playing havoc with the settlers' hay stacks, and that they have to watch them nightly; also that on Crystal Creek there are wintering about 400 head of ewes and yearlings, with very few, if any, large rams.

I have also reliable information that two different persons are capturing elk calves on Pilgrim Creek, north of Jackson's Lake. Whether or not the State game warden will proceed with prosecutions remains to be seen. The law, however, refuses the right to capture for domestication or speculative purposes; and the law being violated so early after its passage, we think bodes evil for the future.

More or less game is being killed in different localities, we fear, in violation of law, but it is to be hoped that with the State game warden a resident of Jackson Valley, the slaughter will be nominal, if not entirely restricted. A great many elk are killed every spring by persons who go into the mountains to trap bear. An attempt was made two years ago to prohibit the trapping of bear, and using as bait the game animals. It unquestionably can be stopped at the present time if the law is enforced. It is the opinion of a great many that for every bear trapped or captured, ten head of elk are killed and wasted, hence many desire that in relation to this matter the executive officers having in hand the protection of the game will, from this time on, do something toward, at least placing a barrier against this unusual and unnecessary slaughter of game for bait.

The appointment of the State game warden from among the residents of the Jackson Valley, was a just recognition by the Governor of Wyoming of the game interests of the State. We have no hesitancy in predicting that the game law will be enforced without fear or favor and with no discrimination as to persons; for certainly, it must be either enforced literally or it becomes null and void.

WILL L. SIMPSON.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

"MACKINAW, Ill., March 16.—I cannot refrain from expressing my thoughts over Mr. R. R. Wiley's letter published in *FOREST AND STREAM* of March 11. He has surely hit the nail on the head with regard to Illinois protection. Sure enough, 'What's the matter with Illinois?' I live within thirty miles of Mr. Wiley and can bear him out in everything he says. Here opposition toward game protection is so strong in some that threats are made on game wardens. Everything is shot regardless of open seasons or anything else, and it is getting so there is not much to shoot, either. Prohibition of spring shooting will surely help us out, for as to ducks, off the Illinois out on the prairies, there are none to shoot. Public sentiment is what we will have to have, to back up the laws, but the question is, how to arouse public sentiment? I for one will welcome anything in this line that will stop the slaughter and sale of game and fish.

"Quail are not injured the least in this section. We had no snow or sleet, and no dead birds are to be found. Squirrels will be pretty fair too. ILLINOIS."

As to Spring Shooting.

There is a fight on in Wisconsin this season against spring shooting. What the result may be is not yet evident, though it would be very gratifying to see this grand State swing fairly into line in favor of advanced protection, and abolish spring shooting altogether. Wisconsin has for some time held to the dog-in-the-manger policy that she will stop spring shooting altogether as soon as Illinois does. I think this is perhaps the most childish bit of legislation on record in the world. The thinking sportsmen of Illinois would stop spring shooting if they could, but if they can not, that is no reason why the thinking sportsmen of Wisconsin should not if they can. If Wisconsin stops spring shooting she benefits Wisconsin. Her unmolested birds will breed there by thousands. Mr. C. C. Chase, of Oshkosh, Wis., whom I take to be a thinking sportsman, encloses me a little slip which he has been circulating in his State to aid, as it may, in the fight against spring shooting. The same reads as below:

"1. Wisconsin sportsmen are about equally divided on this question of shooting water fowl in the spring. Those favoring it have had their own way for a long time—give the other fellows an inning.

"2. Prohibition of spring shooting for the next two years can certainly do no harm, and it is worth trying, if means are provided for enforcing the law.

"3. If a female duck escapes the Illinois hunters on her way north there is no reason why she should be killed in Wisconsin. Returning from her Northern nesting grounds, or, undisturbed by a roar of artillery in Wisconsin marshes, doing her hatching here, she will have about her a brood of young ones whose flesh, like her own in the fall, will be fit to eat.

"4. A farmer has a flock of farmyard fowls. Let some gunner in the months of April or May slay a large part or all of them. The number of fowls left to the farmer in the fall will be determined by the accuracy of the gunner in destroying the source of supply. Had he deferred his onslaught until the close of the nesting and raising season, the destruction of an equal number would still leave the farmer with a large increase in his original flock and a certainty of a still further increase the next year in case the gunner again postponed his operations until fall.

"5. Take your pencil and figure out the progeny of one pair of ducks in four years, assuming that they and their female descendants will raise an average of six male and six females each year. Deduct 80 per cent. for every possible interference, including fall shooting, and there are left 622 ducks to gladden the sportsman's heart and to help perpetuate the duck family. Make a guess on the number of female ducks destroyed every spring in Wisconsin (25,000 would be a low figure) multiply it by 622 and make up your mind as to what spring shooting is doing toward duck extermination.

"6. Don't wait until the horse is stolen before locking the door. Save the game while there is some left to save. There is no justice in allowing the present generation of gunners to 'hog' all the game away from posterity.

"7. Stop spring shooting for the sake of decency, good sportsmanship, conscience and posterity.

"8. Prohibiting spring shooting will be legislating in the interest of the whole people. The rich can always buy their way to good shooting. Unless the poor have it at their doors they cannot participate in it. A surplus of ducks would do away with closed marshes; there would be no necessity for the expense of guarding them from the public. This surplus can be speedily realized by the abolition of spring shooting."

Ex-Warden Fullerton.

Mr. S. F. Fullerton is now ex-Warden of Minnesota, a fact which his many friends will regret, though I am sure all lovers of protection will do everything possible to uphold the hands of his successor. Mr. Fullerton retires leaving countless well wishes, and I am sure I hope we shall often hear from him in the columns of *FOREST AND STREAM*. Under date of March 13 he writes to me: "Well, I will be an 'ex' to-morrow, and I thought I would write you a letter before quitting the office, as I wish to thank you for your many acts of kindness to me during the past four years. Some men complain that the newspapers always misquote them, and give them the worst of the deal, but my experience has been just the opposite. No man who ever held office could have received kinder or more considerate treatment from the newspapers than I have received. They have in many cases overlooked my shortcomings and given me full credit for any good I might have done for the cause of game protection.

"The president of the new board, Mr. Williams, is a very fine gentleman and a game protector. Mr. Cramb, the new treasurer, and Mr. Ward, the secretary, are both game protectors, and I do not think Governor Lind could have selected two better men in the State as members of the Game and Fish Commission. The man who takes my place I am not acquainted with, neither am I acquainted with Mr. Dantz; but I have no doubt that they are good men, and we all look forward to good results from their work, and I hope every game protector, regardless of politics, will 'buckle' in and help the new board as effectually as they helped me. I shall certainly

still continue to take an interest in game protection whether I am in office or not."

Michigan Game Matters.

In his sixth biennial report, Warden Chase S. Osborn, of Michigan, touches on some interesting points in regard to the game and fish life of his State. He admits that the flight of wild fowl is less than it has been, urges a limit to the bag, and strongly favors the continuance of the law forbidding spring shooting. He says that the ruffed grouse is about holding its own. A very remarkable increase of quail life has been noted, and Warden Osborn mentions the rapidity with which this bird is working northward. He states that the commission will try to introduce this bird into the north peninsula of Michigan, and thinks that the hardy little Bob White will hold his own even that far north. Thus far, Mackinac Island is the furthest northward that a quail has been seen. The bird is following the farms into the old lumber regions.

Warden Osborn has on the whole a sad story to tell about his game and fish. He says that squirrels and rabbits are less each year, that the fur-bearing animals are decreasing, that the bear is disappearing, that the wolverine is practically extinct, that the elk and wild turkeys have disappeared. He cites the killing of one moose in Mackinac county last fall, but learns of no caribou.

Warden Osborn speaks with pride of the game laws of his State. The State itself, and all its sportsmen might well speak in the pride of Warden Osborn when he utters the following words of wisdom in regard to the sale of game:

"There is probably no agency for the protection of game of greater influence than prohibiting its sale. To take game out of the market shuts off the market-hunter and the 'game hog.' I am not sure that it is at all wise to prohibit the sale of game and hook and line fish until the conditions make it absolutely necessary. The conditions of quail, woodcock, partridge, brook trout and grayling life in Michigan demanded the most stringent measures and led to the passage of laws interdicting their sale. As a result of this law and other regulations for their protection, these game birds and fish are on the increase all over the State, and have so firmly re-established themselves in field and stream that to perpetuate them indefinitely we shall only have to give them wise care. There are those who believe that at this time all game should be taken out of the market, and I am convinced that the time is coming when deer and ducks may not be sold with safety to their existence. The tendency of all forms of wild life is to extinction, and it is only by profound study and the application of the most earnest effort that we will be able to keep the inhabitants of forest and stream with us."

E. HOUGH.

1200 BOYCE BUILDING, Chicago.

Ontario Moose Opening.

Editor *Forest and Stream*:

There has just come from Ontario a case-hardened statement that protection does not protect. This refers not to an economic assault upon free trade and a tariff, but instead to the question of moose. It appears from this Canuck report that Ontario is dissatisfied. In the beginning, the Ontario Government set out to insure absolute immunity until 1000 for all moose within its borders, and, in a measure, it has done so. But by protecting its moose, the Government has unwittingly developed the art and trade of pot-hunting and poaching, until the state of Denmark were a veritable posey compared to the stalwart aroma of this game-law scandal.

Now, to offset this evil, it proposed to repeal the act protecting moose until 1000, and behind this appeal to repeal I am informed are many prominent citizens. It is their effort to have Ontario thrown open next September to moose hunters, or, in other words to lop off one year from the restriction.

The statements made by these gentlemen is that the close season has had the successful effect of driving away all the visiting sportsmen, to the benefit of the Indian and half-breed head and skin-hunter. No man, abroad for pure amusement, desires to antagonize the laws. He may, of course, go out on occasion and play ducks and drakes with the most ponderous statutes of a community, but I decline to believe that he obtains more than a fictitious enjoyment out of the anarchy. This, as it will be understood, has effectually kept sportsmen from straying into Ontario, and, on the other hand, has simply passed over their privileges to the aforesaid Indian and half-breed.

In consequence of the close season, Ontario has been stripped of the income from visiting sportsmen. In addition, the close season has lulled the game wardens into the belief that there was no one in the woods likely to slay the prohibited game. Like other game wardens, these Ontario officials spend all their time searching out substantial offenders and ever refrain from annoying the local poacher, in this case the Indian and half-breed. So the Indians and the half-breeds slay moose where and whenever they choose, and the only result obtained by Ontario is the price of experience.

To remedy this state of affairs, it is proposed to organize an association of guides formed somewhat on the order of the Maine Association. It is asserted that if many of these Indians and half-breeds were able to obtain employment as guides they would give up the occupation of pot-hunting. In organizing them, there will be an effort to point out the value of preserving the game. It will be shown to them that the revenue from sportsmen is much greater than that from pot-hunting. Once they come to understand this, it will be plain sailing.

In order to give these men an interest in their work, it is proposed that all members of the association be made deputy game wardens. They will be held personally responsible for the conduct of their parties, and will be required to report on the killing of all game by persons whom they conduct.

In relation to this matter, I have talked to Mr. Colin Rankin, of the Hudson's Bay Company, of Mattawa, and to Mr. C. C. Farr, of Haileybury. Both are in favor of opening Ontario next September. Moreover, they declare that public sentiment in Ontario is for it, and that no opposition has been organized. Mr. Rankin says that

the restriction upon moose has certainly increased the supply, but that it would have increased equally with a limited open season and a suitable protection in force from January to September.

"The sportsmen, as a class," said he, "kill the fewest moose. When they have killed the number allotted by law they cease hunting. With the pot-hunter it is different. He keeps on killing as long as he can find moose to kill. With an open season there would be game wardens in the bush and these game wardens, if properly instructed, would keep a strict watch upon the pot-hunter and sportsman alike."

Mr. Farr has personal knowledge of the slaughter done by the pot-hunters. He is convinced that if the guides were made game wardens they would find it to their interest to prevent pot-hunting. After talking with these two gentlemen and others, I am convinced that they are right and that it would be the best thing for Ontario to give up protection that does not protect, and permit its people to once more enjoy the income from which they have become separated.

M. H. F.

American Game Parks.

The "Forest and Stream's" Fifth Annual Report on Game in Preserves.

Moosilauke Fish and Game League.

Replying to your inquiry of the 16th, would say that I have not the good fortune to own either a fish or game preserve, but am pleased to be able to tell you that the results of the efforts put forth by the Moosilauke Fish and Game League have been very satisfactory.

This league was organized something over four years ago, for the purpose of securing the co-operation of the farmers, and other residents of the farming districts, in this section toward securing a better observance of our existing fish and game laws. We have succeeded even better than expected, having at present nearly 200 of this class on our membership list, the majority (or a large number) of whom, previous to the organization of our league, were either actual violators of our fish and game laws, or, at best, were not in sympathy with them; inclined rather to oppose any action of our State Commissioners looking toward any appropriation for these interests. The result of the changed state of feeling among this class of our population is very apparent in the very marked increase of brook trout in our mountain streams, and of lake and salmon trout and bass in our ponds and lakes.

The increase in deer the past three years, not only in my immediate section, but throughout the State, has been nothing short of phenomenal. During the season just closed (Dec. 15), some thirteen deer have been shot within a radius of twelve miles of the railroad station at this point. The largest number in any previous season, so far as known, is four. In the more thickly wooded sections north of here, where ten years ago a man could tramp all day without coming across a deer track, he cannot now go twenty rods in any direction without crossing several, and in certain favored localities the tracks are as thick as sheep tracks in a farmer's barnyard. We have not yet gotten together the figures on the total number killed this season, so far as reported, but it is safe to say the number will exceed the total of any three previous years together. Should the present increase continue, it will be but a short time when the shooting and fishing of northern New Hampshire will be inferior to that of Maine only in expanse of territory.

Several game leagues in the State, as well as a number of private individuals, have turned loose ring-necked and Mongolian pheasants within the past two or three years, but after the first season they seem to disappear completely. We occasionally hear reports of a scattered bird or two being seen in the neighborhood of Corbin's Park, but in most sections none are reported after the first season, notwithstanding every sportsman is on the watch for them. This would indicate that these birds leave the country after the first severely cold weather. We should very much like to hear from leagues and sportsmen in other northern States who have tried this experiment.

With best wishes for the success and increased prosperity of *FOREST AND STREAM* during the year, I am,

E. BERTRAM PIKE.

Woodland Caribou for Game Preserves.

During the past two years I have imported three woodland caribou. The States of New York, Pennsylvania and New Jersey have preserves well adapted for the habits and browsing propensities of this deer, yet it is a question if a single animal can be found therein.

The distinctly hardy qualities of the caribou render it capable of existing in low, marshy forests, where most other varieties will not thrive, and in many instances when its more delicate congeners are not available, this animal will be found valuable for stocking inexpensive tracks of swamp forest land. It is equally well adapted for preserves already in existence, and will browse comfortably along with the other cervidæ.

It is a mistaken idea that this deer can not endure the midsummer heat of a temperate climate, and also that lichens are absolutely necessary for its health and existence.

The caribou, while not large and powerful, is exceedingly refractory as a rule, having a very nervous and restless disposition, and it consequently requires the seclusion or a dense undergrowth. A lowland range, where the more tender watery substance plants and shrubs, such as lichens, willows, birch, etc., may be found, is very desirable.

The success of propagation depends greatly upon the manner of transfer from the place of its nativity to new ranges. It is needless to say that many failures in the propagation of ruminants are more directly due to inefficient care and protection while en route than to changed climatic conditions and food.

I am deeply interested in the propagation of game animals and birds, and trust the day is not far distant when our preserves will show rare collections of deer and other

ruminants, together with specimens of the rapidly-disappearing water fowl of the country.

C. LINCOLN FALL.

Sportsman's Association of Cheat Mountain.

The Sportsman's Association of Cheat Mountain have within the past two years started a very successful brant hatchery, under the care of Mr. A. G. Buller, formerly of the Pennsylvania State hatchery at Corry, Pa.

The first year we hatched over 200,000 purchased eggs and secured about 15,000 brood trout. The results have far exceeded our expectations, and the operating expense is quite small comparatively. We have twelve large ponds supplied by springs from the mountain side, and from a branch of the Cheat River above the club house. The association contemplates putting in an artificial lake in the near future. The fish grow very rapidly in these waters. Since the lumber camp has been removed from the vicinity, we notice a marked gain in the number and size of the trout caught. The railroad is now completed to within ten miles of the club house, thus cutting off seventeen miles of rough staging. The association, as usual, is in a good financial condition, and is constantly making improvements. Hunting is prohibited for five years in West Virginia, and our steward tells us that there is quite a large increase in the game noticed in the neighborhood. We have hatched out a great many Mongolian pheasants, but it is too soon to give a report on the ones liberated.

W. F. ROBESON, Sec'y.

The Upper Saranac Association.

Dr. Samuel B. Ward, President of the Upper Saranac Association, writes: "We have turned over to the State most of our township and no longer possess any preserve to speak of."

The Caton Park.

Judge Caton's game park at Ottawa, Illinois, was the pioneer fenced preserve of the modern type. While deer parks were common before Caton's time, especially in Virginia, his was the first park of which we have any knowledge where general stocking was attempted with the different species of American game. Mr. R. F. Prettyman informs us that at the present time there are thirteen deer in the park. One escaped recently and was killed. In Caton's lifetime it is probable that there were never more than 100 animals in the park at any one time.

Jerseyfield Preserve.

Your favor asking for any recent information regarding the Jerseyfield preserves is at hand. In reply would say that the trout (*fontinalis*) caught the past season, during May and June, averaged smaller than is usual. The cause for this fact is not evident, but I have noticed from past fishing records that every third or four year seems to have been an off year for large fish. We do not fish after the middle of June. Ruffed grouse are still scarce and wild, conditions which again emphasize the necessity of the adoption of the FOREST AND STREAM Platform Plank, as this vicinity is a natural breeding ground for these birds, and none have been killed on this preserve for two years past. Deer I believe to be slowly gaining in numbers, although some hounding and illegal killing is practiced outside our preserve by the residents of the adjacent settlements. These violations of the law it is difficult to prevent or punish without the favorable support of public opinion in the localities where they occur. Although the number of deer in the whole Adirondack region seems to have increased during the last two years, due, no doubt, to the facts that the present game law covering deer is the best so far enacted in this State, and that the majority of our people are law-abiding, it is my belief that if the game supply in this State is to be preserved for many future generations, more interest in and intelligence concerning the subject must be shown by the general public, and sufficient funds must be appropriated to accomplish the proper enforcement of the existing game laws, which will then be continually improved as public opinion requires. It is gratifying to note the good work which is being done by FOREST AND STREAM and the protective associations throughout the State and elsewhere, in educating the public in fish and game protection. Let the good work go on.

CHAUNCEY P. WILLIAMS.

Adirondack League Club.

In the matter of cultivation of game, the work of the Adirondack League Club during the past year, as in previous years, has been entirely devoted to the propagation of the different varieties of trout and to the protection of the deer in its 100,000-acre preserve. We have not undertaken to sow any land or cultivate any crops to furnish additional food for the deer, for the reason that the spring, summer and fall food seems to be ample, and the providing of additional winter food is a large proposition. We believe that the difficulties of protecting and of rigidly enforcing the game law and the club law have been almost entirely overcome. We kill about fifty deer a year, and we have evidence for believing that only one deer was killed during the past year in violation of the game code.

The period of experiment at Combs Brook hatchery is ended, and the methods are so well established that we shall next season quadruple its output. We distribute no trout that have not been fed and reared to a self-protecting age, but that age varies from two or three months to two or three years. During the past season we have distributed 155,669 brook, salmon and lake trout, and the capacity of the hatchery has been increased so that we expect to have about 1,000,000 eyed eggs, of which about two-thirds will be brook trout and the balance Atlantic salmon and Great Lake Salmon. We are avoiding any further experiments with other varieties of trout, in which we have had a somewhat mournful experience. So far as the law will permit us to do so we are getting rid of the predatory brown trout. In spite of their quick growth we do not want to have anything to do with them. One of our plant of brown trout was taken this summer, which weighed 9lbs.

We find on our tract the ruffed grouse in considerable numbers, and we have been frequently urged to introduce the Mongolian pheasant, but so far we have not been able to see our way clear to getting sport from these beautiful birds in our region. There is no difficulty about food or successful wintering, and by so much as we could reduce the foxes and owls the game birds would surely in-

crease. But hunting these birds without a dog is rather dull sport, and a setter dog is rather out of place in the Adirondack woods. The *Erethizon dorsatus* exists a good many to the acre, and he has a singular attraction for a blooded dog. A setter with his mouth full of hedgehog quills is an unhappy and useless animal, and a sore trial to his owner. He learns nothing from his bitter experience with the hedgehog, but will attack them again and again, so that it is practically impossible for us to use bird dogs in our region.

Have any of our brother sportsmen any suggestion to make in this matter?

Macgrane Coxe.

Mr. Macgrane Coxe has a preserve consisting of about 500 acres of land at Southfields, in Orange county, about 100 of which is surrounded by a wire fence 8ft. 2in. high, and containing fourteen strands of wire. The property is stocked with trout and some birds, and is preserved. Mr. Coxe is also a director of the Sterling Iron Railroad Company, which has in the same region a tract consisting of 22,000 acres of land, which has been for some years preserved under the statute.

Tranquility Park.

Mr. Rutherford Stuyvesant's game preserve at Allamuchy, N. J., includes an area of about 4,000 acres enclosed with a close board fence 9ft. high, with one barb wire at the top. Mr. C. W. Puffer, superintendent of the park, writes:

The game are doing well. The elk number seventy-six. Last fall five were killed, and we had one die this winter. The deer are doing well. There are, as near as we can estimate, about 300. The beaver are increasing and building dams on the streams. It is impossible to tell their numbers, for they are very shy and only work in the night. There is a lake in the park of about seventy-five acres, and it has been stocked with black bass. The bird department is managed by Duncan Dunn and Adam Scott. They have succeeded in hatching and turning loose about 2,000 birds. These birds are the English pheasant; they are hatched in April and May, and kept in a preserve until the last of August, when they are turned loose, so a great many of them migrate all over the country and get wild, so it makes good shooting. I wish to make a comment in regard to our game laws in New Jersey. The deer law is undoubtedly all right, except as regards deer in private parks. As it stands, it only allows park owners ten days to kill and ship deer. It seems to me that a gentleman owning a private park which is fenced should have the privilege to kill and ship his game at such times as deer are allowed in the markets of New York city.

Kildare Club.

Game conditions in the Kildare Club park were never better than now. The rabbits and hares are a continual prey for owls and foxes. Birds, other than native, do well except pheasants. They cannot procure feed in the winter.

The deer would do well all around here if the law was enforced. I think the State ought to pass a law to oblige every person that is not a citizen of the United States to pay a license of \$20 to hunt or fish in this State, and to put up a bond of \$100 to respect the game laws, and that the implements of hunting or fishing should be proof of the misdemeanor. The Canadian-French are the worst enemy the deer and trout have in these parts of the woods, and they don't care for the law or anything else. When an American goes to Quebec to hunt or fish he must pay \$20 or \$25 for a license.

HENRY DAY.

The Liberty Club.

Mr. T. A. James, Meriden, Ct., writes: I visited the Liberty Club ground last October, and the warden reported quail more abundant than usual. Partridge and gray squirrels were fairly plentiful. The pheasants have not done as well as anticipated. I think there has been quite a number liberated during the past five years, but it is very seldom that any are seen in the woods. I am hoping to see the day when more interest will be taken in stocking our Connecticut woods with deer, as I think they will give better returns to the sportsman than quail or pheasants. Foxes have not been so numerous in years as they are at present, and one fox will kill more pheasants and quail in one season than a sportsman would in ten years.

Mr. Charles T. Barney.

Mr. C. T. Barney writes: In regard to my small preserve at Southampton, Long Island, it has not been very successful. I am on the south side of the Peconic Bay, and as a consequence feel the full effect of the northerly winds of winter. Therefore the country is too cold for quail to thrive.

Adirondack Timber and Mineral Company's Park.

The park now contains 31,000 acres. Deer in this park are increasing rapidly since the abolition of hounding. The reason for this is twofold. First, there has not been over one-fourth as many deer killed in this vicinity since hounding was prohibited, and secondly, deer have wandered in here from adjacent parks, where they have been longer protected and have become more plenty, not being harassed by dogs, have remained here. Many thousands of deer winter on the park. Last winter there was a yard of deer containing an estimated number of 500 deer wintered within two and a half miles of my house. A thing that has not occurred before for fifteen years. Partridge are quite plentiful. Bears were also quite plenty last fall. Trout in ponds where I can effect perfect protection from the public are getting much more plentiful. Have not introduced any exotic game.

CHARLES FENTON.

The Dot Island Preserve.

The preserve of the Yellowstone Lake Boat Company is located on Dot Island, in Yellowstone Lake, in the National Park. Mr. E. C. Waters, President and General Manager of the company, writes as follows:

In our game preserve in the Yellowstone National Park during the past two years all of our animals have done well. We have raised two young buffalo, one last year

and one in 1897. The elk are in fine condition, and I think we will have three young elk next season. The antelope and mountain sheep are doing well. I would like very much to buy some more mountain sheep and antelope, but they are hard to find. I send you for your information a photo of the elk, buffalo and mountain sheep. These animals are, of course, now in winter quarters, and have to be fed. The steamer on its trips stops each day at the island, where these animals are kept, and it seems a source of much pleasure to the traveling tourists to see them. We have one little antelope that comes down to meet the steamer upon its arrival, and she is shot at from once to twenty times each day by the kodak carriers while she is eating sugar or cakes from the hand of some of their party.

Our game preserve is located on Dot Island, in Yellowstone National Park. The buffalo bull, McKinley, every one says is the finest specimen they ever saw. I killed a bull that weighed 2,600lbs., and he, I think, is larger than the one I killed.

E. C. WATERS.

Utah Notes.

THE new fish and game law of Utah is a compromise measure devised by a joint committee of the sportsmen on the one hand and the commission men and sciters on the other. The principal provisions are as follows:

It is lawful to take bass and trout, with hook and line, between the 14th day of June and the 15th day of December following; unlawful to have in possession during closed season or less than 7in. in length. Deer, male or female, may be killed during October. Season for partidge, chicken, pheasant, grouse, from Aug. 15 to Dec. 1; for mourning doves from July 1 to Dec. 1; for quail (only in counties of Kane and Washington), between Oct. 1 and March 1. It is unlawful to ship out of the State any game animals, game birds, or game fish at any time, but lawful to ship out of the State carp, chubs, suckers, mullet and bullhead, catfish, during time when it is lawful to take the same, and then under the direct supervision and inspection of game wardens; and all packages or boxes or other receptacles containing fish must have a tag attached bearing the signatures of the warden making the inspection, the name of the shipper, date of shipment, and number of pounds shipped. It is unlawful for any express company or any carrier to receive or carry any box, package or parcel containing fish without said tag attached.

The late Legislature appropriated \$5,000, for the establishment and equipment of a fish hatchery. This will be located either at Springville, Utah county, or on the Weber, near Ogden. The advantages of the proposed locations are equal.

The unusually heavy snows in the Wasatch have driven the deer down into the lowlands, and, especially about Springville and Provo, there has been considerable illegal slaughter. On Feb. 16, Game Warden Newell found near the mouth of a cañon opening on Provo Bench a couple of deer just killed, and in wretchedly poor condition, also a saddle horse. The tracks of but one man were found. He had evidently spied the officer a long distance off, and had made good his departure. The deer were disposed of according to law, the horse was retained. In due time the owner of the horse put in an appearance. He remembered perfectly well to whom he lent it. The borrower had also secured on the same day a rifle from Indian Jim. The result was the arrest of one Marion Draper, of Pleasant Grove. Draper endeavored to prove an alibi, but it was no go. He was in really indigent circumstances and Justice King let him off with the light fine of \$15 and costs. The money not forthcoming, Draper will languish for forty days in the county jail. This does not seem much, but will have a good effect, as it is the first conviction of the kind in Utah that has been made to stick.

SHOSHONE.

Green Mountain Notes.

MILTON, Vt.—Editor *Forest and Stream*: I am glad that I am at last able to report that the wild pigeon can now be classed with the birds that breed in this State. For the last half dozen years I have frequently seen wild pigeons in this town, sometimes single individuals, and again in small flocks of from three to a dozen. With but one exception all the birds were seen on the border of one of the large Lake Champlain marshes, where the low, marshy land is overrun with a dense growth of willow, a spot which a bird of such a shy, retiring nature would be most likely to select for its home. Last season a colony of perhaps half a dozen pairs nested and reared their young without molestation in one of these willow thickets, and two or three pairs nested in other portions of the same tract, seeming to prefer to be by themselves. None of the birds fell as prey to any of the local gunners, so far as I know, and I trust that they may make this their summer home when the nesting season comes again.

Ice-fishing is just now the prevailing sport along the lake, and during the past two weeks many large catches of perch have been made. The record catch at this place thus far is thirty-one dozen of perch in a day, with only one line. Most of the fishing is done from fish shanties, which are diminutive structures, but warmly built, and fitted generally with a small stove, so that no matter what the weather is, the fisherman can fish through his trap door in the floor of the shanty without entailing a penalty of chilled feet or frost-bitten fingers. The ice-fishermen make use of a very clever device for luring the fish to the vicinity of the opening. It consists of a perch closely modeled from cedar or pine and weighted with lead; attached to the sides of the decoy are metal fins that extend parallel along the body. The fish is attached to a small cord and is lowered to the proper depth, when a sharp jerking of the cord sends it darting about in a way so natural that the average observer would be willing to take his oath that a real perch was cavorting about in the depths below. Often the decoy is sadly scratched by the sharp teeth of the pickerel, which, thinking a genuine fish is before him, snatches the prize and dashes madly away with it, only to drop it in disgust when it is found to be only a bit of wood and metal. A few whitefish have been caught this winter, but the chief winter fish are perch, and anywhere a hole is made through Champlain's icy skylight perch in plenty will generally be found.

It is gratifying to note that in spite of two open seasons deer seem to be still plenty in this State, notwithstanding the predictions made on every side that one open season would exterminate them. Only to-day a neighbor saw a fine buck and two does a short distance from my house, and several others have been reported near by, all quite tame and permitting a close approach before they took alarm. The chief obstacle to increase does not seem to be so much the slaughter of the open season as the dogs that run at large in every community and chase and kill deer. This winter several instances have come to my notice, and the State commissioners have investigated several cases where deer have been run to death by dogs.

KENEWAH.

"Concerning an Epithet."

Editor Forest and Stream:

Anent the question propounded by you as to whether the writer of this "bit" became a convert to the creed of moderation in game killing, because of being called a "game hog," he begs to say that he did not; in fact he claims to be a charter member—so to speak—of the grand guild of game bag reform. He in fact reformed long before that inelegant epithet was coined, or even before sportsmen generally discovered that the game was disappearing so rapidly that it was necessary to curb the piggyish propensities of the market shooter and of many others who dubbed themselves sportsmen. He, however, thanks *FOREST AND STREAM* for having in years past, in very many ways, taught him sportsmanlike methods, which teaching may have perhaps been instrumental in bringing about his reformation.

If you will refer to any of the occasional squibs contributed by him to your paper during the past dozen years or so, you will find him always an enthusiast—a crank if you please—on the subjects of game protection and forest preservation, and not much given to the use of intemperate language, but he still insists that some epithet should be used to designate the "sooner" who usually begins shooting a few days before the season opens, and the "pig" who usually kills several times as much game as he ought in season, so that the lay mind shall not confound these creatures with legitimate sportsmen who observe the game laws and who are content with a limit which any fair-minded sportsman would concede to be a fair bag for a day's shooting.

At this late day when we have so many papers and magazines devoted to the subject of field sports, there is no possible excuse for the plea of a want of knowledge as to what constitutes a fair and reasonable "take" or "bag" for a day's fishing or shooting, and when we find a fellow who is not willing to confine himself to a decent limit, there is no earthly reason why fair, legitimate sportsmen should not designate him by some term that will indicate that they are not fond of him.

S.

Troy, N. Y., March 27.

Editor Forest and Stream:

I have read your editorial remarks about the epithet of "game hog." You are right. Conditions alter cases. I don't know that I should like to wear the bristles of a true "hog," but yet at the end of the season my score stands well up on the slate. Still, it is the work of many days, and every one of them enjoyed—the birds never go to waste. And yet if I only had one day afield during the season, I don't know as I should quit after three birds—one for the wife, one for the boy and one for myself—if I could find more. Your remarks are just, and I doubt not that many of these "better men" who cry out so loudly and diligently have at some time had a decided curl in their own tails. There are birds galore here—I can start fifty grouse any day, and I don't hanker after them all. There are days when I get one, and my companions get more; yet at night I don't bag the knees of my trousers chanting thanks to Heaven that I am not as other men: because, in truth, the only reason I didn't get more was because I couldn't hit them. Go ahead—if a man is in a condition to try out lard he shows it by pen and ink as well as afield.

W.

FITCHBURG, MASS.

PHILADELPHIA.—*Editor Forest and Stream:* I read your editorial, entitled "Concerning an Epithet." Mr. Schenck's criticism thereon followed in *FOREST AND STREAM* of March 25.

By way of illustrating how variously different minds will vary on the same subject, I wish to say that to me the editorial seemed sound and its position well taken. To me it did not in the least seem to be a defense of the so-called "game hog." It deprecated the use of intemperate language in dealing with him.

The bandying of epithets does not appeal to the reason of anyone. Their use shows, however, that the one who uses them is unpleasantly emotional. A man in bad temper is never a good judge of what is best for himself; much more than is he unfit as a judge to determine what is best for others. The calling of names is a grade of mental exchanges which is at its best in your Bowery in New York, and other places the world over where billingsgate takes the place of reasonable argument; and this is far more likely to provoke hostility than it is to induce reformation. Of course, a mild epithet is not to be classed as billingsgate, though as an expression of ill-temper it may be remotely allied to it, but so far as having any reforming effects it is exactly like it. Men do not like the crack of the whip, figuratively or literally. Most men are reasonable and will do right if they are persuaded that a proposition is in itself right; most men will purposely refuse to follow any proposition right or wrong if they are coerced.

Mr. Schenck interweaves some fallacy in his argument. A man who steals is a thief. That is all granted in regard to the cash, chickens, etc. Those matters are a subject of statute law, and have so been from time immemorial; but when he shifts his ground and deduces from matters of statute law that matters of opinion are equally well established, he weakens his case by its evident fallacy. If I think that my neighbor is killing more birds than in my opinion he is justified in killing, and therefore, because I think so, am justified in calling him a "game hog," there is no reason why some other man

who also was displeased in some way with my neighbor or myself should not therefore call him or me some other epithet, and justify it because in his judgment that epithet was what he felt like calling him or me something offensive, and therefore he was right.

The phrase "killing more than their share," used by Mr. Schenck, carries with it an admission which would seem to indicate a denunciation of the "game hog," from the standpoint of individual resentment rather than a philanthropical yearning for public good.

Your editorial impressed me as a call for other than the old methods in dealing with men who killed a quantity of game, more perhaps than the supply would warrant. How many converts were ever made by the doctrine of oburgation? Let those who thunderously hurl the term "game hog" show how much their pet anathema has done for game protection. Let them show how many men have restrained their killing proclivities because some individual asserted that they were "game hogs." Let your readers hear the experiences of the reformation whose magic lies in the one epithet, the one potent word, "game-hog." Men have indeed changed if they will cease to do ill and strive to do good at the uttering of an epithet.

Would it not be better to try the doctrine of reason? Why not show the offenders that their course is really prejudicial to the interests of the community and therefore to their own? Why not exercise some forbearance and charity with the offenders? Why not patiently work to have the legal limit made a matter of statute law, thereby taking it out of the realm of private opinion into that of a fixed rule of action for all? Why not also recognize that personal spleen is not necessarily a public principle?

If sportsmen are gentlemen, as I believe them to be, then their utterances, actions and instincts should be those of gentlemen. All need forbearance and charity. If I, myself, am a model in regard to game protection, perfect in this I may be an offender in other relations. A wise and good man once remarked, "He that is without sin among you, let him first cast a stone," and that voice has been echoing down through the centuries.

L. A. CHILDRESS.

A Maine Skipper.

Boston, March 27.—According to special dispatches to the daily papers it seems that the shipper of seventeen or eighteen saddles, arrested some weeks ago, already mentioned in *FOREST AND STREAM*, has escaped. He was the captain of a small water craft, and was arrested at Eastport, March 3, for attempting to ship the saddles to Boston. He was under \$3,000 bonds for his appearance in court. On Wednesday last he was again arrested for the same offense, that of shipping deer saddles from Cherryfield to Eastport and on board the steamer there, doubtless for Boston. The warden allowed the fellow to complete the unloading of his craft, after he had arrested him, which took but a few minutes. He was then allowed to step into the steamboat office to sign his bills of lading. The warden remained outside. Soon the warden, thought that it was time for his man to appear, and begun a search for him. He could not be found anywhere about the wharves or other craft. He then sent another officer over the ferry to Lubec to watch for the deer shipper there. On the way over the ferry a small schooner was passed, and behold, there was the little deer-shipping boat hauled up on to the deck of the schooner, and a glass showed that its owner was there also. The schooner was under full sail up Pembroke River. The chase was abandoned for the time being, the officers feeling sure of their man later. Other cases are being followed in that section, and it is worthy of note that no new venison is coming into Boston markets. I am informed, from authority that cannot be denied, that the game wardens have been instructed to stop this shipment of deer to Boston at any cost. One case of extreme poverty has been followed up, and unmistakable signs of deer slaughter by dogs discovered. But a family of small children touched the hearts of the officers, and the man promising to kill his dogs and give up the business, he has not been prosecuted.

SPECIAL.

Boston Notes.

Boston, March 25.—The first shooting party of the season, for the preserve of the Monomoy Brant Club, left Boston on Wednesday for that well-known hunting ground. The party is made up of A. H. Wright, Captain E. Frank Lewis, R. S. Gray, H. D. Reed, Joseph Dorr, Henry Colburn, R. H. Gardiner, and one or two others. These gentlemen have visited Monomoy together for many seasons, and though they are pleased to style themselves "The Boys' Party," there are several senior shots and hunters among them. This is the first brant shooting party of the season of 1899, there being four or five parties every season visiting the preserve for a specified number of days. The parties alternate; that is, the last party of a preceding season is the first one of the following season. The present season is very late, however, the boxes not yet being all ready. The weather has been exceedingly stormy and rough, with but little time for getting the shooting boxes or pits in shape. Members of this, the first party, are expecting good shooting. They feel that they were too late last year.

Boston hunters and fishermen seem to be highly pleased with sport in Florida the past season. Charlie Brown, himself a lover of rod and reel as well as shotgun, presents a letter from his shooting and fishing friend, C. H. Alden, at Homosassa, Florida, not far from Tampa, on the Gulf. This letter says that all the fishing and shooting one need ask for can be had in six hours a day, and loafing or resting the rest of the time. He says: "My first day fishing I took 88 trout, the string weighing 103lbs.; all on my small rod." He does say what sort of trout they were, but visitors to that part of the country will understand that. "My friend has also taken in one day eight red bass, weighing 212lbs. The same day I took forty bass. We have had great fishing from the start. Gunning for woodcock, quail, wild turkeys and snipe here is great sport, and one is sure of a good deal of success. I have succeeded in shooting an eagle, with a spread of 8ft."

SPECIAL.

Massachusetts Notes.

DANVERS, Mass., March 20.—*Editor Forest and Stream:* An act of the present Legislature approved March 1, provides that "every Lord's Day shall be close season. Whoever hunts or destroys birds or game of any kind on the Lord's Day shall be liable to the penalty imposed for violations of the law during other closed seasons, and such penalties shall be in addition to those already imposed for violation of the laws relating to shooting upon the Lord's Day."

This will be a little tough for the poor man that is confined to his labors six days in a week and would like to go out in a decent way and get a shot or two. Such a man never would have been legislated against. It is because of the rough city rowdies who want to go out on a spree and shoot every songbird they find, insult the farmers who object to their invasion, and finally end up the day by shooting 100 shots of black powder cartridges at a mark back of some church where religious services are being held. That is the reason we have to have such laws.

This law will make quite a fuss with the beach bird shooters around Ipswich. All along that coast and tributaries are summer cottages that are owned by city people. Saturday afternoon the sportsmen all come up to their shanties and have a grand old time all day Sunday, with more or less shooting. It is an out-of-the-way place, and probably disturbs no one, but there is a good chance to make it unpleasant for them if one is so disposed.

The brant shooting season will open in Chatham, on the Cape, this week. The first party will be of Boston gunners, who will occupy the club house for a week. Then other parties will come for six weeks or so. Off Morris Island is one of the best feeding grounds on the coast. Most of the shooting is from large boxes sunk in the sand and live decoys are used. The Monomoy Branting Club was organized more than thirty years ago and more than 10,000 birds have been killed. It has a large membership, each member paying \$15 for one week's board and guide whether he goes or not. This fee is used to support the club and to pay the expenses of preparing and caring for the blinds.

Reports on quail are not very encouraging; don't hear of any dead, or even live ones very often.

JOHN W. BABBITT.

Vermont Deer.

A TOWNSHEND correspondent writes under date of March 21 to Commissioner Jno. W. Titcomb: "The deer in this section of the State are doing finely, and are on the increase. There are three yards within five miles of this village. Parties keep coming to me saying that dogs are chasing the deer every few days; also in the towns of Winhall, Wardsboro and Grafton that dogs are doing bad work. Two have been killed by dogs in Winhall, and steps must be taken to stop it. There must be in the first yard, only one and one-half miles from the village, at least twelve or fifteen. The other yard they say has eight; did not say how many in the third yard. So you can see they are doing very nicely, and I am glad it is so."

"H. T. E."

Commissioner Titcomb has just captured a poacher in Essex county who had killed a call moose near Island Pond, and is now under \$200 bail. The head of the moose was confiscated.

Mongolian Pheasants in Virginia.

CHARLOTTEVILLE, Va., March 21.—*Editor Forest and Stream:* I regret to say, in reply to your inquiry, that the Mongolian pheasant enterprise of our gun club has not been what we expected. While it has not been an entire failure, it has not been an absolute success. The birds didn't seem to nest, and aside from that, we think the "pot-hunters" destroyed some of them.

The gun club, however, are not entirely discouraged, but are going to give it another trial this summer. The climatic conditions are all right, but the fault may have been with the birds themselves. The change from the far West (Wisconsin is where the birds come from) to the South may have had all to do with it, that they didn't nest. Probably some of your readers may be able to shed some light on this phase of the matter.

While the partridges suffered a great deal during the cold weather, and a great many were frozen, reports from the country are that there is enough left for this year's crop.

J. H. F.

Spring Ducks and Sitting Hens.

IN spring there is no sport in shooting ducks the way the blue bills work here. They are like a lot of sitting hens, and there would be about as much glory in shooting the former. It is no trick at all to shoot from 50 to 100 ducks a day, and any man who will shoot that many ducks a day cannot expect to be considered anything but a game hog. Two dozen ducks a day is enough for any man to shoot, and a man who is not satisfied with that many is no sportsman. Of course, a market-hunter wouldn't be satisfied with that, but then such people wouldn't be satisfied as long as there is a duck unshot. Prohibit the sale of game at all times, limit the bag to twenty-five ducks a day, prohibit spring shooting at least for two years, and stop open water shooting, that's our platform.—Fox (Wis.) Representative.

A Woodcock in Philadelphia Streets.

PHILADELPHIA, March 23.—*Editor Forest and Stream:* While passing Seventeenth and Chestnut streets I was surprised to hear that sound pleasant to every sportsman's ear, the woodcock's whistle, and looking up saw the bird going north, dodging under the trolley wires, then rising over the buildings. It is an uncommon place to see this bird on the wing, but it is not an uncommon thing to see game of all kinds at the groceries and provision dealers offered for sale. When will this ever be stopped?

C. F. S.

Sea and River Fishing.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iv.

To the Occasional Angler.

If the times are unpropitious and you find your "catch" of fishes, As the sun is sinking westward, hasn't panned out quite the thing; There's a method, "on the quiet"—ah! how many experts try it! That may, despite your failure, send you home with quite a "string."

There are natives on the lookout for the man with pocket-book out,

On a fun-and-fishing frolic, when the fates don't use him well; And he feels his reputation on a slippery, slim foundation— They've a remedy convenient—they have always fish to sell.

Do you ask me how they get them? Why, they snare them and they net them,

With the aid of vile "contraptions," which the game laws quite condemn;

What they're after is your money; that's their manna, milk and honey,

And the "modus operandi" matters not a jot to them.

If, by look of by suggestion, you their plans should seem to question,

You are simply wasting time, my friend; the truth they cannot speak.

Ananias isn't "in it," they can tell more lies per minute Than that star prevaricator could engender in a week.

Though of aspect dull and drowsy, though of locks unkempt and frowzy,

Though of soiled and freckled cuticle, and costume rude and strange;

In their frowziness and freckles, they're as keen in quest of shekels,

As the diamond-decked deceivers that vociferate "on 'change."

In their nasal, jangling jargon, they're the boys to drive a bargain,

And their weird and woful bearing knocks expostulation dumb; As they swear in gibbering gammon, they're the prey of pinching famine,

Though their beards and breaths betoken much tobacco juice and rum.

Well, ignoring their devices, be prepared to pay their prices;

For, with india-rubber consciences, they'll "salt" you every time;

Promptly pour them forth your treasure (you can curse them at your leisure),

At the rate of, say, a dollar for a fish that's worth a dime.

Then, triumphant, home returning, you will gratify the yearning,

Of admiring friends and family, and thrilling tales you'll tell; Of the deep pools where you sought them, how they "struck" and how you "fought" them,

While you picturesquely pose, a perfect Isaac Walton swell.

So, when cometh your vacation, and, as means of recreation,

You proceed to plot and plan a piscatorial "jamboree"; Bear in mind no bait nor tackle, fluttering fly, nor fluffy hackle,

Will be half as efficacious as the greenback marked with V.

ED. LEGGO.

HARTSDALE, N. Y.

In the Pound-Net.

BY FRED MATHER.

If a "fish hog" is one who catches more than he can use, then I am right in his class since the pound-net was set in the extensive waters within the jurisdiction of FOREST AND STREAM, for the net, now only a few weeks old, is capturing more than I can market each week, and there is a fear that the Board of Health may come down on the catch if it is held too long. That's only what Mrs. Partington would call "a paralogical way of putting it." The only thing that really disturbs the relations between the supply and demand is the blue pencil of the editor. He is analogous to, if not homologous with, the Board of Health, which often orders tons of fish, meat, game, poultry and vegetable thrown off the docks of New York or to be taken to Barren Island to be cremated and is to be honored and respected accordingly. He is the auto-

HUNTING MOOSE WITH A CAMERA.

By S. B. Chittenden, Jr.

crat, not of the "Breakfast Table," but of that greater lay-out, the FOREST AND STREAM, and, as he sits in the clock tower, he carefully scrutinizes all things. Hence, he is the man to be dreaded. The things which swim or drift into the pound-net have to pass his olfactory before the public are allowed to sample them. That's an awful state of affairs, but "what are you going to do about it?" as an old-time politician asked.

Fresh-Water Turtles.

Mr. Russel Mott, in FOREST AND STREAM of March 18, asks some questions under this head. It is a poor way to get anything from a man by abusing him, and, notwithstanding the fact that Mr. Mott has branded me as "omniscient," whatever that may be, I will ignore the aspersion and go on to talk about such turtles as have met me in the ponds or in soups or steaks.

If Mr. Mott; I refrain from calling him hard names, will turn over his files of FOREST AND STREAM and read my "turtle talk" in the sketches of "In the Louisiana Lowlands," Sept. 24, and Oct. 1, 1898, he will get some descriptions of Southern turtles and also learn how to bake a soft-shelled turtle, the best of all the fresh-water species.

The small pond turtles found north of New Jersey are edible, but too small to bother with, for it is more of a job to disjoint one turtle for soup or stew than to do the same thing for a score of chickens, for the turtle is put together to stay there. In Virginia and the South there are the "sliders," both red and yellow bellied, so called because they slide off the logs when danger comes. They will measure 10 to 12 in. on the under shell and are worth dressing. They are shipped to Baltimore, Philadelphia and New York in great numbers to help out their aristocratic relative, the diamond-backed terrapin of the salt marshes in his, or her, attempt to provide terrapin stew for epicurean palates at \$1 per taste, for the rapidly disappearing diamond-back now costs from \$60 to \$100 per dozen for "counts," i. e., females which measure 6 in. on the under shell. As the extreme size is 8 in., and males seldom reach five, is it any wonder that the sliders desire to get into such company and be served to guests in evening dress who know that choice old Madeira is the only admissible beverage with terrapin stew?

I have several recipes for terrapin stew (for this princely reptile is never in the soup) two of them given me by the late Sam Ward, America's most famous bon vivant, but that's another story.

After the soft-shells, which are unknown east of the Great Lakes, come the sliders, but none have the gelatinous flesh of the terrapin as the diamond-back is called. Then the snapper comes next, and no others except the big land gopher of the pine lands of the South are worth notice as food. The Northern land tortoises are poor and stringy.

A snapping turtle weighing above 15 lbs. should be skinned, because its skin may retain a trifle of the musky odor which is exhaled from the animal in quantities proportioned to its size. If under that weight it may be scalded and the outer cuticle rubbed off; of course having been beheaded long before. Then turn the turtle on its back, separate the under shell from the upper at the joint and cut out the under shell or plastron. Then remove the department of the interior, saving the liver, with care in excising the gall, and then you will see that neck, legs and tail are about all that is left, and you

learn much when you try to separate these from the upper shell, or carapace. Opening a sardine can with a penknife is nothing to it, even if you have a butcher-knife and a hammer. After you have the neck, legs and tail unjointed, there is still left a bit which should not be thrown away.

A turtle is curious in its anatomy; part of its skeleton is inside and part outside. It does not shed its shell, like a crustacean, but the shell grows in plates, with sutures like those of the human skull. Each rib is attached to a plate of the carapace and to the vertebrae below. Between the ribs and the upper shell lies the tenderloin, and to get it each rib, which is the only soft thing in the skeleton, must be cut and the connecting membrane skinned out.

With wholesome meat of any kind some sort of fry, roast, broil, soup or stew can be made, but the subject is too large to even touch upon in a pound-net where so many things are found.

Mr. Mott asks: "Has the fresh-water turtle any enemies, the human race excepted?" The question would imply that there was only one species and does not permit a categorical answer. His reference to taking small turtles from black bass and frogs apply only to infantile specimens whose shells are very soft and are easily digested by fish. After a snapping turtle gets to be 8 in. long, man, or one of its own kind, seems to be the only thing that can kill it; possibly the same may be said of the savage soft-shell species. But the raccoon catches and eats the smaller pond turtles, and digs them out of their shells. I have never seen a coon do it, but have found where it has been done, with coon tracks as very strong circumstantial evidence. Since writing this I have been asked to go into the turtle question in *extenso*, giving all American species, marine and other, with recipes for their appearance on the table. Perhaps it may be done.

Making Long Casts.

A correspondent asks: "What is the weight a trout rod should be to get the longest distance casting in trout fishing—caster 5 ft. 9 in. and 160 lbs.? My 10½ ft. 10½ oz. for bass is too heavy for trout. I have 6 oz., 7 oz. and 8 oz. rods, but they are too willowy to handle a long line in bad conditions."

I have a 10½ oz. split bamboo that is 10½ ft. long, and it has cast 90 ft. in other hands. The records in Central Park and other places show that 50 z. rods have cast further. Therefore, it is not the weight of the rod nor its length that makes it lay out a line so far. It is entirely in the action of the rod with the know-how behind it. No slim-jim, limber-go-shifless kind of a rod could get there, no matter who was behind it; there must be backbone that springs to it when trained muscles call for a supreme effort, or the records will not be approached.

Then, the line must fit the rod and be a heavy one: heavy in the middle, for you can't throw a nickel as far as you can cast a silver dollar; there must be weight up to a limit, to anything we can throw. Personally I have no use for light lines, because I use a stiff rod, which will not cast them. I have several rods, one as light as 6 oz., but my 10½ rod is the only one I use for trout, bass or anything; I would like to tackle a 20 lb. salmon on it.

I do not class the 40 z. rods as toys, because I have seen what work they can do in the hands of P. Cooper Hewitt and other amateurs; my preference being merely

Series of six pictures. First Prize in the FOREST AND STREAM's Amateur Photography Competition.

that the heavy rod tires my arm and gives me a muscular exercise that I would not take voluntarily. It does me good, is dumb-bells and Indian clubs, and has forced me to cast with my left hand. As my left arm has always been weak since the boxing lessons of boyhood and my frontier life of forty years ago, I regard this enforced use of it as a blessing. This is, I think, the first plea in favor of heavy rods in these later days, when the great double-handed trout rods of the last century have become curiosities. While the left soon tires with casting, it is a relief to the right. A young man may strengthen his arms with many devices, but an old man will not take exercise for exercise sake; therefore, the heavier rod is my favorite, for the reasons given.

It is better to put a heavy line on a light, whippy rod than to give a good stiff rod a light line. The whippy, double-action rod, which kicks back when you throw it forward, may be good for those who like that sort of rod, but it will never send out a long line, and I prefer an alder cut from the bank.

Of course our ordinary trout fishing with the fly, is done within 40ft., but many an angler has seen a trout rising beyond that distance when he could not get nearer, and then he wishes that he had the power to make a long cast. It is in preparing for such chances that the intelligent angler wishes to know how to get there. There is no royal road to this learning, nothing but practice beforehand, on the old motto: "In time of peace prepare for war." I like a heavy line and do not believe that its descent on the water alarms a trout, as it strikes some 20ft. away and then unfolds roft. more; the ruffling of the surface is nothing if there is a slight wind making a ripple on the water, while if the surface is still the effect is such as we often see when a gentle puff of air from above strikes the water and moves forward in a wedge-shaped ripple. (See remarks on page 231, last week.) Trout are never alarmed at a falling leaf or twig, nor by the motion of insects on the water; these things they see every day. This makes me an unbeliever in the theory of casting lightly as a thistle-down. What trout fear is the moving shadow of a man or beast on the bank; the waving branches of the trees they know all about.

The Coming Trout Season.

To-day the wind is east, and there is fog, mist, rain and hail alternately in the air. No need to say, "Hail, gentle spring," for it will do it without invocation, and then the rheumatism in that left knee and right shoulder! Yet it all belongs with the spread that spring lays out, and why not accept it philosophically? A fellow who can take things as they come to him in this world and is glad that they are no worse, has all the elements of happiness that are in sight. But this is largely a matter of temperament, as is the disposition to grumble. An optimistic view of things brought me through where others died—but that's not related to the opening of the trout season—yet it has a relation to the selection of trout-companions.

It was not on the waters of the "Bigosh," which the Minnesota maps call "Winnebigoshish," of Itasca county, but on a trout stream of Sullivan county, N. Y., that the thing occurred. It was June—

"And what is so rare as a day in June?
Then, if ever, come perfect days;
Then heaven tries the earth if it be in tune,
And over it softly her warm ear lays."

The trout were rising fairly well and the birds were doing their level best to tell how they enjoyed life as Lowell has described a June day. We lunched at noon and fished an hour, when up came a thunder storm. We trudged through it over three miles of muddy roads, soaked and sodden; shoes ruined and hats wrecked. On the way I tried to make light of the affair, but my companion would have none of it. After a change of clothing, a dinner and a rainbow in the east, my friend remarked: "It's always my luck to be caught in this way and get a soaking, and you made it worse by making fun of it; what fun there was in it I can't see, getting soaked through and spoiling all the cigars in my coat."

On returning to the city I sent this man a box of cigars with a note of commiseration for his sufferings and his loss. His hide was so thick that he asked me to fish with him the next year; but we did not fish.

Where to Fish?

Lest any reader should think that this heading might tell him of prolific trout streams somewhere between New Brunswick and Oregon, I hasten to say: The question is a personal one. An invitation to spend a week at a club where the trout are plenty, but just shy enough to make angling that uncertainty which constitutes its charm to such sportsmen as regard the pursuit of game, and not its capture, as the highest form of sport, has been reluctantly declined. The man who says: "I can fish if they bite fast" may be an estimable citizen, but he misses the spirit of the angler. Walton tersely expressed it when he said: "Angling is somewhat like poetry; men are to be born so."

Then there are other invitations to wet a line in private waters, none of which can be accepted, because I am so chained to business that two days from home just now is my limit, and if my fly is dropped on some Long Island stream at the opening of the season for a day or two it will be joy enough, and thanks have been sent to the kind friends who remembered the scribbler who has a new book—there, I almost said it—but the fact is that there is a big grindstone running, and my nose is on it.

A note from John Patterson, of Ozone Park, N. Y.,—golly, what a name—who has a fishing station at Goose Creek, Jamaica Bay, Long Island, says that the first flounders were taken there on March 15, and promises to keep me advised about their biting, but when the trout season opens the flounder is no temptation. Later in the summer at Patterson's there is sometimes good weakfish ground, as he is near the Broad Channel, the Raunt, and other good grounds, as Goose Creek is the first railroad station on the trestle which crosses Jamaica Bay from Brooklyn to Rockaway Beach. Sometimes other game fishes run in there, but the flounder and the fluke live on that submerged meadow called Jamaica Bay, and hundreds find recreation in catching them, if the sport is not exciting.

Unios for Bait.

In FOREST AND STREAM of March 11 I had something to say of the fresh-water mussel as food. Without any reference to the question of food, "Matasiso" writes of the unio as bait for fish. He says:

"I sat down this evening to compose my mind before going to bed and picked up 'Men I Have Fished With' for the one hundred and seventeenth time (more or less, for I have not kept tabs on the record; but I read it on

an average of once a week, when somebody has not borrowed it). As I read about your old chum Steve Martin (vide page 142), I noted that George Scott experimented with fresh-water clams (unios) for bait.

"I wonder how many fishermen have tried that? If we could go into executive session and moralize over the past what funny experiences we could rake out of the cinders of the old furnaces of fun. But the spirit moves me suddenly to tell you of an incident that occurred in the fall of 1897, in fact, during the same trip to Plymouth, Mass., when I wrote you about 'Nesmuk'."

"I was with S. B. Duffield, Jr., a young and promising artist, and our tent was pitched on a bluff, about one-eighth mile distant from the nearest cart road; and our duffle had to be jackassed (you see I am acquiring Matherisms) that distance through the woods to the lake shore, and we had a tussle getting the canoe in. So we did not get settled and ready to go fishing till afternoon of the second day. Of course, when we started, we found that bait was scarce; we were after yellow perch for supper, and wanted minnows for bait, and not a blamed 'minny' could we find.

"Duff thought we were counted out, and made up his mind for fried bacon; but we got the canoe in the water and I reached down and pulled in a dozen unios.

"What in blazes are you going to do with those things?" says Duff.

"Use them for bait."

"Well, I'll give you my hat, if you get any fish with that bait."

"Now, my boy, you can sling paint and make pretty good johnny-cake; but your Uncle Dudley can show you how to 'catch fish.' 'Tis not the desire for food that calls the fish, but the way you put it before them. If you know how to do it, you can catch fish with a bit of salt pork, if the fish feel like biting, and if they don't, you could not catch a fish with the nicest bait in the country."

"Now, I would rather catch a perch on a rod with a pretty little reel than to land a 4lb trout with a cordwood pole, so I rigged the split bamboo, stuck on a bit of clam, and started in. I had pulled in three or four nice little perch, and found, on baiting up, that I had only a soft bit, which would not stand much chewing; so after throwing in my line I laid the rod across the gunwales and stooped over to open another clam. Suddenly the reel said 'click,' and I grabbed the rod just in time to keep it from going overboard, and the reel kept on with a click-click-c— which, being translated, means 'bass.'

"Now, Duff, though a thorough sportsman, did not know much of bass fishing, so I observed: 'Get your line in and get hold of that paddle, and don't be more than a week about it, either; and if that fish makes for the boat to go under it, you shove her ahead a length, so I can pass the line over your head.' The bass breached so near the boat that he flipped the spray into my partner's face. But I was engaged for a circus just then, and he got the paddle. The bass showed his breeding for a few minutes, and then started for the boat, while I reeled in for dear life. But the canoe did not move, and as the tip of the rod crept down toward the butt I mentally sighed and thought the rod was gone.

"About the time the two extremes met; the bass concluded he had enough and he came up, and I led him to the stern of the canoe. 'Now, Duff' said I, 'you slip that landing-net under him and lift him into the boat, but don't touch the line.'

"Under went the net; but it did not envelop the fish, and he slipped out, but had not strength to break away, and I led him back, and to my horror Duff dropped the net, took hold of the line, and before I could catch my breath stuck his finger down the fish's mouth, and throwing him into the bottom of the canoe, fell on him to keep him from jumping back into the water.

"I then and there offered a few pertinent remarks on methods of landing fish, and I fear offered up a few prayers for his soul's 'illfare,' but he had the fish.

"There was no means of weighing the fish, but it furnished a meal for the pair of us, and there was some left. I presume he weighed between 2 and 12 lbs. I do not dare to estimate closer, for fear you would question my veracity."

"Matasiso" is one of those well-meaning fellows who start in to tell you a story and get switched off on another track. He began to tell of the use of unios for bait and then ran into a bass fight, but as we all do the same thing when we get excited, it's all right. He did, however, show that he took some perch and one bass with this neglected bait.

Trout Flies.

A "Novice" writes: "I will fish for trout on Long Island in April and go to the Adirondacks in June. What flies would you recommend?"

For Long Island in April take the alder, black prince, grizzly king, Montreal, stone-fly, yellow Sally, coachman, queen of the water, green, brown and gray hackles and red ibis. It is the fashion to scoff at the red ibis

because it is like no living thing. The charge is true, but the trout take it at times, and who is to say them nay? For Long Island have these flies dressed on sprout hooks, Nos. 8 to 10. With this outfit you have an assortment of colors to fall back on in case the trout do not care for your first offering. Three of each kind will be enough for a week if you take care of them and do not snap them off or hang them up in the bushes beside the stream, which are ever hungry for flies and take them more freely than the trout will.

For the Adirondacks in June take sprout hooks, but larger, say 4 to 6, and the following flies: Alder, brown hen, coachman, royal coachman, Rube Wood, cowdung, gray drake, Montreal, professor, queen of the water, white miller, yellow Sally, oak fly, the hackles and the red ibis. When you select your flies pay for good ones. Take the ibis, for example; a white feather dyed red is as good as any in the shop; but one day's fishing and drying in the sun and the color is gone. The natural feather does not fade with a wetting, but it will cost more. Tackle dealers must keep cheap stuff for people who want it; but if you go to a reliable house and if you do not know just what you need, tell them so and trust them to fit you out. A novice cannot tell whether a lot of flies are worth \$3 a dozen or only half a dollar, because he is not a judge of workmanship nor of the value of the materials.

Therefore I say to "Novice," keep away from department stores and Bowery pawn shops when you buy fishing tackle, and go to some dealer who makes that his business. He understands his trade, and is not catering to those who want split bamboo rods for \$1 nor flies at 25 cents per dozen, for he knows that no man can make reliable goods at these prices.

If "Novice" should hook a good trout on a cheap fly and have the thing come apart after journeying to a trout stream, he would find that it was not always economy to buy low-priced stuff; yet there is a demand for such trash, and the supply naturally comes; but, when a fellow pays carfare and hotel bills for a few days' fishing, it is the wildest kind of extravagance to buy a lot of low-priced—not cheap—rubbish to bring him disappointment just at the supreme moment which he has dreamed of, and for which he has expended time and money.

My Fishing Bicycle.

Editor Forest and Stream:

It is not intended to intimate by this caption that my bicycle ever fishes. Toledo has one man whose piscatorial tales are told with the especial purpose of seducing the credulous and unwary, but this narrative is not in that category. What I wish to remark, however, is that as a part of the outfit of the stream fisherman, at least in the semi-civilized portions of the country, the bicycle is certainly a most valuable auxiliary, and it seems strange that its utility in this respect is not more generally recognized in the current fishing literature.

Toledo has two excellent streams available for small mouth bass-fishing, the Maumee, whose nearest accessible point for fishing purposes is about twelve miles above the city, and the Raisin, which empties into Lake Erie some twenty miles to the north, running approximately eastward for a distance of twenty miles above its mouth. Both these streams are reached by rail at the distances named, and both have six or eight miles of good fishing water above the villages of Maumee and Monroe respectively. The Raisin is also intersected by a railroad from Toledo, which crosses it at Dundee, some fifteen miles above the mouth (land measure), while there is still about thirty miles of river between the town last mentioned and the lake. Hence, it needs no diagram to show that from either of the three villages named the bicycle affords a quick and easy means of communication with many a stretch of good fishing water, which in the rapids of these streams can only be worked by wading. My own experience with a fishing bicycle has been quite enjoyable during the two past seasons, particularly on the Raisin. It has been quite practicable to leave Toledo any morning on an early train for either Monroe or Dundee, and on arrival at those places, by a ride of six or eight miles awheel reach water that gave very satisfactory sport, and was far enough away from the more accessible portions of the stream to insure little or not interruption. This arrangement permitted a good day's fishing in waters comparatively undisturbed, and a return home the same evening, a thing that would be possible without the wheel only at a considerable expense.

And this brings me to say that having demonstrated, to my own satisfaction at least, the desirability of the bicycle as a fishing companion, I have just completed a contract with one of the big Toledo factories for a wheel designed especially for cross-country riding, such as is usually found on the majority of the country roads which lead to fishing waters in this locality. The brief description which is here appended is submitted with the thought that possibly it might afford a suggestion for some reader of the paper who is making plans for his spring and summer campaigns. My new fishing bicycle will have 30in. wheels, fitted with 1 3/4in. tires. The sprockets are of ten and twenty-eight teeth, giving a gear of eighty-four, which is high enough for all practical purposes. The cranks measure 7in. and are equipped with swinging pedals. The frame is 24in., and has a drop of 3 1/2in. The saddle is open in the center, padded with hair, covered with black calfskin, and mounted on a flat steel spring, which is capable of sustaining a weight of 200lbs. The rear wheel is covered with a permanent wooden mud guard, and the entire machine will weigh in the neighborhood of 28lbs. Its advantages will doubtless suggest themselves. The large tires will enable the wheels to travel easily through mud and sand where a narrower tire would sink more deeply; the low frame and the drop given bring the rider near the ground, so that he sits little, if any, higher than on an ordinary 28in. wheel; the spring saddle permits of riding in comfort and with moderate exertion over roads that are rough and uneven, while the swinging pedals greatly facilitate hill climbing. I shall be quite impatient when the spring fishing begins till I have given the new fishing bicycle a thorough test.

JAY BEEBE.

TOLEDO, O., March 18.

Fishing Up and Down the Potomac.

Riverton.

What magic in a name! Poor Juliet's argument was intended only to deceive herself, for the mind is a mutoscope, and a name is the nickel in the slot that sets before us the moving pictures of memory and imagination.

At a sale of the personal effects of Samuel J. Tilden, Hon. Wm. Scott, of Erie, purchased some of the wine, among which was a rare vintage of Johannisberger that brought \$36 a bottle. A friend who afterward at a luncheon helped spoil a bottle, still recalls with dreamy delight the suggestion of nectar—that liquid sunshine. How much would it have brought unnamed, or how long remembered?

As the name Klondike stands for gold and cold, so Riverton, to the angler who has been there under favorable conditions, stands for beauty and bass.

To reach it one may go west to Harper's Ferry and take the Shenandoah Valley road, or go south to the battlefield of Manassas and take a branch that makes straight for the Blue Ridge and climbing its steep side by the winding stair of a little mountain brook go through Manassas Gap into the Shenandoah Valley.

Along this route you get glimpses of the higher peaks of the nearby Blue Ridge, Buck's Mountain, Rattlesnake, High Knob and others, and then from the summit of the Gap, near Linden, descend quickly to the river.

Riverton is a little country village, though a crossing of two important railroads. It is nestled in the hills, just where the North and South Forks of the Shenandoah River join their waters, while the Massanutten Range, like a tired giant has made his bed between.

Each river is dammed a few hundred yards above the confluence, and each has its turbine driven mill. We have come to fish the North Fork, for our July holiday, and the landlord, who has been wired instructions as to boats and men, informs us he has both ready.

The thermometer was at 107 when we left town, and it was 105 when we reached the hotel; a hot wave that in a few hours is gone, and as we catch the grateful evening breezes down the valleys, we wonder how people will live in New York when that blast reaches them.

The village night is noisy, for patriotism is exuberant as well in the woods as between walls, but fireworks are exhausted early, and quiet reigns save for some cur across the river suffering with insomnia, which recalls that long ago, when "the watch-dog bayed beyond the yellow Tiber," and one cannot but sleepily regret his ancestor had not died, that we might have peace.

The boatmen are waiting at the door next morning as we come out from an early breakfast, and they take our traps to the dam, where the boats are tied.

We saunter along behind, enjoying the cool air, and our morning smoke, for neither is a believer in the dawn hour for fishing.

Lying in the dust of the main street is a sign of civilization—our own, the modern cestus—a pair of iron knuckles, some belligerent, bloodthirsty, cowardly and careless hand has dropped in the throng of the night before; it is rude of manufacture, evidently forged at some rural smithy, but it is a relic at least, as interesting as a cast horseshoe, and is appropriated to hang upon the wall of our den as a souvenir, as strangely out of place in this peaceful valley as would be a stone arrow-head on the city pavement.

We reach the water and find it green and cloudy; not fit for the fly or anything else, but our exclamations of disappointment and disgust are checked by the boatmen, who declare it is all right; that the pool is that way every morning from the emptied duck pond; that it will soon run down, and that we are to fish above the source of trouble anyway.

As we finish our smoke, going up the long pool, where it is useless to cast, they tell us of an incubating duckery nearby, with artificial ponds, sluices, etc., and numerous feathers on the surface confirm their story, as does a barrel and a box of duck eggs we see later in the water—mute, but loud—that would be the better for embalming, so much are they like the offense of Hamlet's uncle. And this water goes to Washington. But presently we reach a cascade, struggle up over the rocks, and the fun begins. The water is fine and bright, and fish in plenty. We make no record-breaking catch, but the hour is perfect. A broad stream, with rocks and grass-puds and bass; quiet pools and raging little rapids and bass; little coves of backwater, dead and warm, teeming with the red-bellied sunfish, whose fatal ambition leads them to tackle a bass fly wherever they see one. Of course a No. 4 fly is too large for them, but, though many miss, it is not uncommon to get twenty-five or thirty in a day's fishing for bass; but they always go back, unless the boatman wants a mess. And getting the sunfish, it is difficult to make them understand why they cannot as well have the small bass, which the angler returns to the water.

Thomas W. Woodward, of South Carolina, seems to have been the first to attempt to raise bass. His efforts were dated as early as 1857, and are graphically described in an article in the De Bow Review (Vol. XXV., p. 442). In this same article he pays an interesting tribute to the red-bellied sunfish, and evidently considered them an object of sport to amply repay the trouble of stocking ponds with them. He also tells of the warmouth perch; he calls it mormouth, though this may have been a printer's error. The boatman calls attention to a bunch of basket willow, which pushes a tangled mass of roots out from the bank, and an eddy making behind it, shoots a strong current around the point that drops over the rocks in a long riffle to a pool below.

Approaching it quietly, a fly is dropped above to bait the edge of the tangle, but as it reaches the water the head and broad shoulders of a bass appears and—vanish the fly. It is a bigger fish than this rod has ever saved; its record is 5 1/2 lbs., and hope and triumph sing a psalm as the big fish rushes out from cover, and head down, goes over the falls with his first rush. The boat cannot follow, but the angler thinks he can, and hastily rises for a jump. There are but 30yds. of line, and before we get to shallow water, the bass has reached the

end, made one tantalizing leap in the air, as if to exhibit his liberal proportions, in "the altogether," and broke. Hope and triumph disappear, and sorrow broods over the silence unbroken, except by a miscellaneous assortment of language as the limp tackle comes trailing in.

Of course it was the leader parted, and two lessons are to be learned over that have been committed many times before.

First, that with small fish and still water 25yds. of line are enough for a fly-rod, but if there is a chance of a good fish, and there is rough water, less than 50yds. will sometimes lose a fish.

Second, that with small fish and quiet water nearly any leader is good enough, the finer the better, but with a big fish and broken water, the best is not too good.

For perch we have been using for a trace two 3ft. leaders that cost 20 cents a dozen. They are thin, but with 3 or 4oz. of rod and not much heavier fish they serve the purpose. We have tried making our own leaders, but there is little advantage we find. Gut can be purchased in strands at \$2 or \$3 per hundred, but to get round, selected gut that is reliable costs from \$5 to \$10, and as the heaviest is the shortest, one only gets 8 or 9in. out of a length, and a 6ft. leader becomes expensive. Of course good leaders can be purchased ready tied, but they cost 75 cents and upward, and economy prompts the use of the cheaper leader until some disaster like the loss of this fish shows how expensive is the habit of poor materials, for monster bass are like Gratiano's reasons, in the proportion of two grains of wheat in two bushels of chaff, and you seek many days till you fasten one, and you had best be ready then or chagrin and self-reproach will be your bitter portion.

The history of the use of silk worm gut for casting lines is not an old one, but its origin is buried in the mists.

One of the earliest allusions which points to its use for this purpose is in Pepy's Diary for March, 18, 1667: "This day Mr. Caesar told me a pretty experiment of his, of angling with a minnikin, a gut-string varnished over, which keeps it from swelling, and is beyond any hair for strength and smallness. The secret I like mightily." The "gut-string varnished" was probably the silk worm, and its first use as a trace for a phantom minnow.

Dr. Henshall tells of some interesting experiments with one of our native silk-producing moths, in which gut was secured three or four times the length of that from the silk worm and of good strength, but the enterprise seems to have passed the experiment stage.

The new process of making artificial silk from woodpulp or celluloid, producing a gum exactly like the natural silk seems to promise that we may yet have a casting line of any length, and any strength, of any shade and without a knot. Hasten the time. When the easy Southern winter's here, not this one, fails to kill the season's slime in the river, that hideous sign and result of pollution, at low water in the next year every stone is covered, and there streams from some, strands of waving green, yards long, like the hair of Berenice. When the leader strikes it, every knot gathers its load of disgustingly dirty thread, that weight the leader and spoil the cast. It makes a splash on quiet water that rivals that of the fly, and not infrequently invites the attack of some careless fish, though for the most part the effect of such a bombardment is to frighten to cover every self-respecting and wary bass.

HENRY TALBOTT.

The Illinois Seining Question.

Editor Forest and Stream:

Relative to proposed legislation to abolish seining in Illinois public waters, much of interest arises. If you bait your hook with a few sharp questions you will make a catch or two as to existing practices that you hardly expect. One thing is sure: The few large seiners are hungry as sharks for seining to continue. But any man who knows a catfish when he sees it understands that thousands of smaller fishermen's rights are swallowed up in the privileges enjoyed and taken by a few men who happen to be more fortunate in having a little more capital. The waters and fish being public property, this should not be allowed.

A petition against seines and drag-nets, signed by 3,000 Peoria citizens and by 2,000 from towns in the adjoining part of the State, was recently presented to the sub-committee on fish and game; since then the large seiners have appeared before the sub-committee with a counter-petition of 300 names from Havana to Chillicothe. It is our position that these "big" seiners wish to continue the use of seines. Why shouldn't they? The pirate lumberman would not wish to be driven by others from stripping timber from public lands, though the forests be ruined. One man might wish to occupy a common to the exclusion of others. It might be comfortable to him; but the people of the State who own the public waters and the fish therein have something to say, and with their attention drawn to the matter they would the State over stand against destructive seining in a greater ratio than 5,000 to 300 on the petitions.

If you will take these big seiners, you will find that they sweep the rivers and lakes of fish to the practical exclusion of all other people from a profitable business; besides the coarse fish, they take the black bass and game fish in the summer, or by early September, and these go to markets and "salmon" canning factories in the East with the carp and buffalo, and at the same cheap prices. They all use illegal seines, in that the meshes are 1 3/8 to 1 5/8 in. square instead of at least 2, as required by present laws. These facts are generally acknowledged; and if you catch a seiner by the gills, give him no time to wriggle off, but whop him on deck and make him open his mouth, you will very soon get such facts out of him, and many others that throw a flood of light on the destruction of fish and the wrongs of those fishermen who would obey the law.

These seiners, knowing the present outrage on the laws is becoming notorious, have the brass to urge not only that their seines (now often from 1,000yds. to sometimes a mile long) be not limited in length by statute, but also that any size mesh be allowed! Do they fear now that the present laws may be enforced, and that desperate efforts only will save their monopoly?

Do we reflect that seining is prohibited (except in some instances as to portions of rivers forming boundaries between States) in the adjoining States of Indiana, Kentucky, Missouri and Iowa? It is likewise prohibited in many other States, and a number provide for confiscation of illegal seines and nets when found. But in the States named, the case as to rivers and lakes and the existence of carp and buffalo, as well as cat, bull-pout and game fish is similar to that of Illinois. Why is seining allowed here, while it is forbidden about us?

The State makes a large appropriation every year for the protection of fish, and yet twenty firms on the Illinois monopolize all the business there. Other States prohibit seining because seining is an improvident and destructive method of taking fish. The fish in public waters are public property. There is the common right of fishing to be enjoyed by all and not usurped by a few.

Seines, as used in Illinois, are engines of destruction—of fish, of the small-fry, of the rights of the mass of fishermen, of the rights of anglers.

Our seining laws are everywhere violated—are unenforced. They are incapable of practicable enforcement. Proof is difficult. The smaller fishermen, who see the wholesale depletion of our rivers by the "big" seines and their own opportunities swept away are many of them in bondage to the large fishermen, to whom they must sell their smaller catches under present methods. There cannot be said to have been a legal seine used in the whole Illinois River last season.

In his report (October, 1898) the Indiana Fish Commissioner states that in his twenty-one months of office he and his deputies secured 244 convictions for illegal fishing, seized 14,400ft. of illegal seines and turned in \$2,239.96 in fines. This sum exceeded his salary (the large sum of \$900) and all money devoted to the enforcement of the laws (Rep. p. 13, 14). In Illinois, where are the convictions and what money has been collected for fines, not for a year, simply, but say for the last five years? We, from answers from fifteen counties along the Illinois, could not learn of \$100 in fines collected. The carp abounding in Indiana waters, and seines, fyke-nets, set-nets and all kinds of nets (except for minnows) and even set-lines being prohibited, he recommends that seines not exceeding 100ft. in length by 8ft. in width, with not less than 2in. meshes, be allowed (Rep. p. 13). Think of it—not yards, but feet! Short seines would not be open to the objections of the long seines. They could be used by the great number of fishermen, and without so great destruction of small-fry. But the necessity for short seines does not exist in Illinois, where fyke-nets, many other nets and set-lines are legal. Such nets are not allowed in Indiana, Kentucky, Missouri and Iowa, where the carp abound. Yet they forbid the seine.

Also Arizona, California, Colorado, Dakota, Ohio, Vermont, and several other States make seining and drawing of nets unlawful (except in some instances as to boundary rivers and certain named rivers; as to the Great lakes and tide waters special provisions are of course made). Wisconsin and Michigan have stringent laws.

In 1898 the river was stripped of fish in July and August, so that from September and on seining was at an end. The thousand fishermen on the Illinois had little to take in their fyke-nets and by other legitimate means. The angler was restricted to perch and small cat.

What an absurdity to appropriate \$10,000 per year for propagation of fish for destruction. Our rivers swarm with the young of bass and other game fish, but they are destroyed before reasonable growth.

These are admittedly the facts. They say when water is high the carp come in from the Mississippi and pass above the dams again. Other States about us, having rivers like ours, tributary to the Mississippi, and fed therefrom, make wanton practices unlawful.

The long seines at every draw destroy hundreds of thousands of small-fry, dragged and frightened into the grass, mud and roily waters where they die. Many fishermen, who have means of knowing, declare that often a million of small-fry are killed at one draw. Thousands of small fish that would escape easily through the meshes, but of unlawful size to take, are frightened on in advance of the large fish thrashing near the seine to escape and are taken or left on the shore to die.

Under present methods the great catch is in the summer, when the price of fish is low; through the later season up to winter, when prices are high, there are few fish—thus we have a great economic loss. During all this time the numerous smaller fishermen everywhere are out of business or eke out a bare subsistence. Without seines, all could be employed and make money with a large output of fish at fair prices. The present vicious system is partial to a few capitalists and prejudicial to all others. The public property is seized by a few. Our commissioners cannot patrol the whole State; they see the large seiners and the smaller fishermen are disregarded necessarily.

Statistics are put forth to show 8,000,000lbs. of coarse fish, carp and buffalo, taken in a season. These same statistics show a small quantity of bass and game fish. The statistics are unreliable. The statistics are exaggerated as to coarse fish and diminished as to the better class of fish. There is design in this. The effort is to show the bass and game fish as gone from our waters—that therefore the seining should continue so that carp and buffalo may be sent to market—to the Eastern markets, including "salmon" canning factories! Large seiners have furnished these "statistics."

The statement for 1898 shows 43,000lbs. of black bass taken in the State, yet 30,000lbs. were taken at one haul near Henry. At an early haul just above Peoria 2,100 black bass were taken. The seining continued and thousands of people in the vicinity of Peoria, taking recreation and seeking a mess of fish, took with hook and line no bass last year to mention.

What is the remedy? Strike at the root of the evil—abolish seining. Such a law will be of easy enforcement, for proof is easy and before the eyes of all interested.

If it be said that short seines will be of no use in some of the large lakes and portions of the large rivers, that is as it should be. No need that the whole territory should be stripped. Give the fish a little chance; no need to take them all. Let other fishermen do business in some places, at least, and give people seeking recreation a show.

It is said by a seiner that the carp, after spawning, go back down the rivers if water be not too low so that they

cannot get over the dams; that therefore the seiners should be allowed to take them. That is it—let none escape! While the facts are not with the gentleman, we have only to carry the argument a step further to show its enormity. If all fish are to be taken, put nets across the mouth of the Illinois, for instance, and at other points, after the carp have gone up, and pen them in.

Give fyke-nets and set-nets, etc., a chance—with smaller meshes, that bull-pouts may also be taken—and make fishing profitable for thousands instead of a hundred of our citizens. There is no destruction of the small-fry in these methods—a well recognized and understood fact. These set nets and the like can be seen and examined by anybody, and illegal nets found. Provision should be made for destruction of illegal nets and good-sized fines imposed. Let us be "business" in all this matter.

Our honorable Fish Commissioners say that "in no State in the Union has nature bestowed a more bountiful supply of waterways adapted for fish than Illinois." (See Fish Propagation and Protection, p. 1, by N. H. Cohen.) Speaking of black bass and the successful stocking of streams in the Eastern and Middle States, the same authority adds: "With our great resources there will be no difficulty in producing similar or even greater results, as our natural facilities in Illinois are far in advance of those of the Eastern and Middle States." (P. 13.) Yet the argument of the few large seiners is that the bass are doomed, and carp and buffalo occupy the waters and (few) want to be allowed to take them.

Some say improvident anglers take bass below dams in spawning season and thus cause great destruction. If so, let the law be made to stop it. But whenever a large catch is made by an angler the story spreads and often grows with the story-teller. It would take a greater number of these catches than you have ever heard of for any one season to cause a destruction equal to that of one of many a day's seining in the Illinois.

Mr. Cohen again remarks: "If these fish (black bass) were left undisturbed for the period mentioned, in five years the streams would be alive with game fish." (P. 14.)

So if the present dead-letter part of our laws, attempting to prohibit seining with meshes less than 2in. square, were abolished and seining (except for minnows) were absolutely prohibited, the people, the fishermen and the angler would be blest and the commercial output would soon exceed its present amount and value. The market output is now a few hundred thousand dollars. The product should soon be several millions of dollars.

As Mr. Cohen, in his pamphlet says (P. 2): "Shall they (the Illinois waterways adapted for fish) go to waste and become barren, or shall they have protection and reach the maximum of their primitive condition?"

Any communications may be sent undersigned.

JOHN KELLY.

713 Third St., Peoria, Ill.

Kit North as an Angler.

CHARLESTOWN, N. H., March 24.—*Editor Forest and Stream:* Your entertaining correspondent, Mr. Henry Talbott, falls into an error when he says that Christopher North (Prof. John Wilson) was not an angler. He was taken in by Wilson's "bamming" (short for bamboozling), in which all the writers for Blackwood indulged to a great extent, and in which he delighted to represent "Christopher" as a senile old man. The first angling literature I ever read, when a boy, more than sixty years ago, long before I ever saw a copy of Izaak Walton, were Wilson's papers in Blackwood, since collected as the "Recreations of Christopher North," and the next, was Sir Humphrey Davy's "Salmonia," and these tended to confirm a natural inclination, which has lasted me through life. Later, I read various other angling reminiscences, scattered through the "Noctes Ambrosianæ," many of them given as coming from the mouth of the Ettrick Shepherd, Hogg, who Wilson delighted to simulate. If Mr. Talbott does not know it, let him read the "Memoirs of Christopher North," by his daughter, Mrs. Gordon. It is one of the most delightful books of biography I know of, and I will quote a few pages from it. I will not dwell on his raptures over his fish, described on page 3 of the memoir, when he was only three years old, for I have several times referred to it in my letters to FOREST AND STREAM, but will pop on to page 140; which describes his plunging bodily into Loch Awe to save a huge trout, which he had hooked on a weak line. Page 141 gives an account of his mode of fishing, as ostensibly described by the Ettrick Shepherd, in the "Noctes."

"In he used to gang, out, out, out, and even sae far out, frae the point of a promontory, sinking aye farther and farther doon, just to the waistband o' his breeks, then up to the middle button of his waistcoat, then to the verra breist, then to the oxters, then to the neck, and then to the verra chin o' him, sae that you wannered how he could fling the flee; till at last o' a' he would plump right out o' sight, till the Highlander on Ben Cruachan thocht him drooned. No he, indeed; sae he takes to the sooming, and strikes awa' with ae arms; for the tither had haud of the rod; and could ye believe't, though it's as true as Scripture, fishing a' the time, that no a moment o' cloudy day be lost; ettle* at an' island a quarter o' a mile aff, w' trees, and an old ruin o' a religious house, wherein beads used to be counted, and wafers eaten, and mass muttered hundreds o' years ago; and getting footing on the geen sward, or the yellow sand, he but gies himself a shoke, and ere the sun looks out o' the cl'ud, has hyuckt a four-pounder, whom in four minutes (for it's a multiplying pim the cre'tur' uses) he lands, gasping through the giant gills, and glittering wi' a thousand spots, streaks and stars, on the shore!"

This is, of course, exaggeration; but to say that the man who could write it was not an angler, is like saying that Milton was not a poet, nor Daniel Webster an orator. Let us quote Mrs. Gordon's more sober language:

"With him the angler's silent trade was a ruling passion, he did not exaggerate to the Shepherd in the 'Noctes' when he said that he had taken 150 trout in one day in Loch Awe, as we see by his letters that even larger numbers were taken by him."

On the next page, in a letter to his wife, he says: "What a fishing! in one pool I killed twenty-one trout, all of them about 2lbs. each, and have just arrived in

*Aims for.

time for dinner at Craig, loaded so that I could hardly walk."

To show that the passion did not fade out, I will again quote Mrs. Gordon, on page 446, of "North in 1845," omitting mention of the long pedestrian excursions in the Highlands, of his earlier years: "How now do his feet touch the heather? Not as of old, with a bound, but with slow and unsteady step, supported on the one hand by his stick, while the other carries his rod." * * * "He surely will not venture into the depths of the water, for only one hand is free for a 'cast,' and those large stones, now slippery with moss, are dangerous stumbling blocks in the way. Besides, he promised his daughters he would not wade, but on the contrary walk quietly with them by the river's edge, then gliding 'at its own sweet will.' Silvery bands of pebbled shore, leading to loamy-colored pools, dark as the glow of a southern eye, how could he resist the temptation of near approach?"

"In he goes, up to the ankles, then to the knees, tottering every other step, but never falling. Trout after trout he catches, small ones certainly, but plenty of them. Into his pockets with them, all this time maneuvering in the most skillful manner, both stick and rod; until weary, he is obliged to rest on the bank, sitting with his feet in the water, laughing at his daughter's horror, and obstinately continuing the sport in spite of all remonstrance. At last he gives in and retires. Wonderful to say, he did not seem to suffer from these imprudent liberties." Does this read like a man who was no true angler, or in whom the love of the sport had died out?

Not to be tedious, I will turn to the closing scene, on page 456, of Mrs. Gordon's "Memoir": "Certain it is that the 'Mearns' came among those waking dreams, and that he gathered around him, when the spring markings brought gay jets of sunshine into the little room where he lay, the relics of a youthful passion, which with him never grew old. It was an affecting sight to see him busy, nay, quite absorbed with the fishing tackle scattered about his bed, propped up with pillows; his noble head, yet glorious with its flowing locks, carefully combed by attentive hands, and falling on each side of his unfaded face. How neatly he picked out each elegantly draped fly from its little bunch, drawing it out with trembling hand along the white coverlet, and then replacing it in his pocketbook, he would tell ever and anon of the streams he used to fish in of old, and of the deeds he had performed in his childhood and youth. These precious relics of a bygone sport, were wont to be brought out in the early spring, long before sickness confined him to his room. It had been a habit of many years, but, then the 'sporting jacket' was donned soon after and angling was no more a delightful dream, but a reality, 'that took him knee deep or waistband high, through river feeding torrents, to the glorious music of his running and ringing reel.' Is not this a pathetic picture of an angler's death-bed? I could not wish a better one, when my last cast is made, and my own lines wound up forever.

CHICAGO AND THE WEST.

Light in Indiana.

Mr. Arthur M. Davis writes a very welcome letter from Cartersburg, Ind. It is very comforting to hope that this great angling State of Indiana is to have more adequate protection, and Mr. Davis' pride is very pardonable. He goes on to say:

"Enclosed you will find a short synopsis of the fish law passed by the late Legislature of this State. I have read your space in FOREST AND STREAM very carefully the past few weeks, hoping to find some mention of our efforts to secure a decent law for Indiana, but as you have said nothing about it, I suppose it has not been brought to your notice. At last we have secured a law that, with proper enforcement, will probably be the means of bringing the numerous small streams and rivers of the State back to their former high standing as bass waters. All former laws had practically no provision for their enforcement, but now with a good commissioner and the means at his disposal for enforcing the laws, we may hope to see at least a few of the hoard of trammel netters, dynamiters, etc., who have been the means of depleting our bass streams, brought to book for their miserable ways. Let the FOREST AND STREAMERS know that old Indiana is at last awakened and will, from now on, be found in the company of other States in the protection of her game and fish.

"I have read your articles in FOREST AND STREAM for several years, and they have been almost like personal letters to me.

"I am preparing for quite an extended canoe and camping trip on White River the coming summer, and if I can pick up any items that will be of use to you, would be glad to furnish them. White River covers a part of the State one seldom sees mentioned in the sportsmen's papers, though it abounds in numerous splendid fishing streams and some good shooting country."

One of the best features of the new Indiana law is the appointment of a "Commissioner of Fish and Game" to hold office four years, though the office carries a salary of only \$1,200 a year, with the additional amount of \$1,200 for traveling and office expenses. Here, of course, is the weak point of the law. No man can for any such sum properly cover a fiftieth part of the State of Indiana. There are good clauses on pollution of streams, dynamiting, seining, etc. I regret to see that seines are licensed from July 1 to Sept. 30, and trot line fishing is allowed with fifty hooks on a line. Spearing seems to be prohibited, and a limit of 24lbs. of bass is set for each day. Fishing of all sorts whatever in the months of May and June is prohibited, and I advise all Chicago anglers who intended to go to Indiana on an early angling trip to paste in their hats the memorandum that no legal fishing can be done in Indiana until July 2, not even by hook and line.

E. HOUGH.

1200 BOYCE BUILDING, Chicago, Ill.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

New Brunswick Trout.

FREDERICTON, N. B., March 25.—*Editor Forest and Stream:* I have received a good many letters lately from sportsmen inquiring about trout fishing in this Province. As the Legislature is now in session, and this is one of my busy times, perhaps you will permit me to answer all of these inquiries very briefly through your columns. I cannot undertake, at this time, to enter into detail as to the almost innumerable streams in this Province where trout are numerous. They are also plentiful in nearly all the inland forest lakes. Perhaps there is no better trout fishing to be found in the world to-day than in many of the lakes and lesser streams at the headwaters of the Tobique (both right and left-hand branches), and the Nepisiguit. The fish run from 2 to 4 and 5 lbs. Togue, or land-locked salmon are also plentiful in some of these lakes. July and August are the better months in which to come, as the mosquito is on the grounds with his spear in June. Parties wishing guides and canoes can write to George Armstrong, Perth Centre; Adam Moore, Scotch Lake, or Alex. Ogilvie, South Tilley, and feel perfectly certain of receiving square treatment. Edward Norred, Boiestown, is an excellent man to write to if one desires fine trout fishing in the Rocky Brook and Sisters Lake region.

By the way, I think I can settle this question as to how many cubs are produced by the female black bear. Henry Braithwaite says that the animal only breeds once in every two years; that as a rule the litter is composed of two or three cubs, though he caught a bear last spring that had four cubs with her. He says that he has found the new-born cubs in January and also in March, showing that there is no regular mating season; also that he has seen plenty of undoubted evidence that the old bears, especially the males, frequently destroy their young. Henry knows.

FRANK H. RISTEEN.

Lake Ontario Salmon.

ROCHESTER, N. Y., March 25.—*Editor Forest and Stream:* In the edition of March 18 Mr. Redmond gives some interesting information in regard to the former existence of salmon in the waters of Irondequoit and Braddocks bays.

In July or August of 1896, while fishing in one of the channels of Irondequoit, near the Float Bridge, I caught a fish weighing about 2 lbs., with slate-colored back and silver underneath, said to be a salmon. He took a 4in. minnow, and was a strong fighter. I have not heard of one being caught since.

Some Reasoning Dogs.

"I HAD a funny experience to-day," remarked the Colossal Liar, as he made room for his feet near the cheerful camp-fire. The Story Teller pitched an armful of wood upon the blaze, while the Major said, staring straight up into the clear sky, "Looks as though it might blow pretty soon."

"Yes, sir, the most funny experience I ever had; I went over to the little pond (which, be it known, lay about a quarter of a mile behind our camp, in the woods), thinking that I might possibly get a few trout in there. I don't like this bass fishing, anyway; it's too dum lazy, paddling around in a boat all day, only making a cast now and then. You know where the little point juts out about two rods on the south side?" Nobody said a word. "Well, I thought I would stand out on that point, where I would have good, clear casting into the best water; if there were any trout in there, I wanted them."

"I sat down at the edge of the woods, rigged my tackle, and then stepped out on the point. There is a strip of tall grass on the beach, and looking over it I saw one of these 'ere long-legged cranes; he seemed to be asleep, and before I thought I swung my rod and made a lashing cast that carried the line whirling around his legs. He gave a wild screech of surprise, like a woman who has been caught bathing, and started to fly. Then I realized what a scrape I was in. He took that line out faster than it ever reeled off before, and the first thing I knew he was at the end of his rope, and I was hanging on to that rod for dear life; it sprung and bent like a blade of grass, and for one blessed instant I thought the good old friend was a goner. Then old long-legs seemed to lose heart, for he fell with a splash into the water. Say! You never saw such an exhibition of ground and lofty swimming in your day and generation. He spluttered, and spluttered, and splashed around there, with sometimes his head out of water, and sometimes his heels, for a full ten minutes, and would have drowned, I guess, if I had not hauled him ashore, hand over hand."

"He lay still on the sand for a second or two, and I began to consider what on earth to do with him. All at once he started off on a dead run along the beach, like a greyhound. Say! I laughed to see him go it; he put me in mind of Old Redoubtable, there, the day he ran afoul of the hornet's nest. The old idiot had somehow got the line tangled around his legs and wings, so that he could not fly again; but the way he made three-toed tracks in the sand was a caution; and all the time he was yelling and squalling to frighten the devil. Of course, that fun could not last long; pretty soon the line caught around something solid and snapped, and away that fool bird ran faster than ever, and yelling like a scared dog; he's going yet, I know, and he won't stop to-night, either. Ha! ha! ha!" and the Colossal Liar threw back his head and made the woods ring with peal on peal of laughter, in which we all came in strong on the chorus.

"So of course you did not get any trout?" said the Story Teller.

"Get any trout? Say! It was all I could do to get home; I had to stop every rod and laugh an hour over that performance. Ha! ha! ha!"

Then the Inveterate Fisherman joined the circle; he had just come in. "Say, old man," said he to the Liar, "I took your rod to-day; my tip needs splicing; but I knew you were off with your gun, and wouldn't use it. Hope you don't mind, especially as I brought home a few nice ones."

The Colossal Liar straightened up with a jerk; then, seeing some warlike preparations on the part of the Major, he suddenly had business away from the vicinity.

"Cussed Ananias," remarked the latter, wrathfully, as he threw the club which he had seized upon the fire; "making me laugh till my sides are sore over a fool lie that did not come near enough to the truth to impose on an idiot."

And out on the water a loon yelled in the moonrise, "Ha! ha! ha!"

D. F. H.

NEW YORK.

Dogs in Great Britain.

Now our big New York show is a thing of the past, having won the congratulations of all concerned, a glance at the report of the big show held by Mr. Crofts, at the Agricultural Hall, Islington, London, may reveal many interesting items to your readers.

The show appears to have been successful even beyond former exhibitions, the attendance very great, the low cost of admission, sixpence only, between the hours of 6 and 10 P. M., no doubt attracting the dog lovers of the humbler classes, who are numerous over the water.

The gross number of entries numbered 3,435, and among the classes we notice the name of some breeds that are practically unknown among us, even by old fanciers, like myself, who left the other side in the days of our youth.

Griffons Bruxellois had 36 entries, but this dog is a stranger to me, and probably is to many others. I should say it is a small dog, as one class was for "not over 5 lbs."

Maltese had 17 entries, as many as the mastiffs, that grand old British dog. Airedale terriers, the breed that is just now interesting our terrier lovers, had 82 entries, and the class attracted much attention.

Roseneath terriers, whatever they may be, had 16 entries. Whippets, 35, and one solitary Clydesdale appears. This last is beyond me, but we must live and learn, and probably in a year or so we shall have a large class of Clydesdales in New York. The more the merrier. Who knew the points of a Boston terrier a few years back?

Speaking of Boston terriers, Yankee Boy's win at New York was very pleasing to our Boston fanciers.

Retrievers had 117 entries, and to judge from the sales columns in the London Stock-Keeper, the breed is very popular in England, and much used in the field. Of bull dogs, 166 entries show how much the breed is liked. Toy bull dogs had 60 entries, rose ears the rule.

Collies, with 245 entries, were the largest class, and this breed is very popular. A good deal of discussion is going on over there of the matter of faking ears.

Beagles were small in number, but the breed is highly esteemed, the sale of a pair for 100 guineas being mentioned in the Stock-Keeper. Beagles under 10in. seem to be growing in favor; indeed, all the small breeds have a boom, as they have classes for toy bull terriers.

Elkhounds had 19 entries. What manufactured breed is this?

WOMBAT.

BOSTON, March, 1899.

Points and Flushes.

The famous Irish setter Finglas, owned by Mr. W. L. Washington, died on March 25. He was one of the importations from the kennels of Rev. Robert O'Callaghan. He had some reputation as a field trial competitor, but his chief reputation was founded on his long list of bench show winnings made at shows of importance in almost every city east of the Rocky Mountains. He was by Fingal III out of Aveline.
